To the Editor of The Nation:

Sir: What sort of outrageous nonsense is this letter anent instructors' salaries by "A. Grocer"? And why this nom-de-plume? Surely, no grocer would describe his trade as "catering merely to the beast in man." Has A. Grocer forgotten the fable of the belly and the members?

And what sort of argument for a uniform wage scale for different instructors is the uniform price of two copies of the same paper? What A. Grocer should ask is whether any sane man would object to paying three cents for the *Evening Post*, for example, however many "shrilly voices" cried yellow *Journals* for a cent. Can any thinking man doubt the depressing effect on energy and initiative of any system that fosters a uniform wage scale? Are we not all familiar with the union labor cartoon appearing from time to time in different dress, but showing always the sad-faced, intelligent mechanic shackled to the incompetent loafer? Does not every college man know the vast difference in the energy, brains, and devotion to duty—in the money value to the college, in short—of the members of a faculty? Why, only recently the president of, perhaps, our greatest university was heard to say that he recognized so clearly this difference in the money value of his teaching force that he thought some of his professors had a "negative" value—meaning that they ought to pay the university for the privilege of burdening it with their mediocrity.

No parallel can be drawn between a college and a business house. Yet, since the attempt is often made to justify the management of the one by the methods of the other (I have heard of a trustee who deplored, at an alumni banquet, this cry for an increase in professors' salaries, because he hadn't a man in his employ who didn't work longer hours with less pay!), it may be permitted us to doubt whether a good business man ever lets an energetic, valuable employee know that he can never hope for a "raise." Is it not, then, an anomaly that the keen business men of which our boards of trustees are for the most part, and for obvious reasons, composed, should deliberately chain the earnest, energetic worker to the sloth, to the man of "negative" ability, whose work for the college is over when he leaves his class? The present tendency unquestionably is to equalize professors' salaries even though such equalization necessitates reducing the pay of the fortunate few who have been drawing more than the present limit.

The *Nation*, always moderate in tone, is disposed to look on the bright side of the situation. "In New England," it tells us, editorially, "the conditions are not yet actually painful"; "frugal families manage to lead a tolerable existence." There's a goal for ambition! But the professor must not mind this frugal existence, he should be superior to the ordinary creature comforts that go to make life worth living, and then he can "quicken his mind by travel." On what? On a professor's pay? Not unless he leaves his wife and children at home. But is not his wife an equal? Does not her soul, too, need quickening? Or shall the women, whose influence for good in this society of young men should be incalculable, be reduced to mere household drudges

whose one preoccupation is how to make both ends meet? How can you have the "choicest society in the world" if the women are neglected; if they haven't the money to travel or entertain, the time to visit or to read? Nor is it quite true that one of the compensations of the professor's life is his freedom of speech. If he has outgrown his early creed, he had better keep the fact to himself. On account of the younger students it may be better so; but it is so, unquestionably.

What young man of first-rate energy and ability, of scholarly tastes, but human—there is no essential connection between scholarly tastes and long-haired, emasculated, poverty-stricken pedantry—what man of scholarly tastes, but without private income, will become a professor if he knows (and if his professor is honest he will tell him) that not only he but the woman of his choice and their children will be forced in their youth to live, I do not say without the comforts, but without many of the necessaries of life, and in their old age in abject poverty, or, if haply the excellent Harvard plan is generally followed, on the bounty of the trustees? If education is worth while at all, will men of means be willing to confide the education of their sons to second-rate men rather than pay a living wage to the best? Shall the noble profession of teaching be given over to mediocrity, celibacy, or wealth? Shall we endorse Matthew Arnold's definition of the profession—"that most perfidious refuge of men of letters"? M. T. ENAR.

Notes.

In April the Macmillan Co. will have ready 'The Faith of Men, and Other Stories,' by Jack London.

'Impressions of Japan,' by G. H. Rittner, with the author's own photographic illustrations, is about to be brought out by James Pott & Co.

From Harper & Bros. will issue 'The Standard of Pronunciation in English,' by Prof. T. R. Lounsbury; 'Memoirs of a Baby,' by Josephine Daskam; and 'Breaking into Society,' more fables, by George Ade.

Spring announcements of the Grafton Press are a 'Handbook of Princeton, New Jersey,' by John Rogers Williams; a 'Handbook of Columbia University, including Barnard College and the Teachers' College,' by George H. Butler, jr.; 'Along the Nile with General Grant, with an extended account of Ancient Egypt,' by Elbert E. Farman, LL.D., then United States Consul-General to Egypt; 'Our Political Degradation,' by General Rush C. Hawkins; 'Echoes from the Glen, in Divers Keys,' verse by William Page Carter; and 'Underneath the Bough,' by George Allan England.

The well-known book and art-publishing firm of Gerhard Stalling of Oldenburg is preparing for the St. Louis Exposition a unique 'Goldenes Buch der Deutschen,' which will contain a collection of signatures of the German Emperor, the leading German rulers and princes, the mayors of the free cities, and hundreds of prominent savants and artists. After the close of the Exposition, the book is to become the property of the Germanic Museum of Harvard University, "as an abiding memorial for all the Germans in America and their descendants." A second copy of the book will be on exhibition in the German House in St. Louis, and all the Germans who visit the place are expected to enter their names. This copy—as it were, "a monster pedigree-book of the Germans in America"—is to be presented to the German Emperor.

The Eastern contest naturally gives a fresh interest to works, already issued, even remotely connected with it. Mr. Meredith Townsend's 'Asia and Europe' (Putnams), which, as we pointed out three years ago, is a bundle of Review essays in the nature of generalizations on the differences between Western and Eastern natures, is not largely or weightily concerned with Japan. Indeed, the name does not appear in the table of contents, which yet has two chapters on "The Future of the Negro" and "The Negro Problem in America." Still, what we are witnessing in Asiatic waters is, as we have recently declared, a conflict between two civilizations, and Mr. Townsend's book may well make part of our general reading at this hour.

The appearance of a fourth edition of Mr. Alfred W. Pollard's 'English Miracle Plays, Moralities, and Interludes' (Oxford: Clarendon Press; New York: Henry Frowde) indicates the solid and enduring qualities of this annotated collection of specimens of the pre-Elizabethan drama. Revision and addition in the light of the latest scholarship enhance the value of the current issue, as well as a liberal number of illustrations from fifteenth and sixteenth-century sources. "Everyman," we remark, is one of the pieces in this book.

A work of similarly approved excellence is Col. A. A. Woodhull's 'Notes on Military Hygiene, for Officers of the Line'—but also for a much wider class, as we observed in an early notice—is just put forth in a third edition by John Wiley & Sons. It has been considerably rewritten.

Finally, the late Prof. George M. Lane's 'Latin Grammar' has been reprinted, with changes and corrections, and the chapter on Sound both rewritten and extended by Professor Oertel of Yale (American Book Co.). One wishes that so much valuable matter could have been less compacted by the use of small type and close lining.

The well-known 'Memoirs of Madame Vigée Lebrun,' in a slightly abridged form (translated by Lionel Strachey), have been brought out by Doubleday, Page & Co. The abridgment is for the sake of making the book uniform with the 'Memoirs of the Countess Potocka' and 'Memoirs of a Contemporary' published by the same firm. The volume contains a great number of pleasing reproductions of Madame Lebrun's paintings.

Roger Ingpen's title, 'One Thousand Poems *for Children*' (Philadelphia: George W. Jacobs & Co.), affords ground for discussion in detail, but still more the subtitle: "A Choice of the *Best* Verse, Old and New." Since the selection includes nursery rhymes, fables, and riddles, a high quality cannot be predicated of it as a whole. Yet it is not to be despised, and its comprehensiveness will recommend it to many parents as a thesaurus for reading aloud at least. The classification is not quite scientific, as the section "Insects, Birds, and Beasts," for example, could be reinforced from other divisions, especially the opening one called "Rhymes for Little Ones." Here will be found the whole of "John Gilpin," of "The Pied Piper of Hamelin," Gray's "Elegy," and other longish pieces. There are Ballads, and Hymns, and Humorous Verse, in which we might have looked for Dr. Holmes and certainly for Lewis Carroll, but they are unrepresented. Longfellow yields more than any other American poet. Poe surpasses Lowell and Emerson. Whittier has but one extract, and this is fairly significant of the difficulty of making children's reading of him. We have observed no carelessness in the reproduction, but the typography is second-rate.

Colonel Arthur L. Wagner, Assistant Adjutant-General U. S. A., publishes in a thin volume (Kansas City, Mo.: Hudson-Kimberly Publishing Co.) a lecture upon 'Strategy' which he has delivered at recent encampments for manœuvres of the officers of the regular army and the National Guard. He defines strategy as "the art of moving an army in the theatre of operations, with a view to placing it in such a position, relative to the enemy, as to increase the probability of victory, increase the consequences of victory, or lessen the consequences of defeat." To illustrate and emphasize his definition, he refers freely to the campaigns of the civil war in the Middle West, notably those of Sherman, and gives especial attention to the new conditions of modern warfare introduced by railroads, telegraphs, newspapers, and smokeless powder. The discussion is simple, clear, and interesting, excellently suited to the needs of officers of the State Guards, and calculated to incite hearers to the study of military history.

Prof. James Orr's 'David Hume and his Influence on Philosophy and Theology' (in Messrs. Scribner's "World's Epoch-Makers") will have its uses, although it by no means fills the corresponding want. It does not explain the state of opinion in England when Hume's Treatise was written nor when his Essays appeared, while the criticisms with which half a dozen chapters are filled, written as if Hume were a writer of yesterday instead of being separated from us by half the breadth of modern thought, are somewhat unprofitable. Really, if we say the book is not quite useless, it is the most we can say.

The fifth edition—largely altered since the third—of D. K. Clark's 'Mechanical Engineer's Pocket-Book' (D. Van Nostrand Co.) is a painstaking and meritorious work, containing some information not elsewhere easily found. It is an amazingly handy little volume, whose dimensions of 6x4x1 inches embrace 692 beautifully printed pages. Unfortunately for use here, it is adapted to practice in England.

'The Mechanical Engineer's Reference Book,' by Henry Harrison Suplee (J. B. Lippincott Co.), is a new book intended for American use. It measures 7x4¼x1¼ inches, and contains 837 well-printed pages. Its contents have been made up with excellent judgment, and we should incline to believe it the most practically useful of its species. But a new compendium, unless extraordinary pains have been taken with it, and especially with the proofreading, is liable to vex its user with occasional errors. Here, for example, on page 67, one hundred U. S. gallons are said to equal 478.53 litres. Risteen's 'Metric System' (Hartford Steam Boiler Inspection and Insurance Co.), which

has the best tables, makes the figure to be 378.679, which is substantially correct. This number has been, as it should have been, deduced from the rule of procedure of the Office of Weights and Measures. The definition of the gallon as 231 cubic inches merely shows what the gallon was intended to be. Mr. Suplee's decimal supposes it to be exact, which must not be assumed.

'Whittaker's Electrical Engineer's Pocket-Book,' by Kenelm Edgcumbe (Whittaker & Co. and the Macmillan Co.), is a charming little book, though it might advantageously have enlarged upon its 456 pages. Intended for English service, it will have its utility here.

The "Collezione Novati," published by the Istituto Italiano d'Arti Grafiche of Bergamo, has been increased by the publication of a facsimile of a superb MS. in the Musée Condé at Chantilly, containing a hitherto unpublished metrical treatise of the fourteenth century, 'La Canzone delle Virtù e delle Scienze,' by Bartolomeo di Bartoli of Bologna. The poem itself belongs to the allegorical type well known to mediæval students in such works as Brunetto Latini's 'Tresor,' Matfre Ermengau's 'Breviari d'Amor,' or even the 'Roman de la Rose,' but the codex reproduced furnishes an even more valuable addition to our knowledge of early Italian art. The exhaustive introduction and notes of M. Léon Dorez of the Bibliothèque Nationale, under whose direction the work is published, give all the details necessary for the comprehension of its literary and artistic setting.

Science, poetry, history, and industry are all represented in the contents of the *Annales de Géographie* for January. The analogies between whirlwinds and whirlpools are shown with a view to the examination of the theory (known as Baer's Law) that the tendency of the rivers in the Northern hemisphere to turn to their right is due to the rotation of the earth. The completion of V. Bérard's great work, 'Les Phéniciens et l'Odyssée,' leads the editor, M. Vidal de la Blache, to support his contention that in the poem we have a true picture of the geography of the Mediterranean in the time of Homer. The great maps of Waldseemüller, on which the name America first appears, are described by L. Gallois; and an engineer gives a suggestive account of the present condition and future possibilities in France of "la houille blanche," or water-power converted into force by electricity. Other subjects treated are the rainfall of La Vendée, the structure of the soil of Austria, the ever-present cotton question, and the attempts to introduce the cultivation into European colonies and dependencies.

The *Sun Trade Journal*, a monthly illustrated magazine published in Tokio, mostly in Japanese, with a few pages in English, contains for January, 1904, besides its usual array of rather poorly executed photographic reproductions and numerous articles in Japanese on subjects of interest relating to the world at large, a map of Mantchuria. This seems to be a reproduction according to scale of the very large and handsome one issued last year by the Japanese War Department. While the old names are given in Chinese, the newer places and all the stations of the Russian railroad, both main lines and branches, are in *kana*. The highways, large and small, are also expressed in similar fashion. While possibly of no great value for the region of the seat of immediate war, the map itself and its markings even of obscure villages and of caravan lines through the desert regions give one a vivid impression of the thoroughness of the knowledge of the Japanese of this part of Asia. Any common soldier in the Mikado's army, without being able to understand the speech of the continental natives, or to be understood by them, can with pencil and paper, stone and slate, or by scratching upon the ground with a stick, communicate easily in Chinese characters with the village headmen or persons of ordinary acquaintance with the ideographs which are in common use over all eastern Asia, and with which one can write English about as well as Japanese. Doubtless, in every Japanese knapsack will be found a copy of these War Department maps of Korea and Mantchuria, which in reduced form are sold in Japan for half a dime or less.

Apart from its interest to the student of modern phases of religion, the book of nearly 500 hymns and tunes, together with the Japanese national anthem, entitled 'The Hymnal,' prepared by a large committee of native and foreign musicians (Tokio: Keisei-sha), is worthy of notice for particular reasons. It was once so far believed that the Japanese vocal organs were unable to master the diatonic scale in use in the Occident, that two American musicians began the preparation of a special scale and notation. To-day we find hundreds of our ordinary tunes, some quite elaborate, in this finely printed book, which is issued in several editions, one with the words only, one with words and music combined, one with the tonic sol-fa soprano added to the staff notation, and one in Roman characters with each tune indicated by a few opening notes and a photographic reproduction in reduced size of the ordinary music. So, also, in instrumental music the Japanese have made great progress; besides the pianos, organs, and cornets found in the churches and schools, the military bands now play foreign music as a usual thing. A full brass band played by natives is the new feature at temple festivals, picnics, and outdoor gatherings generally. It will be recalled that the late E. H. House, under Imperial patronage, trained a picked body of young men and rendered oratorios of European composers.

A markedly increased interest among intelligent people in Germany in the institutions, industrial conditions, and history of the United States is noted in a recent consular report. Among the titles of several new books on American topics are 'Das Land der unbegrenzten Möglichkeiten' (The Land of Unlimited Possibilities), by Goldberger; and 'Das Land der Zukunft' (The Land of the Future), by Polenz. In the newspapers and magazines an unusually large space is being given to letters and articles on social, educational, and industrial subjects. The general tone of these writings has been "friendly and appreciative." Perhaps the most significant fact is that, in the Universities of Berlin and Heidelberg, during the present university year, lectures are being given on the history of the United States. "This has marked a departure in German university instruction, and will greatly stimulate interest in the subject."

The contoured topographic map sheets issued by the United States Geological Survey during 1903—most of them on a scale of one or two miles to an inch—bring out forcibly the physical features of many parts of the country. The most peculiar sheet is Hayden Peak, Utah, which shows the crest of the Uinta Mountains to be a narrow and irregular backbone, reaching heights of 12,000 or 12,500 feet, between a series of glaciated amphitheatres on the north and south; adjacent amphitheatres being separated by rib-like spurs from the backbone. The Saypo (Montana) sheet exhibits a remarkably fine example of "trellis drainage," in the longitudinal and transverse arrangement of the streams in the Front range of the Rocky Mountains. A curious contrast is presented on various sheets between rivers that are competent to follow the vigorous curves of their valleys, and rivers that meander on a smaller pattern than that of their valley curvature. Among the competent rivers, the Raystown branch of the Juniata in central Pennsylvania, the Meramec in eastern Missouri, the White in northern Arkansas, and the Vermillion and the Black in northern Ohio, are good examples; while the James in South Dakota, and the Mississippi, between Missouri and Illinois, are striking cases of incompetence in this sense. The James is a relatively small stream that wanders with most uncertain course on its valley floor; and the Mississippi, large as it is, seems unable to swing in harmony with the great curves of its flood plain, between the bluffs on east and west.

—Col. Higginson's paper in the current *Atlantic* deals with "Books Unread" in his usual interesting way, lapsing occasionally into a slip of memory, as where he rewrites two lines out of four in quoting the best-known stanza of Whittier's "The Eternal Goodness." Professor Carter of Princeton contributes one of the best estimates of Mommsen which have appeared on this side the ocean since the great scholar's death, calling special attention to the happy blending of the training and temper of the jurist with the best qualities of the philologist which he brought to his researches in Roman jurisprudence. Recognizing the exaggerations, the easily demonstrated lack of impartiality, in the author's one popular work, the 'History of Rome,' Professor Carter does not regret that "Mommsen read Roman history in the light of the nineteenth century, and studied contemporary politics in the light of Roman history." It is a wholesome truth neatly expressed that "learning can ripen into knowledge only in the sunshine of opinion." William C. Dreher's review of the past year in Germany lays special stress on the rapid growth of the Social Democracy, and predicts the ultimate success of the movement at the polls. The fear of German disaster in the world's markets from American competition is not now so acute, he tells us, as it was a few years ago.

—In the death of Francis Boott last week, Harvard University has lost her oldest living graduate but one, and Cambridge one of her most marked social figures. Mr. Boott was born in Boston in 1813, educated at the old Round Hill School at Northampton, under George Bancroft and Mr. Cogswell—a school of which his reminiscences were much less rosy than those of some others of his generation (Thomas G. Appleton's,

for example)—and graduated at Harvard in 1831. Modest, averse to commercialism and struggle, and devoted to music, he went, shortly after his marriage with Miss Lyman, to Italy, where, soon losing his young wife, he lived for many years, devoting himself to the training of the daughter whom she had left him in passing away. The full history of this experiment in education would be interesting, for the total result was a triumph. Old dwellers in Florence grew familiar with the sight of the handsome American carrying his daughter on his arm while she was still an infant, and afterwards with her always at his side. He taught her music and singing and the four modern languages, and accustomed her ear to Latin by reading the Vulgate aloud when she drew or painted. She was a receptive pupil, and grew into an extraordinarily well-informed and accomplished woman. The recumbent bronze statue of her which her husband, Frank Duveneck, placed over her tomb, is one of the ornaments of the Cemetery at Florence, and marble replicas of it exist in some of our American museums.

—All his life, even to the end of it, Mr. Boott composed music, most of it secular song-music, but much of it church-music, including masses, anthems, and chorals. Many of his religious pieces may be found in the Boston King's Chapel service-book. Perhaps the most widely known of his airs are an Ave Maria and a Maria Mater, and the songs "Here's a Health to King Charles," "Lethe," and "When Sylvia Sings." Boott's taste in music was for simple effects, and he was loyal to the Italian forms of composition. He never got reconciled to Wagner, and still less to his successors. He also had a poor opinion of the native aptitude for music of the Yankee branch of the Anglo-Saxon race; and one of his favorite topics of conversation in later days was the insincerity, as he always termed it, of the Boston Symphony Concert audiences, forever straining after culture, but really unable to know whether they genuinely and organically enjoyed what they heard or not. Mr. Boott was faithful, as few men are, to his own life-long tastes and ideals. Although scholarly, he was not erudite, yet his reading in many tongues, his good memory, and especially his acquaintance with all the Boston literary men of his time, and with the English and American colony of poets and artists who dwelt in Italy in the fifties and sixties — the Brownings, Landor, Story, etc., etc.—gave to his talk that rich, old-fashioned allusive flavor which is well-nigh extinct. He had, moreover, an ever-bubbling humor, and his letters were witty indeed. He has furnished book-reviews and various communications to our own columns. One of his cares was for the purity of the mother-tongue. Faithful to his habits, to his friends, to his likes and dislikes, Mr. Boott lived in Cambridge for the past thirty years, and, until two months ago, could be met, with his erect figure and blue eyes, taking his constitutional walk twice every day. Modest, honest, possessing delicacy of every kind in rare degree, but wholly unconventional, his death leaves in his friends' hearts a gap which no younger man can ever fill.

—It is not often that one lays down a modern book with so distinct a desire that there were more of it, both as to each part and the whole, as in the case of 'Politische Porträts,' by Theodor Barth (Berlin: Georg Reimer). Dr. Barth, the well-known parliamentarian and editor of the Berlin *Nation*, has gathered into a little volume a collection of sixteen sketches of prominent personages, all of them, with the exception of Cavour and Garrison, celebrities of his day, upon whom he has pronounced judgment either in the columns of his journal and of *Cosmopolis*, or in a funeral oration or at a memorial celebration. All these sketches, therefore, while lacking the fulness of detail which we expect of the biographical essay, reflect a spontaneity and warmth of sentiment born of the immediate occasion which called them forth. Dr. Barth unites a sane faith in German liberalism with the practical sagacity of the trained observer of men and things in many lands. We are inclined to think that the rapid sketch of Prince Bismarck in these pages, with its sharp contrasts of light and shade, forestalls the sober verdict of the future German historian, just as the article on Gladstone, the longest and most fascinating in the book, presents a clean-cut picture of the British statesman, such as we vainly look for even in Mr. Morley's philosophic volumes. The comparative fulness of this article but emphasizes our regret at the brevity of such sketches (some only four pages in length) as those of Caprivi, Windthorst, Georg von Bunsen, and others. Mommsen, with whom Dr. Barth was closely associated politically, is the subject of a particularly interesting article. Of this intimacy he furnishes a striking instance. At the outbreak of the Spanish-American war a "great international review" asked a number of prominent men for their views concerning the war. Mommsen, who had expressed himself in unmistakable terms, showed Dr. Barth a proof of what he had written. Dr. Barth submitted that, from a journalistic point of view, the article was "a choice morsel," but added that the severe judgment, however justified it might be, of a man so universally admired in the United States as Mommsen would cause great dissatisfaction. Dr. Barth's view prevailed, and the article did not appear. The sketch of Carl Schurz, written on the occasion of his seventieth birthday, is another evidence of Dr. Barth's keen interest in American affairs, and of his intelligent appreciation of the highest aspirations of American life.

—Since his visit to Palestine, some four years ago, the German Emperor has evinced a keen interest in Oriental research. The Sultan, on his side, has recognized the archæological interest of his imperial brother by concessions and gifts of a most unusual character. Of these perhaps the most noteworthy was the concession at Baalbek, where the Germans have excavated and renovated the ancient temples, the expedition at the same time conducting further studies, not only in the neighboring region, but also at Palmyra, in the Hauran, and at Gerash, Amman, and Mesheytta. This last remarkable ruin, which has been visited by but few, on account of its inaccessible position in old Moab, east of the Jordan, beyond the present pilgrim route to Mecca, in the desert, was presented outright to the German Emperor. Under the direction of Dr. Schumacher the remarkable carved-stone façade of the great enclosure of the khan or palace, whichever it may be, has been taken down, boxed, and sent to Berlin, where it is to form one of the adornments of the new Friedrich Museum, which will be opened this spring. The carved stones of this façade filled 462 boxes. This imperial participation has done much to stimulate German interest in Oriental research. A school has been established in Jerusalem for practical Biblical study, and the German Orient-Gesellschaft, of which the Emperor is a member, and to whose work he is one of the largest contributors, in conjunction with the German Palaestina Verein, commenced last spring excavations at Mutesellim, supposed to be the site of ancient Megiddo, on the southern edge of the plain of Esdraelon and at the neighboring Lejjun, the site of the important town Legio, of the Roman period. These excavations were resumed last autumn, after an intermission during the heat of the summer months, but up to the present time have yielded no important returns. An account of these excavations, so far as the results of the work last spring are concerned, is contained in the *Mitteilungen der Deutschen Orient-Gesellschaft* for December, 1903 (No. 20 of the series). The Orient-Gesellschaft is to be commended for the promptness with which it publishes preliminary reports of the work done, as this naturally tends to retain and stimulate the interest of subscribers. The extent of that interest is manifest from the fact that, according to the fifth annual report, just published, the income of the society for the last fiscal year was some $60,000.

—Besides the excavations in Palestine, successful excavations have been conducted by this society at various points in Egypt and Babylonia. It is in the latter region that the principal work of excavation has been and is being accomplished. This work consists, first of all, in a systematic excavation of the ruins of Babylon, which has now been in progress for five years, with minor excavations and explorations at other sites, Borsippa, the sister city of Babylon, Fara and Abu Hatab, two very ancient sites about three days south of Babylon, between the Tigris and Euphrates. The current number of the *Mitteilungen* contains an account of the commencement of excavations at Kal' at-Shirgat, the ancient Ashur, the original capital of Assyria. Up to the time of the discovery of the Code of Hammurabi, by the French at Susa, in 1901-02, it was supposed that the city of Ashur, and hence the country of Assyria, was founded not earlier than about 1800 B. C.; but the mention of Ashur in that document proved that it was already a famous and important city in the twenty-third century B. C. The discoveries of the Germans up to the present time have shown that the city retained its importance also to a much later date than had been heretofore supposed. Hitherto historians have assumed that, with the construction of Calah and the removal thither of the seat of Assyrian empire, about 1300 B. C., Ashur lost its importance. A succession of palaces has now been found, showing that Ashur continued to be occupied as a residence city by the Assyrian kings into the seventh century B. C., and probably until the time of the downfall of the Assyrian empire; that, in fact, during the whole period of the existence of that empire it remained a city of great impor-

tance, at least from the official and religious standpoint. Further excavations at this point seem likely to contribute valuable material for the history of Assyria.

THE CREEVEY PAPERS.

The Creevey Papers. A Selection from the Correspondence and Diaries of the late Thomas Creevey, M. P. (Born 1768. Died 1838). Edited by the Right Honourable Sir Herbert Maxwell, Bart., M.P., LL.D., F. R. S. In two volumes. With portraits. E. P. Dutton & Co. 1903.

One hundred years ago Thomas Creevey, M.P., was hobnobbing with Fox, Sheridan and Grey, corresponding on familiar terms with Romilly, Whitbread, and Sir John Moore, and spending a large part of his time at Brighton in the company of the Prince of Wales. Until the day of his death, which occurred at the beginning of 1838, he retained such social status as belonged to a veteran politician in the Whig service and an agreeable diner-out. He never held high office or wrote an important book. He was destitute of family connections, and almost wholly destitute of money. If one may judge from his correspondence, he had little claim to the title of wit. His assets in life were an alert intelligence, an excellent digestion, good humor, and a great fund of animal spirits. Blest with these solid advantages, he went through the world very easily, and collected enough gossip to make up a small library, if all of it were published. Sir Herbert Maxwell, by using his powers of censorship severely, has kept within the limit of two volumes. It is clear that a less scrupulous editor might have extracted from these papers a shocking amount of pure scandal.

Before attempting to criticise Creevey's letters and jottings, we ought to say a few words more about the writer himself. One source of surprise is that, with no greater gifts of fortune or nature, he should have become a welcome guest at the houses of so many distinguished people. Another is that, having lived in the thick of London society for nearly forty years, he should be virtually unknown to history. The 'Dictionary of National Biography' omits his name, and one may search through many volumes of Georgian memoirs without finding any notices of him that are material. The most satisfactory reference occurs in Greville's 'Journal' for 1829, although there is a long passage in the same work under the year 1838:

"Old Creevey is rather an extraordinary character. I know nothing of the early part of his history, but I believe he was an attorney or barrister; he married a widow, who died a few years ago; she had something; he nothing; he got into Parliament, belonged to the Whigs; displayed a good deal of shrewdness and humor, and was for some time very troublesome to the Tory Government by continually attacking abuses. After some time he lost his seat, and went to live at Brussels, where he became intimate with the Duke of Wellington. Then his wife died, upon which event he was thrown upon the world with about £200 a year or less; no home, few connections; a great many acquaintances; a good constitution, and extraordinary spirits. . . . He is certainly a living proof that a man may be perfectly happy and exceedingly poor, or rather without riches, for he suffers none of the privations of poverty and enjoys many of the advantages of wealth. I think he is the only man I know in society who possesses nothing."

This long quotation is worth inserting because information about Creevey is scarce, and also because Greville's description of his character is borne out by the style of his correspondence. If the lines of a portrait can be trusted to show anything, he was droll, and the frontispiece to the first volume is as good as anything in the book. The face is that of one who can make people merry by sheer infection and without the least aid from brilliant witticisms. Such a man, especially if he be single or a widower, is not unlikely to find a welcome in aristocratic circles, and may spend the whole year at the houses of his friends.

Creevey's own letters, interspersed with fragments of reminiscence, form the bulk of these two volumes. The remaining element is represented by the letters of his leading correspondents. It seems probable that some of his papers were got at and destroyed by Brougham. According to Greville's obituary notice, Creevey "kept a copious diary for thirty-six years," but if this ever existed it has disappeared. "Then," continues Greville, "there is Creevey's own correspondence with various people, especially with Brougham, which evidently contains things which Brougham is anxious to suppress, for he has taken pains to prevent the papers from falling into the hands of any person likely to publish them, and has urged Vizard to get possession of them either by persuasion, or purchase, or both." From 1818 forward most of the letters which Sir Herbert Maxwell has published were written by Creevey to his stepdaughter, Miss Elizabeth Ord. As the original handwriting was execrable, Miss Ord kept neat copies, and she clearly felt that these records were destined to be of considerable value to the future historian. At one time Creevey thought of writing a history himself, and the fulness of his outpourings may have been due in part to this intention. Singularly enough, he took little pains to preserve his miscellaneous papers from dispersion or even from destruction. Brougham certainly was not above searching out and burning whatever might be made to illustrate the devious course of his political advance.

A standard of comparison is always useful, and the publisher's advertisement suggests that the Creevey Papers should be grouped with Greville's 'Journal' and Croker's 'Correspondence.' Sir Herbert Maxwell, in his introduction, lays particular stress upon the latter analogy. To us, it must be confessed, the differences seem more striking than the resemblances. The subject is in general the same and the medium of expression is highly similar, but, when we pass on to the question of personality, contrasts at once arise. Greville is studied and systematic. Croker never forgets that he is a Quarterly Reviewer and the founder of the Athenæum Club, which, according to his conception, should include only "gentlemen who have either published some literary or professional work, or a paper in the 'Philosophical Transactions.'" Creevey is far more Bohemian than Croker, and far less stilted than Greville. He has a great capacity for drink, and does not mind admitting it. Greville gambles at cards and on the turf, but is always having compunctions, and intending to improve his mind after the manner of Macaulay. Creevey is frankly epicurean—or, rather, he is a genuine sporting character who feels quite untroubled about wasted opportunities. The nearest approach to a regretful mood which we have observed, is represented by his sorrow that he does not know French better. Writing from Stoke in 1832, he says: "Here are our Greys and Talleyrand and the Dino. . . . What an idiot I am never to have made myself a Frenchman. To think of having such a card as this old villain Talleyrand so often within one's reach, and yet not to be able to make anything of it. I play my accustomed rubber of whist with him."

The most attractive thing about Creevey's letters is the complete frankness of their tone. His remarks upon men and things are often crude, but they are direct and perfectly natural. If he were not so prone to set down small items of tittle-tattle, we should have a real fondness for him. His antagonisms are bitter, especially in the days of Pitt and Fox. Here is a characteristic bit coming from 1802: "God continue Fox's prudence and Pitt's gout! The infamous malignity and misrepresentation of that scoundrel Windham did injury to himself; never creature less deserved it than poor Fox. You cannot imagine the pleasure I feel in having this noble animal still to look up to as my champion." A few months later he writes of Pitt: "I really think Pitt is done: his face is no longer red, but yellow, his looks are dejected; his countenance I think much changed and fallen, and every now and then he gives a hollow cough. Upon my soul, hating him as I do, I am almost moved to pity to see his fallen greatness."

This freedom of speech not only breaks out at intervals, but marks the correspondence from beginning to end. Creevey had entered Parliament for Thetford, a borough which belonged to the Duke of Norfolk, and he retained the seat till 1818, when there was a change of dukes. The new magnate, for reasons unknown, declined to nominate him at the general elections of that year, whereupon Creevey wrote a spirited letter beginning thus: "The question I put to you, Duke, is this—Why have you not noticed me in your arrangements for the new Parliament, or why have you not given me your reasons for not doing so?" He seems to have been independent without being impertinent, and when we consider that for some years his income was restricted to about £200, his candor may be called exceptional. A remarkable and amusing instance of this quality may be seen in his description of a dinner at the Earl of Durham's (vol. ii., pp. 91-92). The passage is too long to quote, but as a commentary on manners the reader will find it worth his examination.

Sir Herbert Maxwell lays stress upon the value which the Creevey Papers possess for the period of Lord Liverpool's administration. The extreme weakness and unpopularity of the Government made it a mark for attacks of every description, but, with all their negative advantages, the Whigs could not manage to clamber into office. "If any evidence," says the editor, "were wanting as to the disunion, and its causes, which sapped the efficacy of the Whig Opposition during the first thirty years of the nineteenth century, it is amply forthcoming in Creevey's letters, and nobody can complain

that it is not expressed in forcible enough language." Of the deeper changes which were going on we hear nothing from the member for Thetford and his friends in opposition. This book, at least, fails to show that the Whigs of the Regency grasped the bearing of the industrial revolution. The agricultural interest felt itself threatened, and this sense of danger held the Tories together; but the Opposition, divided as it was between landowners and radicals, was unable to unite upon any settled policy. The domestic bickerings of the Whigs during the period which separates Waterloo from Catholic Emancipation are mirrored in Creevey's correspondence. The success of the party would have meant cabinet rank for him; its impotence cost him his chance of political distinction, besides being a fruitful source of recrimination between him and his more conservative associates.

When we begin to estimate the worth of these papers as a contribution to our knowledge of social life, we observe one great merit and one conspicuous limitation. A man may be downright in his manner of utterance and yet a very complete liar. There is evidence, however, to show that Creevey was deemed truthful by his contemporaries. His letters are absolutely unvarnished in point of form. He describes what he sees without any reticence, and if he has a comment to offer he employs the phrases which come on the spur of the moment. As an observer of things worldly and material he is admirable. Unfortunately, intellectual problems are absent from his mind, and he has no sense of the spiritual whatever. The ideas and habits of fashionable people come quite within his range. On the other hand, scholarship, literature, and theology belong to a world which he never enters. For example, he knew the coterie of Holland House intimately and could touch off the foibles of Lady Holland as well as any one, but when it comes to the higher flights with which the name of Holland House is associated his letters are a blank. We can imagine that Mr. Creevey felt very bored when conversation soared above the flats of gossip and current politics. Macaulay was exactly the kind of person to stir his bile, and in 1832 he writes with his usual frankness: "Yesterday I dined at Stanley's. Mr. Macaulay and Mr. Gordon were the only other performers after dinner, and two more noisy, vulgar fellows I never saw. Fitzroy Somerset, Kempt, McDonald, and I settled them between ourselves afterwards." Brougham, with whom he kept in close touch, was both a politician and an intellectual. Creevey says much about his wire-pulling, but steers clear of his views on jurisprudence and Greek literature.

Sir Herbert Maxwell has suppressed most of the scandal, and therefore we cannot say how unfavorable may be the picture of English society which is given in the original text. One fact, however, is clear, namely, that we should be going wide of the mark if we suffered our opinion of social conditions to be colored by such a source alone. This statement requires some emphasis, because Creevey's directness creates a stronger impression of reality than is left by the pages of either Greville or Croker. Even under censorship he shows us an unpleasant amount of intrigue and dissoluteness. Possessing a fair share of the primitive virtues, he became a thorough worldling, and, as we have already said, was blind and deaf to the higher aspirations. But if he and his associates were not inclined to be straitlaced, their utterances sometimes have a note of vigor which disarms the most rigid moralist. A short conversation between Creevey and the Duke of Wellington at Brussels will illustrate what is meant:

"In the evening I had a walk with the Duke again in the garden, and upon my asking some question about the Regent, as the Duke had just come from England, he said: 'By God! You never saw such a figure in your life as he is. Then he speaks and swears so like old Falstaff that damn me if I was not ashamed to walk into a room with him.' "

While we shall not attempt to itemize the special passages which have historical importance, attention should be directed to the description of George IV.'s life at Brighton, the account of Creevey's conversation with Wellington on the day after Waterloo, the details given concerning Queen Caroline's case, and the character of Brougham as depicted throughout this correspondence. We have said little about the anecdotes related of celebrated people, for they are less prominent here than in most memoirs of the eighteenth and nineteenth centuries. Doubtless the proportion would have been considerably larger but for the prudence which Sir Herbert Maxwell has shown in the exercise of his editorial discretion. Creevey's stories are usually suggested by his love of gossip rather than by his desire to circulate a polished jest. Hence they do not lend themselves to quotation so readily as do many of the anecdotes contained in Greville and Croker. By way of exception there is this speech of William IV. which may prove interesting for more reasons than one: "Miss Cator told me a very pleasant saying of King Billy about Lady Wellesley. When she was in waiting at Windsor, some one, in talking of Mrs. Trollope's book, said: 'Do you come from that part of America where they *guess* and where they *calculate*?' King Billy said: 'Lady Wellesley comes from where they *fascinate*!' "

Our last word must be that the Creevey Papers, though not a biographical classic, are distinctly valuable, and claim the attention of all who would know the history of England from Fox to Melbourne.

CHELSEA OLD CHURCH.

Chelsea Old Church. By Randall Davies, F.S.A. With a Preface by Herbert P. Horne. London: Duckworth & Co. 1904. Pp. xiv., 319, 18 plates.

'The Ambulator, or Pocket Companion in a Tour round London,' of 1794, describes Chelsea as "a village on the Thames," a description borne out by its representation in Stockdale's beautiful map of 1797, "A New Plan of London, xxix. miles in circumference." In this, we see fields stretching from behind the houses on the river bank to King's Road, here called "The King's Private Road." Scarcely any houses are shown between Horseferry Road and Cheyne Walk. Even to-day, river-side Chelsea retains something of a detached air. There are still remaining a few buildings belonging to the time when Chelsea was yet a village. Old Chelsea lies off the highways. There is no longer a Don Saltero's Coffee-house to attract visitors with its collections of curiosities; the famous Bun House is no more, though the "Chelsea bun" is still sold all over London. Only in the summer-time come many visitors bent on pilgrimage to Carlyle's house, to the church, perhaps also to the two houses where Whistler dwelt. There is an Old-World air about Cheyne Walk. There are gates of hammered iron; one house has a sun-dial built into its front; the passer-by gets glimpses of Chippendale furniture and of old china; some houses bear legends connecting them with Chelsea's history. The Chelsea of the river-side feels that it has to live up to its renown as the "Village of Palaces." Mr. Horne tells us in his preface that "there is scarcely another parish within the environs of London which can boast of so long a roll of illustrious or memorable inhabitants." A chronicler of two hundred years ago writes of them—"the many honourable, worthy inhabitants being not more remarkable for their titles, estates, employments, or abilities than for their extraordinary civility and condescension, and their kind and facetious tempers; living in perfect amity among themselves."

Chelsea is easy of access from the west of London. Swift, who at one time lodged here, writes to Stella that he walks from Pall Mall in something less than an hour; the distance is "two good miles, and just 5,748 steps." The great men had their barges; in the days of his Chancellorship Sir Thomas More had eight watermen. If one hired a boat, the watermen's fare from London was but one shilling and sixpence. Thus it came about that, from the sixteenth century down to the time when it ceased to be a suburban village, Chelsea has always been a favorite resort of those who had business about the King's palace or the courts of Westminster.

Mr. Davies's book is not in form a history of Chelsea, but a monograph on the old church. He has not to tell of Chelsea's glories, the Bun House, the China Manufactory, the Physic Garden, the Hospital, or Ranelagh, though most of these come into the book by virtue of monuments in the church. The frontispiece, a reproduction of an engraving, shows that the church is but little changed since 1788. When the increase of population due to new buildings had quite outgrown the church, it was found, most fortunately, that a new site must be chosen. This was the salvation of the Old Church; a new and hideous structure was erected elsewhere. The author's father has been the incumbent of the Old Church for forty-eight years, and has steadfastly resisted restorations. So it is that we have in this church one presenting old-time features. Certainly, no other suburban church contains monuments of so many illustrious persons.

The church was probably founded before the middle of the twelfth century, but perhaps no part of the existing building dates from before the fourteenth; each succeeding century is represented in portions of its architecture. Two capitals, figured in the book, are believed by Mr. Davies to have been designed by Holbein. It is not, however, the architectural features, but the monuments, which give so great an interest to the church. Of these the greatest historical value attaches to the tomb of Sir Thomas More, the author of 'Utopia,' and one of the noblest victims of Henry VIII. Holbein, who was the guest of More for

three years, has drawn the More family in the Chelsea house. The drawing, of which Mr. Davies gives an excellent reproduction, is now in the Basel Museum; no picture from the drawing is known. The site of More's house is not certainly ascertained. Henry, who was fond of More's society, would sometimes come suddenly to the newly-built house in Chelsea, and after dinner—the dinner hour was then in the middle of the day—would walk in "the fair garden" with his arm round More's neck. More was under no illusion as to the stability of the monarch's affection. To Roper, who congratulated him on the favor shown to him, More replied: "I believe he doth as singularly favor me as any subject within this realm; howbeit, son Roper, I may tell thee, I have no cause to be proud thereof, for if my head would win him a castle in France [for then there was war between us], it should not fail to go." Roper has left us a picture of More's quitting the Chelsea house for the last time: "Whereas he ever more used before, at his departure from his wife and children, whom he tenderly loved, to have them bring him to his boat, and there to kiss them and bid them all farewell, then would he suffer none of them forth of the gate to follow him, but pulled the wicket after him, and shut them all from him, and with a heavy heart, as by his countenance it appeared, with me and our four servants there took boat towards Lambeth."

Sir Thomas More's tomb was erected by himself. The Latin inscription, written by More, says: "And he hath caused this tomb to be made for himself (his first wife's bones being brought hither, too), that every day might put him in mind of death that never ceaseth to creep on him." After his execution, an event which startled and stupefied the civilized world, More's body was buried in the Tower. So much is certain; whether the body was afterwards removed to the tomb in Chelsea Old Church is a question still debated. "Unless," writes Mr. Davies, "established facts are to give place to a romantic tradition, I think it will have to be admitted that the body still lies in the chapel of St. Peter, within the Tower." But, a few lines lower down, Mr. Davies tells us of fresh matter brought to light in 1891, "that goes far towards establishing" the tradition. We, for our part, do not think that the tradition, natural enough in the circumstances, can be received in face of the evidence. More's daughter, Margaret, rescued his head after it had remained exposed for a month over London Bridge (for which she was called before the Council), and buried it "where she thought fittest," probably, says Mr. Davies, "in the Roper vault at St. Dunstan's, Canterbury." Mr. Davies does not refer to the account given in the *Gentleman's Magazine* for 1824 (vol. 94, 1,626) of the finding, in this church, of a box containing the head.

Next to More, the most interesting celebrity of Old Chelsea is Sir Hans Sloane. In 1712 Sloane purchased the Manor of Chelsea from Lord Cheyne, from whose family name we have Cheyne Walk. Sir Hans Sloane was a distinguished physician, President of the College of Physicians, and, in succession to Sir Isaac Newton, President of the Royal Society. To Chelsea, Sloane brought from Bloomsbury his "most surprising museum." This is the name given to it in a manuscript in the British Museum, printed, with the title omitted, in the *Gentleman's Magazine* for 1748. In the manuscript the narrative is called "A Relation of that Magnificent Philosophical Entertainment which Sir Hans Sloane gave to their Royal Highnesses, the Prince and Princess of Wales, on the 7th of June, 1748." We are told that the house formed a square of about one hundred feet on each side. Sloane's collection consisted of minerals, gems, medals, antiquities, insects, dried plants, books, and indeed all manner of things. "Here the remains of the world before the Deluge excited the awful idea of that catastrophe, and are so many evident testimonies to the truth of Moses's history." Somewhat strangely, Mr. Davies does not mention that, after his death, five years later, Sloane's collection was purchased by the nation. The Act of Parliament provided also for the purchase of the Cottonian Library, the Harleian MSS., and "Edwards's additions." These several collections formed the beginning of the British Museum, founded, as the Act states, "not only for the inspection and entertainment of the learned and curious, but for the general use and entertainment of the public." The sum of £300,000 was raised by lottery, and Sloane's collection returned to Bloomsbury, whence it had been transported to Chelsea. The memory of Sloane, who died in his ninety-second year, is preserved by a singularly picturesque monument in the tiny churchyard by the Physic Garden, still one of the glories of Chelsea, established by him, and, perhaps still more enduringly—for place-names outlive everything—by the names of streets, Hans Place, Sloane Street, Sloane Square.

We may apply to Mr. Davies's own book a sentence quoted by him: "This bare skeleton of time, place, and person is fleshed with some pleasant passages"—with many such passages. Space fails us to tell of the chained books, of the bell presented by a grateful traveller who, having lost his way on a dark night and fallen into the Thames, was saved by hearing the church clock strike, and was thus able to direct his course. There is a humorous dispute about a pew, with a request "to forbeare my pue"; references to "a Dogge in a Manger," and threats of "a disturbance in ye house of God" and ejectment by "a strong hand." There is also a delightful account of negotiations at Rome for the marble monument of Lady Jane Cheyne, which, despatched in thirty cases, arrived at Chelsea in January, 1672. Mr. Davies's researches have enabled him to show that the recumbent figure of this monument, the most striking in the church, is not the work, as has been constantly asserted, of "the celebrated Bernini," but of Paolo, his son.

Mr. Davies's monograph must have cost him years of patient labor. He is to be congratulated on having produced a work of enduring value, a worthy record of a most interesting monument of the past. The eighteen full-page illustrations are excellent.

The Story of Byfield: A New England Parish. By John Louis Elwell, D.D. Boston: George E. Littlefield. 1904.

Byfield, as the title of this work imports, is, like distracted Italy a century and less ago, a "geographical expression." Its boundaries include parts of three adjacent towns, Newbury, Rowley, and Georgetown, and its bonds are purely ecclesiastical. Situated at the junction of those Essex County towns, between two rivers, the little settlement found it more convenient to have its own church, and this cement has fully counteracted municipal differentiation. The 'Story' is told in leisurely and scholarly fashion, by a native who has kept at least one foot in the place, with pertinent illustrations and maps, all presented in very attractive typography.

A recent writer, by no means ill-advised, has expressed a wish that "Massachusetts had one museum devoted, not to Japan or ancient Chaldæa, but to things actually done in Massachusetts, by Massachusetts people, for the good of mankind." In such a repository, Essex County would bulk very large, and Byfield's quota would be far from insignificant. If Boston has the oldest school on the continent, Byfield has the oldest incorporated academy, the venerable and stately Dummer, opened in 1763. Claims are also advanced for the first female seminary in the State, and at least its pupils included the wife of the missionary Judson, and Mary Lyon, the founder of Mt. Holyoke Seminary, while Pastor Henry Durant, turning from the ministry to be preceptor of Dummer Academy and then, Yankeelike, a maker of furniture, ended by founding the present University of California. Another part of Byfield's museum exhibit would be the first woollen mill, the first factory for the making of cotton goods, the first machine-made nails and shoe-pegs. But in honored New England stock this little parish has also been rich—Dummer, and Sewall, and Parsons (whence Theophilus Parsons), and Longfellow, and Hale, and Stickney, and Spofford, and Gerrish, and Moody, and many more. As was to be expected from the author, a professor at Howard University in Washington, the scattering colored worthies in Byfield's annals are here commemorated; and in the history of anti-slavery sentiment Byfield's rank is "by way of eminency" (in Cotton Mather's resurrectable phrase). Not to reckon the Rev. Elijah Parish, who merely served as a namesake to Lovejoy, the martyr of Alton, there was Judge Samuel Sewall, author of 'The Selling of Joseph,' a memorable abolition landmark; and a century later Deacon Benjamin Colman, in the first ardor of the Revolution, publicly besought his countrymen to be consistent by emancipating their slaves, found his pastor Moses Parsons too lukewarm on the subject, and, charging him Scripturally with manstealing, became involved in a church controversy lasting five years. There remains a little item in Byfield's church records, in Moses Parsons's own hand, overlooked by Dr. Elwell, which reports among the baptisms:

"Hannah, Daut'r of Joseph Garrison of St. John's River in Nova Scotia, but his wife, a member of ye Chh, here with her child, June 15, 1766."

The wife was Mary Palmer (a kinswoman of our author, by the way—through her grandmother Mary Stickney), and this was probably her sole return to her native place from the Essex County colony of 1763 on the St. John. By a longer ellipse, her son Abijah removed from Nova Scotia to Newburyport in 1805, and presently be-

came the father of William Lloyd Garrison.

The index of Dr. Elwell's handsome and readable volume, with malice towards none, with charity for all, is scarcely adequate for so episodical a narrative.

Addresses, Lectures, and Other Papers. By James Clarke Welling. Privately printed. Cambridge, Mass.: The Riverside Press. 1903.

This volume consists mainly of publications belonging to the later years of Mr. Welling's life, and they are well worth preserving in a permanent form. The author was a lawyer by early taste and training, and later journalist, professor, and college president. He was a constant writer on historical, scientific, and literary subjects, and on questions of international and Constitutional law, but, we believe, never published a book. He occupied in Washington a remarkable position, known not so much for originality as for a sure touch, thorough research, and critical scholarship. As a contributor (the readers of the *Nation* have owed a great deal to him), he had the art of dealing with a subject, however dry, in a fresh and interesting way, and as an historical investigator he had a great gift of weighing evidence—an accomplishment by no means universal among historians. His papers, for instance, on the Mecklenburg Declaration of Independence and on the Emancipation Proclamation will always have value.

This collection is introduced by a biographical sketch contributed by Prof. C. W. Shields of Princeton, in which a very good account is given of the impression produced socially by Mr. Welling. Washington in his time was a smaller capital than it is now, and there were still in it many links connecting the régime of the day with that which had existed before the war. Of these Mr. Welling was one of the more conspicuous. Though he was not a public man, he was one of those whom public men consulted, who went everywhere, and who had his own well-recognized and important standing. It is the fashion nowadays to talk about "cosmopolitan society," as it used to be to talk about the "Republic of Letters." So far as they have yet existed, Mr. Welling was born and lived a member of one and a citizen of the other.

It would be matter of regret if this first-rate collection should be restricted to private circulation, and we learn with pleasure that Mrs. Welling is ready to issue a public edition if a demand for it should appear. Mr. W. I. Fletcher, Librarian of Amherst College, will be glad to hear from any who are interested in securing a copy at $1.50 net.

Life and Adventures of "Jack" Philip, Rear-Admiral United States Navy. By Edgar S. Maclay. New York: The Illustrated Navy. 1903. 8vo, pp. 280.

The subject of this biography won the affectionate admiration of his countrymen through his humane conduct at the close of the great fight off Santiago, July 3, 1898, when, on the deck of the *Texas*, he stopped the triumphant shouts of his victorious and enthusiastic ship's company. The command, "Don't cheer, men; those poor fellows are dying," was a fitting prelude to the solemn gathering of officers and crew in silent thanksgiving for the marvellous immunity from injury which the Americans had enjoyed that day. There are other instances of great reputations based upon a phrase, but in Philip's case the phrase was the keynote of a noble character, and the means by which, unwittingly on his part, public attention was drawn to a career that, leaving nothing to be desired, nothing unaccomplished, stands out as an example abundantly worthy of emulation by the oncoming generation of naval officers. Such a life deserves to be known to all Americans, for it holds out that best of promises, honor and success consequent upon faithful performance of every duty, large and small, "the daily task, the common round," "at the bunt in furling, at the ear-ring in reefing, and close to the block in a heavy drag."

The thread of this memorial, for it can hardly be called more, is Philip's diary of a cruise to China at the close of the civil war. In his own words, written without thought of their coming to light at some future day, a lively picture is gradually built up of that transition period of the navy when sails were yet struggling against displacement by steam. The discomforts and exile of a foreign voyage, and its pleasures as well, heightened as the latter are by the affection of his messmates, are here recorded briefly, yet graphically. Upon the canvas is unconsciously thrown, in unmistakable outlines, Philip's own moral eminence, and his position as the pivot about which the life of the ship centred. There are short introductory and concluding chapters to round out the story, in rather imperfect and uneven fashion. Interspersed are tributes by some of Philip's colleagues and superiors selected for the honor (one is tempted to fancy) for reasons which concern the author more than his subject. Of these tributes, Capt. Mahan's, as portraying Philip's moral worth, "a conscience consecrated to the Divine Service," and Capt. Delehanty's as describing Philip's exceptional technical ability and winning tact—"His presence was felt and reflected in the high efficiency of the ships he commanded. Every officer who has ever served under him, I am sure, will freely testify to the pleasure and professional profit it was to do duty with him; the same may be said of every member of his ship's company, from the highest to the lowest, etc., etc."—are especially pertinent.

The portrait facing page 220 is a speaking likeness of "Jack" Philip, when a commodore; the frontispiece but dimly suggestive.

China, Past and Present. By Edward Harper Parker. E. P. Dutton & Co. 1903.

Parker's China is a very different China from that of Martin, Williams, the Jesuit scholars, the average tourist, the old-fashioned Frenchmen who made out the Chinese to be a nation of sages, or the deists who, for controversial purposes, assumed that the Chinese were identical with eighteenth-century Europeans. Finally, Parker's China is quite another country also from the China pictured in missionary reports and popular stories of converts. Parker is an Englishman with tremendous digestion and leg-power, a stench-proof nose, and notable ability to suffer all things Chinese, whether in domestic routine, diplomatic intercourse or philosophic interchange. He has been pretty well over the Empire and met all kinds of men in the Chinese world, and seems to have equal respect for every sort of religionist. He is pugnacious, in some instances even to the standard of Don Quixote, yet withal so delightfully realistic and unconventional that even his scrap-book style commends itself, while his view is so broad and detailed, and his spirit so honest, that one feels well repaid for reading his book through.

Occasionally Professor Parker—for the once "H. B. M. Consul" is now pedagogue and lecturer at Owens College, Manchester—either is most conveniently blind, or overstrains his own theory; for no one would suspect him for a moment of not being perfectly honest and thoroughly trustworthy—so far as he has vision. For example, there is one well-paraded character, whom he reckons a paragon, and who is set forth as a typical specimen of what a native and unadulterated Chinese may be, or become. In his book entitled 'John Chinaman,' he devotes over four pages to this Canton physician, who "was (or was supposed to be) a Christian, who had taken his medical degree in Edinburgh," and for whom European ladies would loosen their dresses or chemises that he might put his hand or even his ear to their hearts; yet "that was what Doctor Wong did every day." In this, Mr. Parker's latest work, Doctor Wong reappears in two different places and in the same atmosphere of adulation, but in neither book does Mr. Parker mention the little detail that Doctor Wong was taken into his family and educated from early boyhood by the American missionary, Dr. Samuel Robbins Brown. In Macao and Hong Kong, Wong was trained with special care, brought to Munson, Mass., and in all spent about twelve years in an American Christian household and under the immediate eye of this "Maker of the New Orient."

One can easily forgive such little lacunæ for so bountiful a store of information on all subjects, and for a great deal of well-winnowed matter heaped up along those lines of investigation, especially in finance and revenue, which are repulsive or too tedious to most writers on China. Mr. Parker takes us behind the looking-glass on both sides of the room, and points out the shams and the reality, both British and Chinese. What he has to say, it is to be fervently hoped, will be heeded both in London and Pekin. We smart young Occidentals may despise the senile Chinese, but, on the principle that young men think old men to be fools, but old men know that young men are, it may be that, despite all our cannon and railways, the Chinaman will, for a long while yet, cling to his own notions as being the better. Certainly the problem of mutual understanding will be greatly hastened by equal knowledge on both sides.

Apart from his contributions to economics and history, and his lively pictures of social life, garnished as they are by choice anecdotes and piquant bits of experience, Mr. Parker's main contention is strenuously maintained. It is that the Mantchu conquerors of China have done little for the empire or people. They have simply made of themselves another set of parasites, to

draw out of the mightiest single body politic in the world all the fattening substance possible. He declares that, "after two thousand years of political serfdom," it is now high time that "the intelligent and industrious Chinese people, who are excellent municipal and village organizers, should have recognized rights conferred upon them." These political requirements have been crudely specified by Kang Yu-Wei and reformers like him, who have lost their heads or are in exile; but political reconstruction must go hand in hand with material development. It is not possible to give the people newspapers, telegraphs, steamers, and the latest results of progress, and expect them to stagnate peacefully in their old docility and oblivion. On this text, Professor Parker preaches his grand literary sermon with many an illustration in history and statistics. His chapter on the Boxer war is perhaps the best general statement of this episode, on its historical side, that we have. The same praise may be given to his "book" on "the imperial power," and on "The Mandarin, or Official," by which we learn how China is governed. His discussion of international politics and the Far Eastern question is, in outlook and ability, far above the average view or work of British editor or reviewer, for he can view both Russia and Germany very much as, at least, an American can. His amusing and realistic treatment of "celestial peculiarities," as shown in everyday life and religion, and of "the seamy side"—torture, punishments, infanticide, slavery, etc.—proceeds on the idea of getting at the bottom facts and the age-long compelling influences.

His references to Korea, where he spent some months, show that he appreciates highly the American teachers there. While there was a strong political aroma about their proceedings, especially when Japanese assassins and murderers were rather plentiful in Seul (or Sheol, as he speaks of it), he declares that "Korea owes its political existence to their vigilance." He is so happy over his little episode of getting ten British marines landed at Chemulpo to defend the consulate, by means of an unsigned, open piece of paper addressed to no one in particular, that he repeats the same story in this book that he told before in his 'John Chinaman.'

Another specimen of his apparently convenient blindness is seen in his statement: "In none of the Dutch colonies did I see any missionary work; the Hollanders seem to discourage it, impartially and of set purpose." Alas for the earnest and active Dutch missionary societies, the missionary summer festivals and winter conventions, their official reports and zealous missionaries, with which and whom the reviewer happens to be personally acquainted! Even a glance at the 'Statesman's Year-Book' would show that while "entire liberty is granted to the members of all religious confessions, . . . there were, in 1898, 127 missionaries of various societies working to propagate Christianity in the Dutch East Indies."

The map, index, and dates appended to the chapters reprinted from periodicals add to the value of the book.

Principles of American Forestry. By Samuel B. Green, Professor of Horticulture and Forestry, University of Minnesota. John Wiley & Sons. 1903.

The author originally presented, in the forestry section of the Geological and Natural History Survey of Minnesota, part of the material which is well arranged in this volume. We purposely emphasize the term well-arranged, for this fact ought to be brought out prominently, in order that such an excellent book may be distinguished from the chaotic masses of rubbishy material which have often been given to the public, of late, under somewhat misleading forestry titles. There are a few things in the work which one might prefer to change, such as a portion of the nomenclature and some of the terms, and here and there an archaic word, such as "overly," but, on the whole, the handy book fills a real want in a sufficiently satisfactory manner. It will be found generally interesting to any reader who has a fondness for trees in any of their aspects, and especially to amateurs who may desire to know how trees are cared for nowadays on a large scale.

Forestry is passing through a time of peril in this country. Until a few years ago the subject was wholly ignored as a practical affair, being widely believed not to be applicable to our wild tracts of timber. Here and there, there was a voice crying in the wilderness—for instance, the clear but unavailing appeal of Prof. Franklin B. Hough; and certain others tried to make themselves heard in State legislation. But the well-meant efforts of these true reformers were received with ridicule or with deadening indifference by practical lumbermen and by farmers in general. Even the early excellent work in this direction accomplished by the Agricultural Department in Washington was regarded as useless and as child's play. Plainly, the times were not then ripe for such interference with long-established prejudices. Any farmer with a wood-lot and a small area of timber land could show the doctrinaires at Washington that advice which might help a woodsman in Germany would be worthless here.

About the time that the three great processes for the manufacture of paper from wood pulp began to attract general notice, and the steady destruction of certain sorts of trees went on with no intermission, the alarm was sounded in many quarters. The subdued voices of the older prophets gained strength, and younger men joined in the new propaganda. The acquisition of large tracts of forest land by syndicates and by men desiring to possess great estates, gave additional encouragement to the growing enterprise. Besides all this, came also as a very important factor the introduction into the Department at Washington of a modification of the rules governing appointments to service in the forests of the public domain. The way seemed open to young men to gain a good livelihood in a useful and honorable pursuit; and, although the cautions given by the Department are many and wise, an increasing number of applicants appeared. The forest schools are generally well attended, and the new profession has certainly come to stay. But, as has been well said by one who has perhaps more at stake in this matter than any one else in this country, the thing must not be overdone. There is a real danger that the positions of fair emolument may not be sufficient for many years to take the graduates of the new schools. Hard work of an attractive character is the lot of the forester, whereas some of the undergraduates in the forest schools are inclined to think that the hard work can be relegated to subordinates.

The kind of hard work which belongs to the true forester is well set forth by Professor Green in his treatise. The accomplished forester must be versed in many practical applications of pure science, and he must also be trained in that which is most difficult of acquirement—patience while waiting for slow-coming results. It is no easy task to convince a landed proprietor that his forest wealth can be conserved. The changes which a forest undergoes from year to year are so slight as to tax the strongest powers of patient waiting. The successful forester employed by an impatient man must possess very high qualities of tact and good judgment. Professor Green points out in direct fashion the scope of study and activity demanded by one who enters upon the service of our forests, and indicates indirectly some of the great obstacles which stand in the way of success. His work will do something towards lessening the obstacles.

Backgrounds of Literature. By Hamilton Wright Mabie. Illustrated. The Outlook Company. 1903.

The outward appearance of this book affiliates it with the Christmas season, and indeed those in search of a good giftbook might go farther and fare worse, but the book deserves better than to be treated as a mere ephemeron. Its contents would justify a less ornamental binding. The printing by De Vinne is beautiful, and the illustrations are an attractive series. They reproduce photographs appropriate to the successive chapters, except in the case of that on Emerson, where they copy drawings by Elizabeth W. Roberts. Some of these are good, but the picture of Emerson's house "from the orchard" is of a ghostly pallor suggestive of Poe's "House of Usher," and the orchard is represented as inundated by the spring or autumn rains. In one place (p. 6) Mr. Mabie writes as if Emerson's home in Concord was always the Old Manse. Elsewhere he puts the matter right. The mistake suggests different stages of composition, and the book as a whole was certainly not made at one cast. Written at different times, for different purposes, the various chapters lend themselves in various degrees to the illustration of the title under which they are all included. This intends the local setting of each writer whose career is sketched and whose work is judged, and the influence of that setting on the work of each in turn. The intention is best realized in the Wordsworth chapter, which, with apparent consciousness of its peculiar aptness to his title, Mr. Mabie makes the first of his series. At the other extreme stands the Goethe chapter, while for Whitman's "background" we have not so much Long Island and New York city as America in the totality of its strenuous life.

The book is written in the agreeable manner which Mr. Mabie's sixteen other books and his editorial writing have made familiar

to the reading world. It has less force than charm, and too little of that pleasant humor which shines habitually in Mr. Mabie's face and talk. "The Lake Country and Wordsworth" mingles the reminiscences of the travelling author with biography and criticism in about equal parts. Remarkable geography is that of Cockermouth, Wordsworth's birthplace, "in the northeastern part of the lake region, not many miles from the English Channel." Those who have themselves visited the lake country will most enjoy Mr. Mabie's transcription of its beauties to his page, and those who are deeply versed in Wordsworth will best appreciate the manner in which Mr. Mabie relates his poetry to his environment. The criticism does not begin to be so subtle as that of Mr. Walter Raleigh's recent study, but there is nothing here to wail.

The Emerson chapter is one of the better of the many studies that were inspired by his centennial year. Emerson is treated as "the highest type of a mingled frugality of the life of the body and generosity of the life of the mind"—a phrase more rhetorical than the "plain living and high thinking" which it translates. A good comparison is made between Emerson's relation to nature and Thoreau's, and Madam Hoar is quoted: "Henry talks about nature just as if she'd been born and brought up in Concord"—which reminds us of a young girl's objection to Wordsworth. "I don't like him," she said. "He seems to think that he runs nature." By "The Washington Irving Country" the banks of the Hudson River are signified. New York as it was when Irving was a boy is also recognized as an important part of the background of his literary mind, and his seventeen years abroad at one stretch are perhaps minimized unduly. But so is not the difference of his temper from that of the New England coterie. "Weimar and Goethe," as a piece of criticism, is one of Mr. Mabie's best chapters. "The Land of Lorna Doone" is a short chapter, but one of the happiest of Mr. Mabie's illustrations of his leading thought. Next comes "America in Whitman's Poetry," and it is not only the best chapter of these seven, but it is one of the best studies of Whitman that have ever been written, not forgetting Mr. Stedman's in his 'Poets of America.' It is generous in its recognition of Whitman's real merits, without glozing any of his great defects. "The Land of Scott" chapter affords one of the most obvious examples of the background of temporal and local situation as affecting the man of letters. The man who said that he should die if he didn't see the heather once a year deserved and honored his onomatopoetic name.

Clearly, Mr. Mabie has not exhausted his subject—Burns, Browning, Tennyson, Whittier, Bryant, Holmes had their local backgrounds as obviously as any of Mr. Mabie's favored company.

DODD, MEAD and COMPANY

SPRING, 1904

THE NEWEST FICTION

The Day of the Dog

By GEORGE BARR MCCUTCHEON, Author of "Graustark."

A story that discloses Mr. McCutcheon as a humorist of no mean ability. The book is full of genuine humor.

Illustrations in color by Harrison Fisher.
12mo, cloth, $1.25

The Darrow Enigma

By MELVIN L. SEVERY.

A detective story, surrounding the solving of a seemingly inexplicable crime.

Illustrated, 12mo, cloth, $1.50

Strong Mac

By S. R. CROCKETT, author of "Cinderella," etc.

A story of unusual interest,—one that ranks among the best that Mr. Crockett has written.

Illustrated, 12mo, cloth, $1.50

All's Fair in Love

By JOSEPHINE CAROLINE SAWYER, author of "Every Inch a King," etc.

A story that for audacity of plot and terseness of interest can hardly be surpassed.

Illustrations in color, 12mo, cloth, $1.50

The Dayspring

By DR. WILLIAM BARRY, author of "Arden Massiter."

A story of adventure centering around the time of the Paris Commune.

12mo, cloth, $1.50

The Stolen Emperor

By Mrs. HUGH FRASER, author of "Marna's Mutiny," etc.

A story of old Japan. It moves along at a stirring pace, and is replete with interesting adventures.

12mo, cloth, $1.50

Pamela Congreve

By FRANCES AYMAR MATHEWS, author of "When Lady Peggy Goes to Town," etc.

Pamela Congreve is a fascinating heroine whose madcap career is told with Miss Mathews' accustomed vivacity.

Illustrated, 12mo, cloth, $1.50

"Sure"

By EDWARD W. TOWNSEND, author of "Chimmie Fadden"

The same old "Chimmie Fadden," only a little shrewder. The funniest "Chimmie Fadden" book Mr. Townsend has written.

Illustrated, 16mo, cloth, $0.75

A FEW MISCELLANEOUS BOOKS

Japan

Described by Great Writers and Travellers.
Edited by ESTHER SINGLETON.

A book of far greater artistic and literary value than a guide book. The people, their customs, etc., are described by the best writers.

The Double Garden

By MAURICE MAETERLINCK, author of "Wisdom and Destiny."

A new volume of essays, some of which have appeared in some recent magazines.

12mo, cloth, net, $1.40

Outlines of the History of Art

By WILHELM LÜBKE. Edited by RUSSELL STURGIS.

This is the standard book on the subject. The publishers have re-translated the last German edition, and entirely reset the book.

Illustrated, 2 vols., large 8vo, cloth, net, $10.00

DODD, MEAD SPRING, 1904 and COMPANY

ARMSTRONG'S NOTABLE THEOLOGICAL BOOKS

CHRISTIAN FAITH IN AN AGE OF SCIENCE

By WM. NORTH RICE, Ph.D., LL.D.,

Professor of Geology at Wesleyan University.

UNUSUAL COMMENTS

THE BOSTON TRANSCRIPT: "Again the vexed question of the relations between science and religion is the subject of a book, but this time the treatment is from the side of the thoroughgoing scientist. Prof. Rice has devoted his life to science, yet is no less a staunch upholder of the Christian Faith. From such a man we may expect a fair statement of both sides of the question, and we are not disappointed in this volume, which is a clear, succinct statement of the history and present status of the case."

PROF. T. C. CHAMBERLIN, Univ. of Chicago: "I have read the book with the utmost interest and admiration; far and away the best of its kind."

THE OUTLOOK: "A luminously written work."

THE CONGREGATIONALIST: "A frank, informing, courageous book, notable especially for its timeliness."

N. Y. EVENING POST: "The clear style and temperate spirit of this book should commend it as one of the best so far of its kind."

ONE VOLUME, CLOTH, 437 PP., NET $1.50, POSTAGE 18c.

The ATONEMENT AND THE MODERN MIND

By JAMES DENNEY, D.D.

The new Supplement to his great success "The Death of Christ."

"Prof. Denney could hardly have left his remarkable book on the death of Christ without this supplemental dealing with the Atonement. It is not often that we find a book of theological thought and argument which is so readable as this. It goes right to the heart of its great theme."—**THE CONGREGATIONALIST.**

"A profound, though brief discussion, lucid and convincing. No minister, however famous, can afford to be without it."—**THE EXAMINER.**

CROWN OCTAVO, CLOTH, NET $1.00. POSTAGE 9c.

FROM SUNDAY TO SUNDAY

By HANDLEY C. G. MOULE

Bishop of Durham, Author of "Thoughts for the Sundays of the Year." (Now in 16th Thousand.)

This new book, written on the same lines as Bishop Moule's "*Thoughts for the Sundays of the Year*," which achieved such a notable success, is a series of 52 short Sunday readings. Dr. Moule's work has the sympathetic quality that appeals to every sincere man and woman; his thoughts are ennobling and his observations apt and to the point, for they combine his wide learning and evangelical teaching.

The book is specially suited for Easter presentation, and a special edition in white vellum cloth, stamped in gold, with gilt top and ribbon marker, has been prepared. Price $1.75.

REGULAR EDITION CROWN OCTAVO, CLOTH, SPECIAL COVER DESIGN, $1.50.

For sale by all booksellers or the publishers,

A. C. ARMSTRONG & SON,
3 & 5 W. 18th St. NEW YORK.

The McCLURG SPRING BOOKS

Ready in March

A romance by RANDALL PARRISH

When Wilderness Was King

With 6 full-page illustrations in color by THE KINNEYS

The stirring events of the Fort Dearborn massacre in 1812 have long been waiting for some one to use them as material for a novel. Mr. Parrish has made the most of the great possibilities, and a most original love-story is worked out against a dramatic background of frontier courage and savage cruelty. It is above all else a good *story*, swift, sustained, and well told. In all essential particulars it is uniform with "The Thrall of Leif the Lucky" and "The Ward of King Canute." $1.50

Ready in April

By WILLIAM DANA ORCUTT

Robert Cavelier

With 6 full-page illustrations in tint by Charlotte Weber

The picturesque figure of Robert Cavelier de la Salle is by no means a new one in fiction, as he has been introduced into several successful novels. In no case, however, had he been made the central figure—the hero—of a romance, until Mr. Orcutt recognized the unusual possibilities in the adventurous life and tragic death of the daring explorer. It is a beautiful and vivid romance, with sharply contrasted scenes in Old France and New France—the glittering, frivolous court at Versailles and the stern privation and struggle in the sorest wilderness. Mechanically the book is beautifully made, having illustrations of rare charm and a typographical dress of uncommon distinction. $1.50

Ready in March

A new book by the late Dr. THOMSON J. HUDSON

The Evolution of the Soul

With portrait and biographical sketch

A collection of essays and lectures found among the papers left by this remarkable man. The discussion of psychical subjects is handled in the same bold and original style which brought him his immense popularity when alive. *This edition rounds out the hundred thousandth of Dr. Hudson's works*, and every one of his admirers will want this new book. $1.20 *net*

Ready in March

A new book by JOHN T. McCUTCHEON

Bird Center Cartoons

Uniform with "Cartoons by McCutcheon" 9 x 12 inches Boards

These delightful drawings illustrating "social happenings at Bird Center" have seldom been equalled in good-humored delineation of country-town life, and in their newspaper form have attracted wide attention. The consecutive drawings contain the same characters, and a number of mild plots are worked out—a feature which gives the book a sustained interest. Also it contains a great deal of very humorous text (a delicious parody of the florid style of country journalism). It resembles the first book in the keen observation and gentle satire which makes Mr. McCutcheon's work of such universal appeal. $1.25 *net*

Published February 20

By IRENE GROSVENOR WHEELOCK

Birds of California

With 10 full-page and 78 text illustrations by Bruce Horsfall Flex. morocco

Prepared with a view to providing the student and the collector, as well as the general reader, with an adequate key to all the species usually met with in the State and adjoining regions. It is the result of an extensive and painstaking study of the species, principally in their own haunts, and is arranged with the purpose of supplying accurate and much-needed data. $2.50 *net*

Ready in March

A New Book by MARGARET W. MORLEY

Little Mitchell

THE STORY OF A MOUNTAIN SQUIRREL

With 24 illustrations by Bruce Horsfall

Few books of similar character have been more popular than Miss Morley's "Song of Life," "Bee People," etc. This engaging little volume is most entertaining for readers of almost any age, and is probably the only book in a distinctly popular style devoted to this subject. $1.25

Ready in May

A new book by SHERWIN CODY

The World's Greatest Orations

Uniform with "Short Stories" Essays, etc., 16mo

Another of Mr. Sherwin Cody's very practical and welcome compilations. He has developed a field of his own in the art of editing, and his previous volumes of the "World's Greatest Short Stories" and "Best English Essays" have become standard. $1.00 *net*

Ready in May

Sermonettes by Lamennais

Small 16mo Flexible cloth

A fourth volume in the "Helpful Thoughts Series," and distinguished by the same simple elegance of printing and binding. The Sermonettes are translated from the French, and have the qualities of inspiring and helpful philosophy that have been found in the other books of the series .80 cents *net*

A. C. McCLURG & CO., Publishers, Chicago

Religions of Authority

By AUGUSTE SABATIER

Late Dean of the Protestant Faculty of Theology in the University of Paris.

That the religion of the future will be neither of the Church nor of the Bible, but of the Spirit, is a thesis maintained here with as much dispassion as mastery.

"The final and true note of spiritual liberty."—*N. Y. Evening Post.*

Memoirs of Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps
$5.00 *net*. Postage, 35 cents

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety."—JOHN WHITE CHADWICK, in the *New York Times*, Saturday Review.

Important Biographies to Appear Shortly

John A. Andrew

By HENRY G. PEARSON

A BIOGRAPHY

The complete authoritative life of the famous war governor of Massachusetts is here presented. Mr. Pearson has had free access to all public and private records and letters. Two volumes, with Portraits; $5.00 *net*. Postage extra.

William H. Prescott

By ROLLO OGDEN

Mr. Ogden has combined in this volume in the "American Men of Letters Series" a most valuable critical study of Prescott's work, with a sympathetic portrayal of his charming personality. $1.10 *net*. Postage, 10 cents.

Napoleon

By COL. THEODORE A. DODGE

Vols. I. and II.

These volumes are a part of Colonel Dodge's "History of the Art of War," in which the work of four great leaders has already been treated. There will be two more volumes on Napoleon. Each volume, illustrated, $4.00 *net*. Postage extra.

Francis Parkman

By HENRY D. SEDGWICK

This volume in the "American Men of Letters Series" is largely made up of autobiographic materials. It portrays with true literary art the most heroic career in the annals of American letters. $1.10 *net*. Postage, 10 cents.

TWO TIMELY BOOKS

The Story of Japan ... $0.65
The Story of China ... $0.60
By R. VAN BERGEN

Apropos of the Russo-Japanese War, books upon the countries of the Far East involved in the conflict now raging possess particular interest for all readers. There are no better books on Japan and China than these. Written by a resident in these countries, they are profusely illustrated from photographs, and give in attractive form a good knowledge of past history and present conditions in the two Empires of the East. From these volumes can be gained an intelligent appreciation of the situation.

If your bookseller cannot supply them, they will be sent direct by the publishers to any address, postpaid, on receipt of price.

AMERICAN BOOK COMPANY

G. Stanley Hall
COMMEMORATIVE VOLUME
(American Journal of Psychology, July-Oct., 1903)

Published on the occasion of the 25th anniversary of President Hall's attainment of the Doctorate in Philosophy.

A collection of twenty-five contributions by American and European psychologists, including the following colleagues and former pupils: Beaunis, Kirschmann, Hyslop, Bentley, Washburn, Jastrow, A. Meyer, Patrick, Burnham, Leuba, Chamberlain, Edgell, Titchener, M. Meyer, Kuelpe, Ellis, Bergström, Pillsbury, Whipple, Cattell, Motora, Bolton, Dresslar, Sanford, Buchner; together with a Bibliography of Dr. Hall's published writings and a fine portrait.

"The twenty-five articles cover the whole field of psychological interest, from college football to the subconscious, and from musical æsthetics to retroactive amnesia."—The Nation.

Spring Educational Numbers

The usual Spring Educational Numbers of The Nation will be issued this year on March 31st and April 7th, and will reach the professors and teachers in all the leading Colleges and Academic Institutions in the country. Four thousand extra copies of each issue will be sent to persons interested in educational affairs in addition to those sent to regular subscribers, and as there will be different lists for each of the special issues, advertisements should be inserted in both of them in order to reach the entire list.

Copy for the first of these numbers should be received by Tuesday, March 29th, and for the second by April 5th.

THE SPRING BOOKS

THE NEW EDITION OF CHAMBERS'S CYCLOPÆDIA OF ENGLISH LITERATURE

Treats of 1216 writers not mentioned in any other work of a similar character in the English language. It contains 852 more pages than any work of its kind. We will be glad to send to anyone interested a full descriptive circular.

Complete in three Imperial Octavo volumes. Stoutly bound. $15.00 net, per set. Carriage extra.

JAPAN TO-DAY

By JAMES A. B. SCHERER, Ph.D. With frontispiece in colors and 27 illustrations from drawings by native artists. 12mo, decorated cloth, $1.50 net; postpaid $1.65.

The newest contribution to literature on modern Japan. The volume deals especially with the home-life and characteristics of the Japanese, illustrating many points by anecdotes.

FORWARD

By Miss LINA BOEGLI. With Portraits, Cloth, gilt top, $2.00 net; postpaid, $2.13.

An account of the adventures and experiences of a young Swiss woman who made a journey around the world alone and unassisted, and without other money than she was able to make on the way.

LONGMANS, GREEN, & CO.'S NEW BOOKS

The Evolution of Modern Liberty

By GEORGE L. SCHERGER, Ph.D., Professor of History, Armour Institute of Technology, with a Bibliography and an Index. Crown 8vo, 298 pages. Net $1.10. By mail $1.20.

The aim of this volume is to investigate the origin and development of the principles of modern liberty as contained in the Bills of Rights prefixed to the constitutions of the American states, and in the French Declaration of the Rights of Man and of the Citizen drawn up by the constituent assembly in 1789. The history of such ideas as those of the natural liberty and equality of men, the sovereignty of the people, the compact theory, the right of resistance to oppression, religious liberty and others, is traced from their origin to the end of the eighteenth century. The influence of objective conditions upon the inception of these principles is shown, as well as their influence upon political and social development.

TEXT-BOOKS OF PHYSICAL CHEMISTRY

Edited by Sir WILLIAM RAMSAY, K.C.B., F.R.S.

The Phase Rule and Its Applications

By ALEX. FINDLAY, M.A., Ph.D., D.Sc., Lecturer and Demonstrator in Chemistry, University of Birmingham. With 118 Figures in the Text, and an INTRODUCTION TO PHYSICAL CHEMISTRY by Sir WILLIAM RAMSAY, K.C.B., F.R.S.

Crown 8vo. $1.60. *Ready.*

*** *Sir William Ramsay's 'Introduction to Physical Chemistry' will also be issued separately.*

*** *The progress of Physical Chemistry is now so rapid, its domain is so extensive, and the number of journals devoted to its exposition is so great, that it has appeared desirable to issue a series of volumes, each of moderate compass, and each dealing with one branch of the subject. The rate of advance in various branches of the subject is not equal; while, for example, the basis of the science remains comparatively stationary (for methods of determining atomic and molecular weights, and the classification of compounds undergoes little modification), rapid progress is being made in other branches. Hence it has been thought proper to issue several short manuals, so that each individual one may be frequently brought up to date, independently of others. In this way, a statement of what is known on each subject will be made accessible to students and investigators. The subject has been divided as follows, among the authors mentioned:—*

AN INTRODUCTION TO PHYSICAL CHEMISTRY. Sir William Ramsay, K.C.B. F.R.S.—THE PHASE RULE. Alexander Findlay, D.Sc.—STOICHIOMETRY. Professor Sydney Young, D.Sc. F.R.S.—THE RELATION BETWEEN CHEMICAL CONSTITUTION AND PHYSICAL PROPERTIES. Samuel Smiles, D.Sc.—ELECTRO-CHEMISTRY. R. A. Lehfeldt, D.Sc. 2 vols.—SPECTROSCOPY. E. C. C. Baly, F.I.C.—THERMODYNAMICS. F. G. Donnan, M.A. Ph.D.—CHEMICAL DYNAMICS, AND REACTIONS. J. W. Mellor, D.Sc.

The order in which these parts will be issued is not that given; for some subjects are more easily treated of than others; but it is hoped that all the volumes will be ready for the press before December, 1904.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, MARCH 17, 1904.

The Week.

A delicate task has been laid upon the House committee which must investigate the "charges against members" in connection with the postal scandals. From the debates thus far, it is evident that the thing for which most Representatives are eager is a general whitewashing. The majority has steadily opposed anything like a complete overhauling of the Department, such as the minority urges. There is a singular tenderness, also, in dealing with the railway mail service, in which so many large corporations are interested. To irritate the railways just before a Presidential year would—from the point of view of a collector of campaign funds—be most unwise. And yet the Republican leaders should remember that the man who saved their bacon when charges were first published was not the Postmaster-General, who talked of "hot air" and who was inclined to pass lightly over the matter, but President Roosevelt, who courageously gave orders to drive the knife up to the hilt. As a result, people believe that, however rotten some of the departments may be, the President will do his utmost to hunt rascals out and make his Administration honest. Of course, an investigation dragging through the campaign would keep before voters the corruption which has developed under Republican rule; but, on the other hand, the Democrats may be trusted to make all possible capital out of any suppression or half-hearted search. The only safety now is an application of Strafford's vigorous policy of Thorough, which President Roosevelt declares he has adopted as his own.

According to Senator Dick and Gov. Herrick of Ohio, President Roosevelt has been guilty of blasphemy in bestowing patronage on the late Senator Hanna's enemy, Foraker. The two legatees of the Hanna machine have issued a bull of excommunication against Foraker and all his friends; have declared them heretics from the true faith, have called down upon their heads the curses of the Republican gods, and have forbidden all devout members of the party speaking with them, trading votes with them, or extending any aid or comfort, no matter how grave the peril, how extreme the pain of this band of outlaws. So horrible has been Senator Foraker's crime that we hesitate to soil our pages by mentioning it. He has not proposed to reduce the tariff, for a man can do that and yet hold the respect of orthodox Republicans; he has not plotted against Roosevelt's renomination, for some of the holiest fathers of the organization have been dubious about the validity of the Roosevelt dogma. But he has dared to oppose the Hanna machine. This is the unpardonable sin, which cuts a man off from the joys of this life and from salvation in the next.

The testimony in the Smoot case shows the highest authorities of the Mormon Church defiant of law, disloyal to their official pledges, and tricky and intriguing in their political activities. What most deeply outrages public sentiment is the perception that Mormonism still means polygamy; that it continues to stand for a system which means the degradation of woman and the ruin of civilization. Probably the hundreds of thousands of Christian women who petitioned the Senate to go behind Mr. Smoot's credentials, had no definite idea of the evidence that would be produced, but they were moved by a sure instinct. They were stirred not alone by impulsive self-defence, but by the perception that Mormonism and purity are contradictory terms, and that polygamy is an attempt to upset society and turn evolution backward. We cannot say that a case has yet been made out for Senator Smoot's expulsion. Legally, his position is stronger than it is morally. Still, the Senate is final judge of the qualifications of its own members. If it chooses, it may say that Mr. Smoot's associations and entanglements are such that it is not fitting for him to sit in the Senate of the United States.

Judge Alton B. Parker is not fortunate in his friends. As if the support of David Bennett Hill were not enough to alienate from him the independent vote, Edward Murphy, jr., of Troy now appears among the faithful. The two chief backers of Judge Parker in his own State are therefore Hill and the notorious Murphy. If the Parker boom can thrive in spite of such a blight, it must be a plant of hardy growth. Hill has been for twenty years the shining example of a political wrecker. He did his best to crush the Cleveland Democrats and drive them from the organization. There is no living American who more closely answers to Bagehot's description of a leader devoid of principle: he "regards politics as a game to be played first for himself and then for his party; he does not act contrary to his opinion, but he does not care to form a true opinion." A union of Murphy and Hill might almost be called a union of Herod and Pilate, for Murphy has been the chief of the Rensselaer County bandits who dragged Troy politics down to the level of highway robbery. His heelers hesitated at no crime, not even murder itself. Grover Cleveland was loved for the enemies he made; Judge Parker may come to be hated for the friends he has made.

It is a little odd to read of the Associated Press congratulations on having induced the Czar to remove the censorship in Russia, at the very moment that this same news-gathering association declines at home to disseminate information of the highest significance. It refused to send out the news of the organization of the "Philippine Independence Committee." Yet the names of the gentlemen composing it are of such weight and distinction that anything they are united in advocating acquires thereby news-value. If President Eliot makes an address on labor at Boston, or writes of the government of Bar Harbor, the fact is immediately put on the wires; but when he and eight other college presidents, together with eminent clergymen, authors, and publicists, have something to say about Philippine independence, it immediately becomes of no consequence, and the news is "killed." Why, if those men were on a committee simply to dig a ditch, the fact would be eagerly published by every real newspaper in the land! If the formation of a powerful "Philippine Independence Committee" is not news, then nothing is news. The upshot is to leave the Associated Press, by this refusal, in a kind of head-in-the-sand attitude, while the news gets circulated just the same.

"The old order changeth," quoted the Emporia *Gazette*, referring to E. W. Hoch, who was on Wednesday week nominated for Governor by the Republicans of Kansas. A year ago the Republican machine of that State, under the direction of Gov. Bailey and Cyrus Leland, a former National Committeeman, was running without a hint of creaking. Hoch, the proprietor of a small country newspaper published weekly, who in editorial sermons consistently demanded clean politics, set out to become State Printer at the time a vacancy in that office occurred. It suited the machine to appear to favor his candidacy, but, when the vote was taken in the Legislature, those who had promised to support Hoch turned to another man. It was, of course, no part of the machine's plan to share "pie" with a preacher who railed against the Topeka organization's methods. But when it was found by Gov. Bailey's opponents that his hold on the party was insecure, Hoch's earnest denunciations were recalled, and it was suggested that he would do admir-

ably as a leader of a revolt. In the "short-grass country" a movement founded on moral awakening spreads rapidly, if at all. A few months after the country editor received the first bundle of telegrams, as he was setting type for the week's edition of the Marion *Record*, he was nominated to succeed Gov. Bailey. The smashing of the machine proved to be no Herculean job, and in the next two years Kansas is likely to learn what a "strong, clean Governor," to adopt William Allen White's characterization, can make of his independence.

The course of the lynchers at Springfield, O., who on March 7 shot a negro murderer to death and on Tuesday set fire to the disreputable negro quarter, illustrates clearly what may happen in any community the instant the laws are defied. Bishops may approve, editors may palliate, and newspapers allege extenuating circumstances; but the fact remains that when the mob is once given its head, no one can tell to what excesses its bestial passions may carry it, or to what extremes its fury may drive it. This is entirely irrespective of local considerations. The burning of Springfield's negro quarter is on all-fours with the destruction of an Alabama town by its own citizens, who were bent on destroying a negro, together with the calaboose in which he was confined. Gov. Herrick of Ohio has notified the local authorities at Springfield that the Attorney-General will take charge of the prosecution of the lynchers if the local machinery of the law is not put into motion at once. He has also shown commendable firmness in ordering the troops to remain in Springfield as long as there is the slightest necessity for their presence or possibility of further trouble. As a result of the Governor's attitude, the County Prosecutor has awakened to the fact that he has a solemn duty to perform, and has promised to convene a grand jury without loss of time.

In a letter to a negro minister of Baltimore, Cardinal Gibbons has again shown himself a wise and far-seeing prelate. Writing of the "Jim-Crow" bills now before the Maryland Legislature, the Cardinal expresses his strong opposition to them and to the spirit actuating them, rightly pointing out that peace and harmony are impossible where such unjust discrimination prevails. To make a whole race suffer for the delinquencies of a few individuals he considers preposterous; and he adds that it is the duty of every member of a community to avoid any action calculated to create bad feeling and to embitter the lot of the less fortunate race. But this danger of racial hatreds, far deeper and more serious than any hitherto existing, is precisely what a cheap politician of the Vardaman, Tillman, and Gorman type does not think about. He is concerned only with his own personal advantage. Still others, like Congressman Hardwick of Georgia, calmly assume that our colored citizens, having been put in the inferior social, industrial, and political status he considers their due, will make no effort to better themselves. There is nothing further from the truth. The negro race is rising, and rising rapidly, and there is but one way that it can be kept down—by slavery or force of arms. Meanwhile, the words of Cardinal Gibbons, that peace and harmony cannot prevail where there is discrimination, constitute a solemn warning.

Two events have occurred lately that throw an interesting light on the immigration question. Signor Rossi of the Royal Emigration Department of Italy is in this country, and has written a long letter to the president of the Society for the Protection of Italian Immigrants. He says that, far from looking with favor on emigration, his Government makes a strong effort to prevent it. The heavy movement away from Italy in the past, he alleges, was chiefly encouraged by the transportation companies, whose only interest in the matter was, of course, the sale of steamship tickets. In line with this information are the recent arrivals in this country of large numbers of young and vigorous Russians, who are said to have left their native land very hurriedly to escape conscription. These emigrants tell interesting stories of how they managed to get by the Russian sentries in crossing the Prussian frontier. They seem to agree on the fact that their success was chiefly due to the efforts of transportation agents. According to one immigrant, the steamship runner who took their money not only gave them their tickets, but also made the deal with the sentries. These instances bring to mind the great success of American railroads in the past in stimulating and directing large movements of population from one region to another. No doubt the efforts of the transportation companies often lead to a purely artificial distribution of the excess population of the world, but natural law soon corrects mistakes of this sort.

The statement that the American Locomotive Company has bought a plant in Canada should be read in connection with Mr. Balfour's announcement in Parliament that no tax will be levied upon food. It will be recalled that Mr. Chamberlain was previously as emphatic in asserting that no duties would be placed on raw materials. But where does this leave the colonies? If Mr. Balfour is to be taken literally, there will be no tax on wheat, or flour, or corn, or other cereals; neither will meat nor animal products be made to pay duty. But a tax on breadstuffs, with colonial preference, was going to do such wonderful things for Australia! And if no duty is ever to be put on animal products, how is New Zealand going to obtain that preference which was to curtail the imports into the United Kingdom of Argentine mutton? Indeed, what is to prevent our sending just as much wheat and bacon to Great Britain as formerly? But, in that case, where would Canada's preference come in? As the bulk of what the colonies send the mother country is food or raw materials, it is hard to see what there is left in the fiscal reform for them. But note: Canada does some manufacturing, on which she may be able to obtain a preference. Yet in this connection it must be remembered that the American Locomotive Company is not the only American enterprise that has acquired a Canadian plant for export purposes.

On the railway issues, Sir Wilfrid Laurier lost his ablest Minister, Mr. Blair, and on the same issue he is likely to have serious adversity in the future. Last July the Government concluded an agreement with the Grand Trunk Railway for a transcontinental line north of all existing roads. The contract lapsed, partly through the attempt of the Grand Trunk to make the legal deposits in unauthorized securities—a measure that was the subject of just criticism. Now the Ministry has renewed the agreement on terms much more favorable to the company. In general, financial safeguards have been removed. By a simple transfer of rolling stock from the eastern to the western branch, the Grand Trunk may regain its $5,000,000 deposit; the time of construction is extended from December 1, 1908, to the same day, 1911, with strikes now reckoned as "unavoidable causes of delay"; the Government underwriting of the mountain branch is increased from $30,000 a mile to three-quarters of the actual cost. Evidently either the Grand Trunk was bargaining to its own hurt last summer, which nobody believes, or it is now bargaining very much at the expense of the Dominion. When the case is fully understood—and the Conservative press is not slack in the duty of interpretation—it is very likely that recent Liberal losses in bye-elections in Quebec and the Maritime Provinces will prove merely the precursors of more positive disaster.

Whatever may be the merits of municipal trading, there is a strong belief in Great Britain that the movement has progressed too rapidly. The manager of Lloyd's Bank in London spoke very emphatically on this subject at the recent annual meeting of that institution. He said that the debts of British mu-

nicipalities had been increasing by leaps and bounds during the last ten years, and now amounted to £350,000,000—half the national debt. The money had often been spent in municipal trading. The extravagance, he added, has been so great that the money market is now practically closed against the municipalities, it being impossible for them to borrow except at usurious rates. Indeed, it is asserted that, in order to raise cash, they have done a sort of banking business themselves, and have received money on deposit. The manager of Lloyd's Bank regretted the liberality of the bankers to the municipalities in the past, especially in view of the last-mentioned fact. It looks, indeed, as if the cities and towns of the United Kingdom had been doing about what the industrial enterprises in the United States were doing for some years after 1898—namely, converting floating capital into fixed capital altogether too fast. This fact has no doubt had a good deal to do with forcing British consols to their present low figure, just as the locking up of funds in this country caused the highest-priced securities to sell at a great reduction.

Short of defeat, a Parliamentary leader has rarely been so cavalierly handled as Mr. Balfour was on March 9 by his own supporters. Mr. Austen Chamberlain's advocacy of his father's fiscal scheme had given occasion for a motion of censure by the Liberals. In the course of the debate Mr. Balfour stood firmly on the principles of his Sheffield speech—declared himself opposed to all food taxes and devoted to retaliation. He was willing that Unionist members, in their private capacity, should believe in the whole Chamberlain policy, but he expected them to support the Government on the half-policy. To make the matter clear, a counter resolution was moved, which approved the Balfour plan. But soon it was evident that liberty of opinion on fiscal matters was permitted to all members of the party except the chief. The Chamberlainites declined absolutely to vote for a resolution declaring protection and food taxes to be no part of the Government plan, and the motion of confidence was hastily withdrawn. In the face of a refusal to vote confidence in the Government, the defeat of a motion of censure by a small majority was an empty triumph. The debate revealed very clearly the fact that, though a Balfour Ministry still rules, there are practically no Balfourites on the benches. Mr. Balfour has absolutely no secure majority. On several occasions lately a full attendance of Liberals and Nationalists would have turned out the Ministry. In fact, on Tuesday last, by a trick of Mr. Redmond's, it was actually beaten. Under these circumstances, a dissolution should logically follow the passing of the supply bills.

The Government bill suppressing all primary schools conducted by the religious orders of France was advanced to the committee stage on March 7. M. Combes reiterated his famous thesis—the incompatibility of Roman Catholic teaching with a free state—and estimated the cost of replacing the church schools at $13,600,000. This figure includes only buildings and equipment; an enormous amount in addition must be paid for salaries and maintenance. Creditable estimates set this sum at about $16,000,000 annually. It seems likely, then, that the Ministry will soon be in serious budgetary difficulties. M. Rouvier is already sorely taxed to arrange for current conversions of the national debt, and the covering of the deficit. Nobody can doubt, however, that M. Combes will carry his anti-clerical campaign to the bitter end. If he should be shipwrecked en route, as many are predicting, he would have the satisfaction of having held his tiller true. But he has precipitated a conflict which seemed by no means inevitable and must profoundly disturb the present social order of France.

Thirty-two years after the expulsion of the Jesuits from Germany, Bismarck's successor gives them anew the freedom of the Empire. That is the heavy price which Bülow pays for the support of the Centre. Without the 105 Clerical votes the Government's composite majority would disappear. Other reasons have helped to bring about this complete surrender. The protectorate of the Holy Sepulchre is undoubtedly one of the Kaiser's dearest ambitions. It would give a spiritual sanction to his large political and commercial pretensions in the Levant. Meanwhile, Premier Combes's uncompromising battle with the Church gives Germany every opportunity to substitute herself as the friend of the Vatican, as the ally both of the White and the Black Pope. Very likely these considerations of foreign policy have done much to reconcile old Bismarckians to what would otherwise be a most humiliating retreat. Besides the immediate handicap of being tied to the Clerical reaction, Germany faces a peculiarly ironical situation. She stands to-day precisely where she did before the *Kulturkampf*. Bismarck's great fight against the Church has gone for nothing, and is all to do over again. Canossa has been revisited.

The official announcement of the need of additional reinforcements for German Southwest Africa must have had a chilling effect upon the Reichstag on Monday. The demand for 800 cavalry and two mounted batteries of artillery shows that the situation is much worse than has been admitted in official quarters. Dr. Stuebel, the director of the Colonial Office, was forced to confess that there are still 5,000 Hereros in the field, and that they are well armed and well intrenched. This, together with the news, from private sources, of considerable sickness and mortality among the German reinforcements which have just arrived in the disputed territory, has given the public little cause for satisfaction with the situation, especially as the Governor of the colony has displayed marked incapacity for his place. The Social-Democrats have already served notice that they will oppose any further voting of men and supplies for Southwest Africa, and a lively debate is therefore in prospect. There is material enough for some very sharp attacks upon the Government. Col. Leutwein, the crazy governor of the Cameroons, who recently brought about a revolution because of a stolen lamp, is a shining mark, as well as Prince Arenberg, who has just been released from jail because of his alleged insanity when he committed the horrible crimes for which he was imprisoned.

M. Kokovseff, the head of the Russian Ministry of Finance, has evolved some queer ideas regarding the war expenditure. The cost of the war, he says, must not be compared with that of the South African conflict. It would be an exaggeration, he continues, to say that the war would entail a gross expenditure amounting to a quarter of the net cost of the Transvaal operations. That, of course, is pure guesswork, as no one has any real knowledge what the struggle in the East is going to cost. But, waiving that, what reason has M. Kokovseff for saying that the money spent by Russia will not be, as it was in the case of Great Britain, a dead loss? Most of it, he affirms, will return to the public chest. But will it? The cost of the transport of the troops will be paid to the State railways. True; but will it offset the loss to the State from the lessened volume of merchandise business? The Asiatic railroads owned by Russia are believed not to have been earning their running expenses, and charging up the transportation of troops to earnings is, after all, merely a ridiculous form of bookkeeping. It reminds one of the way the railroads of this country used to swell their earning statements by reckoning in the freights on their own construction materials. The present war simply means the destruction of capital which might have been devoted to productive ends, and it makes little difference, in the long run, whether this wealth is wiped out on domestic or on foreign soil. In this case a great deal of it will be used up in eastern Asia, in paying the troops and in the purchase of supplies. Large amounts will also go to Western Europe for supplies and services, and some will come to the United States.

THE MERGER DECISION.

The judgment of the Supreme Court in the Northern Securities suit, in so far as it is contained in Justice Harlan's opinion, is undoubtedly very sweeping. It clearly declares that the Sherman Act "is not limited to restraints of interstate and international trade or commerce that are unreasonable in their nature, but is directed against all direct restraints, reasonable or unreasonable, imposed by any combination, conspiracy, or monopoly upon such trade or commerce"; that "combinations, even among private manufacturers or dealers, whereby interstate or international commerce is restrained, are equally embraced by the Act," and it further sets forth that "the mere existence of such a combination and the power acquired by the holding company as trustee for the combination constitute a menace to, and restraint upon, that freedom of commerce which Congress intended to recognize and protect, and which the public is entitled to have protected." More particularly, Justice Harlan's opinion is that the Circuit Court's decision on the Northern Securities merger could not properly have been of smaller scope than it was.

That judgment was, that competition was annihilated when two previously competing railways were acquired by a common owner; that "every one is presumed to intend what is the necessary consequence of his own acts, when done wilfully and deliberately"; and, therefore, that acquisition of the Great Northern and Northern Pacific by a joint owner, which "destroyed every motive for competition" between two "natural competitors for business," was a restraint of trade within the meaning of the Act. This, it is true, was no new judicial reading of the Act of 1890; the principle had been even more cogently asserted by the Supreme Court itself in the "Trans-Missouri case" of 1897. The association so designated, formed for the purpose of fixing uniform rates on the railways in its membership, was dissolved by the court on the explicit ground that "the necessary effect of the agreement is to restrain trade or commerce, no matter what the intent was on the part of those who signed it."

The point naturally arises, in studying Justice Harlan's opinion, as to what limit can with assurance be set to the application of the law. The lawyer's criticism is, that so unrestricted a judgment may open up avenues of indefinite litigation, pending which a disturbing uncertainty might prevail in the community. But it is important to observe that Justice Harlan's opinion did not, strictly speaking, speak for the majority of the court. The case against the Securities Company was decided by a vote of 5 to 4; but Justice Brewer, though concurring with the majority in their judgment as to the case in court, dissents from some of the principles set forth by his colleague. This means that the court's majority opinion, in other cases involving the same principles, may quite possibly be regulated rather by Justice Brewer's reasoning than by Justice Harlan's. Justice Brewer limits with much conservatism the application of the Act. Explaining his dissent, he observes:

> "Instead of holding that the Anti-Trust Act included all contracts, reasonable or unreasonable, in restraint of interstate trade, the ruling should have been that the contracts there present were in themselves unreasonable restraints of interstate trade and, therefore, within the scope of the Act. Congress did not intend by that Act to reach and destroy those minor contracts in partial restraint of trade which the long course of decisions at common law had affirmed were reasonable and ought to be upheld. . . . Wherever a departure from common-law rules and definitions is claimed, the purpose to make the departure should be clearly shown."

Certainly, there is nothing alarming or unsettling in this construction of the law; it proceeds on the cautious lines to which the Attorney-General, in his Pittsburgh speech of October, 1902, drew attention, and in fact applies in its interpretation of existing law pretty much all the limitations suggested by the recent Foraker amendment.

While, therefore, by no means endorsing Justice White's intimation, in his minority opinion, that the power asserted "is repugnant to all the fundamental rights of life, liberty, and property, upon which all just government must rest," it is clear that Justice Brewer, in a case involving what was, in the court's mind, a reasonable contract, would stand with the present minority. In other words, there is ground for assuming that such cases as hereafter may come before the court, under the Act of 1890, will be judged on their individual merits rather than on any sweeping generalization.

Both Justice Harlan and Justice Brewer touched, in their opinions, on the argument which, in our own mind, has more than any other served to induce adverse conclusions regarding the Northern merger. The question where this control of competing properties by merger was to end, if not restrained by law, has been the vital question of the whole debate. To it the court reverts, in its final pronouncement, as the public has done many times in the interval. Justice Brewer sums up this phase of the situation clearly:

> "If the parties interested in these two railroads can, through the instrumentality of a holding corporation, place both under one control, then in like manner, as was conceded on the argument by one of the counsel appellants, could the control of all the railroad companies in the country be placed in a single corporation. . . . The holders of $200,000,000 of stock in the Northern Securities Company might organize another corporation to hold their stock in that company; and the new corporation holding the majority of the stock in the Northern Securities Company, and acting in obedience to the wishes of a majority of its stockholders, would control the action of the Securities Company, . . . and this process might be extended until a single corporation whose stock was owned by three or four parties would be in practical control of both roads, or (having before us the possibilities of combination) in control of the whole transportation of the country."

THE CAUSE OF POSTAL SCANDALS.

The man who persists in skating on thin ice will fall through. This is the elementary but valuable lesson which Congress has learned in the last few days. In besieging the Executive departments for favors, in using their influence to procure from "My dear Beavers" extra allowances for which there was no warrant in the business of local offices, Senators and Representatives have been meddling with matters that did not belong to them. Some of them must have known that the money for additional clerkships and higher rents was virtually stolen; but so long as Beavers and Machen would assume nominal responsibility, the legislators cheerfully met the demands for larger departmental appropriations and asked no questions. "Saving" doubtful districts is expensive, but most Congressman seem to prefer it to saving the income of the Government. There are, of course, many members who have joined the scramble simply because they could not resist the force of a bad example. Instead of letting a postmaster's application stand on its bare merits, they have wanted to show zeal for their constituents by overturning heaven and earth. They may not have intended to be dishonest; they have protested that they begged for nothing more than was due; but, none the less, they entered the broad and easy path that leads straight to corruption.

The root of the trouble strikes deeper than this Congress or the present condition of politics; it penetrates the very framework of our Constitution. Nominally, the Executive and the Legislature are independent—one a check upon the other. Actually, the filaments of the two departments interlace in a tangled plexus. The President has power to choose executive officers, though certain appointments must be confirmed by the Senate. Inevitably, the Senators have seized these latter offices, and, by a union offensive and defensive, have largely usurped executive authority. Only a day or two ago the dispatches announced that in two Ohio towns "Hanna" postmasters had been replaced by "Foraker" adherents, because the President discovered that these offices "belonged" to Senator Foraker. In short, the Senators look upon patronage and appropriations as property which they hold in fee simple, to be distributed among faithful retainers according to desert.

The greedy hand of the legislator has also grasped offices which are not subject to confirmation. A President can-

not know all of his appointees—he must rely upon the advice of people of the vicinage; and the men who get his ear with least difficulty are Senators and Representatives. Even were they disinclined to traffic in patronage, they could hardly help becoming office-brokers. When, as is usually the case, they are vitally interested in building up their small machines, they are sure to make office-hunting their chief occupation. Once they have a department well garrisoned with their vassals, they can and do exact concessions which are downright illegal. The hapless clerk or bureau chief sees that if he balks he becomes *persona non grata*, and a more complaisant official may succeed him. He is also aware that his stretching or actual breaking of the law, so far from weakening his hold upon Congress, strengthens it. His line of least resistance is that which the genial and accommodating Beavers followed. He good-naturedly yields on the point of allowances, and looks to the Senate and House for corresponding hospitality toward his demands for swollen appropriations or a higher salary for himself. Thus a new feudalism has grown up which was never contemplated by the fathers of the republic, but which has nevertheless been the logical fruit of the Constitution which they bequeathed us. Moreover, the Executive and the Legislature are knit together by reciprocity treaties that can never be broken; and, instead of restraining, they encourage each other in extravagance. Selfish human nature, which the devisers of our Constitution threw out of the door, has sneaked back through the window.

This unhappy tendency to obliterate the line between Legislative and Executive, to destroy salutary checks and balances, is reinforced by our system of having each Representative a resident of the State, and practically of the district, which elects him. John Morley may be returned for a constituency in Scotland or Wales, wherever there is a Liberal majority; but if Speaker Cannon's district happens to be either gerrymandered or swept by a Democratic tidal wave, he steps down and out. The result is that our national legislator is prone to take the parochial view of a county supervisor, to approach the tariff law as if it were an ordinance for a hundred yards of sewer. Foreign publicists have often censured this plan, by which we either rob ourselves of the services of our ablest men, or else restrict their horizon and narrow their energy to the oiling and feeding of a provincial machine. Bryce, in his 'American Commonwealth,' dwells at length on the fact that a Congressman is forced into "procuring, if he can, grants from the Federal Treasury for local purposes, and places for the relatives and friends of local wire-pullers who control the nominating conventions," and also into "nursing the constituency during the vacation." "No habit," adds Bryce, "could more effectually discourage noble ambition or check the growth of a class of accomplished statesmen." The freshest contribution to this discussion is in the late Henry Villard's account of a visit to Bismarck, extracted from his Memoirs for the March *Century*. The architect of German nationality declared that the restriction of residence "tended to develop champions of local instead of national interests," while in England and Germany "the élite of the nation" was drafted into the parliamentary ranks.

Our legislators, then, are partly victims of circumstance, each crushed by the wheels of his own little Juggernaut. But some of them are also men whose souls have atrophied in the course of long years of haggling in the marketplace. At first they have abhorred the vices of the "profane herd of vulgar and mechanical politicians"; then have assumed an attitude of cynical tolerance; and, finally, on the theory that inflexible virtue is political suicide, they have gone the way of all flesh. It is now evident that they themselves have laid the train for the explosion which has shaken Congress. The intriguing and peculation simply reached a point where concealment was no longer possible; and the men who have sacrificed great opportunities to trivial and sordid ends are, by a sudden stroke of fate, stripped of their pompous masks, and revealed to the world, feeble, chattering, quaking wretches. If the shock shall quicken a few consciences, shall warn our lawmakers and administrators that, consciously or unconsciously, they have been heading for the City of Destruction, the republic at least will suffer no harm.

UNKNOWN QUANTITIES.

"Cleveland is strong at the very points where strength is needed. No other man would make as good a fight in Illinois or Wisconsin. He would get more votes, we believe, in Indiana than Gorman or Olney would. Possibly Parker, as an unknown quantity, would do better here, though this is by no means sure."

These remarks of the Indianapolis *News* deserve attention for their apparent intimation that Parker might prove a strong candidate simply because he is unknown. Thousands of Democrats all over the country are lured on by this idea, and dozens of newspapers might be quoted as having expressed it in some form, though many of them put it forward as by no means well founded.

Far from being so, it has nothing to rest upon but a confusion between the business of nominating and that of electing Presidents. The notion that the voters of the country can be offered a choice in November between Roosevelt on one side and an "unknown quantity" on the other is a pure delusion. It is in nominating conventions, not in elections, that "unknown quantities" figure, and so it has been from the beginning. For Democrats to master this ought to be to them easier because recent history has been full of illustrations that it is disastrous to them. A candidate for nomination by a convention may derive strength from being unknown, because he is likely to have made but few enemies, or none at all, and consequently the different factions may find it easier to unite on him. The fact that Lincoln was unknown to the country at large made it less difficult to nominate him in 1860 than Seward. The fact that Hayes was little known outside of Ohio helped to give him the Republican nomination in 1876. But neither Lincoln nor Hayes was an unknown quantity when the election came off. By November the whole coutry knew exactly what sort of men they were voting for. One of the functions of a campaign is to act as a searchlight on the character and history of the candidates, and leave not a trait or event in shadow.

When Hancock was nominated by the Democrats in 1880 it was as a distinctly unknown quantity, so far as political matters were concerned. The theory of the nomination was that he would run well as a military man, and, his mind being a *tabula rasa* on all matters connected with government, it could not be objected to him that he had any political enemies. His was a name to conjure with, and he could be voted for, just as the Flag could be waved, by anybody. But it all turned out differently; the caricaturists got hold of him and made him thoroughly known. Long before November it was perfectly well understood what sort of quantity he was.

In taking up Bryan in 1896, the Democrats gave a glaring instance of the unknown-quantity fallacy. Cleveland they knew. He had twice got them the Presidency, but he had made a number of enemies, and they were in force in the convention. Bryan, an obscure local shouter, was unknown, and had none. So he was nominated with a hurrah. But he did not remain an unknown quantity. The process of making his acquaintance began among the voters as soon as the campaign opened, and by November the country had his measure.

For a party which desires to elect, it is important not to overlook what we have called the fallacy of the unknown quantity. When an unknown quantity has been nominated for the Presidency his incognito ceases, and his strength or weakness depends on what is found out about him, not on the number of points on which he has hitherto managed to keep silent. It is proverbially difficult in this country to nominate for high office conspicuous men of strong character and pronounced views, and it is proverbially easier to unite in a nominating convention on obscure men

without enemies, and who are "unknown quantities." But it is a compensation for this that when the election occurs neither candidate can be unknown. The more thoroughly the Democrats master this truth, the more chance they will have in the coming campaign. Delightful as it is to nominate, it is more essential to elect.

Judge Parker is undoubtedly an unknown quantity at present. On anything nearer to the questions before the country than the Constitutional guarantee of "due process of law," he has, we believe, never delivered himself. By holding his tongue he can remain unknown, but only until he is nominated. After that he must submit to the common fate. If he is a man of positive character, with decided views on the currency and the tariff and foreign relations, it will all come out. If, on the contrary, he is an entirely negative man, who has no conviction which cannot be modified to catch votes, that will come out, too. Depend upon it, we shall know all about him. Once nominated, what gave him his strength for the nomination will vanish, and he will be elected or defeated by what he really is.

THE OPERA SEASON.

In some respects the New York opera season of 1903-1904 will be remembered as the most interesting on record, and it is to be regretted that it should have been marred by shortcomings which were the more exasperating because they were unexpected. When Mr. Conried succeeded Mr. Grau, he recognized the fact that the one thing most needed at the Metropolitan Opera House was provision for more thorough rehearsing of the operas produced; he promised a speedy reform in this respect, but it is difficult to recall a season in which so many of the operas were apparently pitchforked upon the stage with no preparation at all. And shortcomings were particularly noticeable in the scenic department, which we had been told was to be specially improved.

It must be admitted that unforeseen difficulties confronted the new manager. He had intended to begin his rehearsals several weeks before the opening of the season; but the stage was being rebuilt, and was not ready in time, while the orchestra was away on a Western tour. Philadelphia presented another problem. Mr. Conried proposed to improve on Mr. Grau's plan by giving that city two or three weeks of nightly opera after the New York season; but the Philadelphians refused to look on that change as an improvement, so far as they were concerned, and threatened to have no opera at all unless they could get it once a week during the New York season. Thus was the manager thwarted in his attempt to save his Tuesdays for rehearsals; and since all his Thursdays were given over to "Parsifal," nothing was left but a few morning hours. As both Philadelphia and "Parsifal" will be with us again next season, it is obvious that the only salvation lies in carrying out the scheme of devoting five or six weeks to rehearsals before the opening date. That is the Bayreuth plan.

It is only fair to bear in mind that it was largely owing to circumstances beyond his control that Mr. Conried was prevented from making good some of his promises. He certainly did provide for most of the Wagner operas and some of the others new scenic outfits, which were a great improvement on what we have had before. If the setting and illuminating of these could have been properly rehearsed, they would have made a sensation instead of calling forth censure. "Parsifal" alone was done in a manner equalling and, in some respects, surpassing the Bayreuth standard, and the management reaped its financial reward in receipts exceeding $200,000 for that opera alone. Although the box-office results of the season have not been made public, there is reason to believe that no previous operatic year at the Metropolitan has yielded so large a profit. Extremes meet. For this happy result "Parsifal" was responsible in the first place, and, in the second place—Donizetti! The joint appearance of two such sterling artists as Mme. Sembrich and Signor Caruso led to a renaissance of old-fashioned Italian opera which caused the Donizetti works to draw crowded audiences at every performance.

In this fact lies the chief lesson of the season for the manager. Although everybody knows that Wagner is much more popular to-day than Donizetti (who has often, in fact, been pronounced dead), yet, with two or three exceptions, the Wagner operas have drawn smaller audiences than those of Donizetti. The reason is obvious. The recent Donizetti casts have never been excelled, perhaps never equalled, here, while the Wagner casts have usually been far inferior to those we have had in previous seasons. New Yorkers pay the highest prices in the world for opera tickets, and in return they demand, quite justly, that they should have the greatest singers in the world. Mr. Conried's chief mistake has been the failure to engage, at whatever price, certain singers who are great favorites here—Jean and Edouard de Reszke, Lillian Nordica, and Emma Eames. Mr. Grau used to say that his highest-priced singer, Jean de Reszke, was also the cheapest. He always filled the house. Without that tenor, Mr. Conried gave "Siegfried" once, to a moderate-sized audience, outside the cycle; with him, he could have given "Siegfried" six or eight times to crowded houses; and so with other operas—"Lohengrin," "Faust," "Romeo et Juliette," etc.

While Mr. Conried had been at one time an operatic manager abroad, he was, when appointed to his present place, unfamiliar with the taste and demands of the New York public. He had a vague idea that Europe was full of young and talented singers who would be promptly accepted here in place of the great stars he refused to engage. He is absurdly mistaken in this matter; there are painfully few good singers in Europe, and some that are admired there make little impression here, as Mr. Conried has had occasion to notice in the case of several of his importations. As regards French opera, the situation seems hopeless; there are no satisfactory tenors, and Mme. Calvé and M. Plançon appear to be the only first-class artists to be had from Paris, yet it seems doubtful if they will be here next year! But if there are few French singers, there are Americans and an Australian and Poles—Mmes. Eames, Nordica, Melba, MM. Jean and Edouard de Reszke—who sing French operas admirably. Why not make sure of these at once for next season?

Mr. Conried harbors antiquated ideas regarding "stars" and "ensemble." He apparently needs to be told that an ensemble of mediocrities is not desired or tolerated by opera-goers who pay $5 for a seat. What the want is *an ensemble of stars*, after the fashion of Mr. Grau. That is what fills the house and, notwithstanding the expense, yields a good profit. For the Italian operas alone have we had, this season, the best available singers. The result was that twelve Italian operas received fifty-four performances, whereas the eleven German operas in the repertory had only thirty-eight, and the three French operas had only ten performances. That tells the whole story; and if Mr. Conried cannot read the lesson as he runs, he is a poor business man. Instead of engaging the singers his patrons want, he is trying to "discipline" them—a very dangerous process. It is true that these artists get much less in Europe than they do at our opera-house; but they are not, as Mr. Conried fancies, dependent upon him. Other American managers are shrewd enough to know their value; hence we have Fritzi Scheff in an opera company of her own, and Calvé and Schumann-Heink preparing to follow her example; we have Nordica, Melba, Bispham, in the concert hall, with Gadski and Campanari ready to follow them. Where is this to end? Operatic affairs have reached a crisis, and this is the time for the subscribers to make known their wishes.

MR. CHOATE'S TALK TO WORKINGMEN.

LONDON, March 1, 1904.

Mr. Choate's talk to workingmen on the

subject of Benjamin Franklin well deserves notice. It was delivered on February 20 to the students of the Workingmen's College, an institution founded by Frederick Maurice some fifty years ago, and of which it is my hope on some future occasion to write something further for the readers of the *Nation;* but at this moment my wish is to dwell upon certain conclusions suggested to one at least of his audience by Mr. Choate's admirable and charming address, which, with all its graciousness and its humor, was fitted to convey to Englishmen of all classes lessons of immense value at a time when every benevolent and public-spirited person has become so occupied with the social side of life as hardly to appreciate the moral merit of that manly individualism of which Franklin will always remain a typical example. If, let me add, I say little of Mr. Choate's genial urbanity, of the charm of his humor, of the perfect lucidity of his exposition, it is because the admirable qualities which have won for him the confidence of every Englishman who has the pleasure of his acquaintance are thoroughly known to his hundreds of friends and admirers at New York. My aim is, as I have said, simply to state, as the comparatively short reports of the English newspapers certainly do not, some few of the many ideas which Mr. Choate's account of Franklin excited in the minds of his audience.

First. Franklin, whose name and teaching are now little known in England, is well entitled to all the respect and admiration which he received from liberal-minded Englishmen in the earlier part of the nineteenth century. We must never forget the dictum, due, I think, originally to Sir Leslie Stephen, that in England the eighteenth century lasted till 1832; and Franklin was admired in England at what we may call the era of the Reform Act, because he was the incarnation of the wisdom and of the goodness of the eighteenth century. A stupid habit, fostered and encouraged by writers such as Carlyle, has been to talk of that age as if it were in a special sense marked by low moral tone, by false sentimentality, by lack of real earnestness. That the men of the eighteenth century had their faults, no competent critic can deny; that they had inherited a good number of speculative errors and practical abuses, is past a doubt; but the enlightenment that was perhaps overestimated, dispelled these errors, and the cosmopolitan philanthropy which is now far too little valued, abolished these abuses.

Franklin, at any rate, and many of his associates, were marked by a kind of truthfulness and sense of reality of which modern England possesses none too much. The leading feature of Franklin's character was honesty and respect for facts. Grant that his ideals, though never low, were in a sense prosaic; but let it be remembered that he struggled more earnestly than does one man in ten thousand to live up to his ideals. Industry, temperance, self-restraint, and honesty may be called common virtues, since they are needed by all men; but are assuredly, in fact, when consistently practised, excessively rare. What no one can doubt to be rare is, that a man should labor at the acquisition of these so-called common virtues with the same energy and method with which many men labor at the acquisition of wealth or of professional success.

Let us, again, assume, for the sake of argument, that the moralists of the eighteenth century, in their religious conceptions, showed a want of imagination and of fervor, and underestimated the value of faith and enthusiasm. Even if this be so, the justification and excuse lies ready to hand, that they underrated religious emotion because it had been closely allied with the fanaticism, intolerance, and persecution which had tortured the men of the sixteenth and seventeenth centuries, and were therefore to the thinkers of the eighteenth century the objects of special detestation. But if we look at Franklin, we may pause a good while before we condemn the religious attitude of this enlightened philosopher and his contemporaries. His somewhat frigid Deism was, as Mr. Choate showed, a real faith—that is, a creed which actually influenced his conduct. It meant, indeed, to Englishmen on either side the Atlantic a good deal more than their descendants are apt to suppose. The God of Nature, the benevolent Creator, whose equal and impartial Providence ruled the universe and showered blessings upon all men, irrespective of their creeds, was an object of far more rational adoration than the Deity whom Catholics and Protestants, Calvinists and Jesuits, pictured to themselves as taking a side in bitter theological controversies, and countenancing the cruelties and the persecutions by which fanatics of all kinds believed they could serve Heaven while tormenting their brethermen. It was better to worship Franklin's God of Nature than the God either of Loyola or of Calvin. Toleration, which is now accepted as a rule of common sense, was with Franklin, as with the other leaders of the eighteenth century, a true form of religious enthusiasm and of worship.

Secondly, Franklin will never receive from modern Englishmen anything like his due meed of praise. The force of the reaction against the reasonableness of the eighteenth century which set in in the earlier years of the nineteenth, has not as yet spent its full force. The state of opinion in England is a strange one. We condemn and despise that lack of enthusiasm and of fervor in which we believe men like Franklin were deficient; yet, while we talk as if we had left the eighteenth century far behind us, we are unconsciously reverting to a religious or non-religious attitude very like the attitude of the more enlightened among our grandfathers. The Evangelicals or the Methodists who aroused a religious revival, who rekindled religious emotion, had a right, if they chose, to blame the cold morality of Franklin, or Bentham, or Paley. But what right have we Englishmen or Americans of to-day to repeat the censures of religious revivalists? Do we suppose that Wesley, or Whitefield, or Simeon, could they return to the world, would deem our morality a whit less cold than the morality of the men of the eighteenth century? Whitefield, with whom Franklin was intimate, would, we suspect, find the men and women of to-day far less accessible to religious emotions than were the congregations among whom he kindled passionate fervor.

The reason why many of us cannot sympathize with Franklin is one which, even in our own hearts, we hardly dare to avow. His idea of a man's duty was that one should form a reasonable or even a prosaic view of virtue, and then try heart and soul to live up to it. Our conception of human duty is, that men should form a poetical or imaginative ideal of virtue, and then tacitly admit the impossibility of living up to our ideals. We value, as Franklin possibly did not, high aspirations. Franklin undervalued emotional morality, but he rated beyond everything else correspondence between a man's moral principles and his conduct. The same difference of moral judgment takes sometimes another shape. All Franklin's sympathies were given to persons who, even if they took Poor Richard's maxims as their guide, actually practised the humble virtues which these maxims enjoin. Our sympathy is nowadays given only to some man or woman whom we deem "interesting," but interest is aroused by inconsistency and inequality of character. Hence the modern biographies which are read with avidity are the lives of heroes or heroines whose high aspirations are far more remarkable than the excellence of their conduct.

Thirdly. The true lesson of Franklin's career is that virtue may be fostered and success in life be achieved by means of energy and self-help. This is the moral to which Mr. Choate's impressive address again and again came round. Surely, it is a lesson which modern Englishmen generally, and especially English workingmen, need to learn, and which is rarely pressed upon their attention. Just as our sense of social duty has risen, our sense of the individual duty of self-help has declined. Neither in church nor in chapel, neither in Parliament nor on the platform, are men now taught that their moral welfare and social prosperity depend on their own conduct. One who described himself as a workingman recently poured out to the London *Times* his bitter complaint. His grievance was that, while "the workmen of England are without doubt the finest and most intelligent men in the world," yet "the British Government has not succeeded in placing [them] in anything like the splendid position in which the American Government has succeeded in placing its workingmen." It is worth while to weigh well the assumptions which this language implies. Whoever does so will come to understand some singular features of public life in England at the beginning of the twentieth century. One conclusion, at least, will be easily reached by an impartial thinker. If many wage-earners share the ideas of this "workingman," from whose letter I have quoted a few words, it is high time that English workmen and also English statesmen should lay again to heart Poor Richard's maxims, and should turn to the teaching of Benjamin Franklin.

AN OBSERVER.

MADAME DE POMPADOUR.

PARIS, February 22, 1904.

M. Pierre de Nolhac, the present keeper of the famous palace of Versailles, is doing an excellent work in restoring the favorite habitation of the French Kings and the centre of their brilliant and numerous court. When the Revolution dragged Louis XVI. from Versailles to Paris, the palace was forever abandoned. Napoleon, in all his glory, would never inhabit it, and the Bourbons, after their return, neglected it

and looked on it with painful recollections of the evil days of the Revolution. Louis-Philippe, who kept his court at the Tuileries, resolved to make of the Versailles of the Kings a national palace; he dedicated it "à toutes les gloires de la France." His architects found the palace inhabited by more than a hundred families, who, under various pretexts, had installed themselves in every corner of it, and had completely changed the character of all the apartments. It was no easy task to turn out all these parasites. Under the direction of Louis-Philippe the palace became a sort of historical museum: souvenirs of old France were mixed up with souvenirs of the Napoleonic period; a most admirable collection of pictures covered the walls; the ancient panels were too often replaced by new ones, more convenient for hanging the additional pictures; Horace Vernet covered whole walls with his enormous battle-pictures. Under the Second Empire, Napoleon III. continued to fill Versailles in the same spirit.

It was only when M. Pierre de Nolhac became the keeper of Versailles that a new plan of restoration was formed. M. de Nolhac has done his best to show us Versailles, or at least a great part of it, as it was under the reigns of the Kings. He has found the old panels and replaced them, he has hung the portraits where they were placed in their time, he has given us a vivid representation of the ancient court. He has published some very excellent and beautiful works devoted to the last occupants of Versailles. They have had the success they deserve. I will only refer to-day to a study, which he has just made, of Madame de Pompadour, and which is probably only the preface to a compendious volume.

"It is difficult," says M. de Nolhac, "to defend the memory of Madame de Pompadour. She has had against her, at the same time, the writers of a party who could not forgive her the suppression of the order of the Jesuits, and all the Revolutionary writers. . . . The quiet study of facts and of men is daily abating these exaggerations." Madame de Pompadour's extraction was the subject of much criticism; she was thought, by the aristocratic society in which she lived at the time she was in favor, to be unworthy of it; her family was much despised and abused; she herself never forgot her origin, as M. de Nolhac has found proof in some inedited documents—sixty-five letters of François Poisson to M. de Vandières, the letters of Le Normant de Tournehem to M. Poisson, her father, who was a Paris butcher. His daughter married a financier, Lenormand d'Etioles. She was very handsome, and had received the most brilliant education; she was introduced into the court circle by the Duc de Richelieu. After the death of the Duchess of Châteauroux she became the favorite of Louis XV., who named her Marchioness de Pompadour. She at once took the measure of her royal lover, and aspired to be "not only a mistress for the King's amusement, but a personage of state. She followed the King when he went to the army; she mixed in all public affairs; generals, secretaries of state, ambassadors, were obliged to reckon with her. She became openly for about fifteen years a sort of prime minister."

Madame de Pompadour was thus a power in Europe. Frederick the Great imprudently offended her by his sarcasms against "petticoat government." Maria Theresa, the virtuous Empress, who was regarded as a model mother, went so far, in order to separate France from Prussia and to obtain the French alliance, as to write to Madame de Pompadour, and to call her "chère amie" and "belle cousine." Cardinal de Bernis, the favorite of Madame de Pompadour, whom she made Minister of Foreign Affairs, signed with Austria the Treaty of Versailles, in which France engaged to help the cause of Maria Theresa with an army of eighty thousand men. Madame de Pompadour is in reality an historical character. She seduced in France not only the court, but the artists, the men of letters, especially Voltaire, by a certain kind of greatness, by her generosity, her philosophical ideality. M. de Nolhac does not deal with the historical events in which Madame de Pompadour played such an important part; he enters more into her private life, and particularly into her relations with her own family.

She procured for the husband whom she had left, M. d'Etioles, a very large income, which allowed him to lead the life of the great financiers of the time in the Hôtel Conti. He was a farmer-general, and succeeded, in this important office, his uncle, M. de Tournehem, who had himself been made Director of the King's Palaces. All the members of her own family became her protégés. "There was no distant cousin who could not look to her for assistance when it came to establishing his children. A trace is found of her liberality in the text of her will, in the list of the pensions which she paid." Her father was intoxicated by the honors paid to her, and often became importunate. The same may be said of her brother. Poisson wished his son to be made Superintendent of the King's Palaces; she writes to him: "In order to be happy, you should never desire impossible things; I am sure there never will be a Superintendent, either of finances or of buildings; so don't let us think about it. This does not prevent my being sure of securing a good marriage for my brother."

Madame de Pompadour wished, however, to prepare her brother for the functions of a sort of Director of Fine Arts by a journey to Italy. She herself chose three persons to accompany him in it—Cochin, the engraver, who was one of her favorite artists; the architect Soufflot, who built the Panthéon of Paris; and the Abbé Le Blanc, a great friend of the pastellist La Tour, the art critic of the official paper, the *Mercure*. M. de Vandières could not have had better companions. "On this journey," wrote his sister to him, "depends all your reputation and your fortune." Vandières was twenty-four years old; the Marquise gave him instructions, in a letter which he received at Lyons on December 18, 1749:

"You were right, *frérot*, not to bid me good-bye; for, despite the utility of this journey for you and the wishes I have always entertained for your good, I should have had great pain in leaving you. . . . What I recommend to you above everything is the greatest politeness, the greatest discretion. Get it well into your head that, being made for the world and for society, you must be amiable to everybody, for, if one took thought only of the people he esteemed, he would be detested by nearly all human kind. Do not forget the conversations which we have had, and do not believe that, because I am young, I cannot give good advice. I have seen so many things during the four years and a half that I have been here, that I know more than a woman forty years old."

Vandières and his companions left Paris in December, 1749, and did not return till July, 1751. Madame de Pompadour's brother travelled as a *grand seigneur*, at the King's expense. He was under orders to keep everywhere open table; he was received by the King's ministers, and presented privately to all the sovereign princes. He seems to have been a very agreeable young man. The Duke de Nivernois at Rome praised him much, as Madame de Pompadour wrote to him. Well pleased also were M. de la Chétardie at Turin, the Marquis de l'Hôpital at Naples. During Vandières's absence the position of his father was much bettered. On his return he found his parent established on a fine estate at Marigny. There the young traveller was received in triumph, complimented by the curate and the inhabitants; the girls and the boys, costumed as shepherds and shepherdesses, accompanied him with songs; at the château they offered their lord the wine of honor. At their head was the *bailli*, who paid him a compliment. In the evenings, there were great displays of fireworks in the park. "Under what name," wrote Madame de Pompadour to her father, "do you wish your estate to be made a marquisate?" This request made him hesitate; he only desired the marquisate for his son, and wrote to him: "M. de Gesvres wishes you to assume the name of Marquis of Marigny; take it. As for myself, my name is François Poisson."

A new château was built at Marigny, under the direction of the great architect Gabriel. Poisson was growing to be a personage. His daughter was incessant in her attentions to him. Another of her affections was the daughter she had during her marriage, Alexandrine d'Etioles; she had her educated in the Convent of the Assumption, the best convent in Paris for the daughters of the great families. She was trying to find a husband for her in the most aristocratic circles when Alexandrine died after a short malady. Vandières became Marquis de Marigny by letters-patent on the 14th of September, 1754; he occupied the post which, under the title of Superintendent, had been occupied by the greatest ministers of Louis XIV. He had learned much in Italy, and showed great competence in all matters concerning his department.

If Madame de Pompadour deserves many reproaches, it must be said, to her credit, that she was a very good daughter and sister; she was also a great patron of art, and her influence was felt in the artistic movement of her time. She was more competent to choose painters, sculptors, and architects than generals and ambassadors.

Correspondence.

THE ABOLITION OF WAR.

To the Editor of The Nation:

Sir: The present Russo-Japanese war, occurring so soon after the establishment of the Hague tribunal of international arbitration at the suggestion of the White Czar, is absorbing the interest of man-

kind, and raises more sharply than ever the question of the abolition of war. War is contrary to the Christian religion and morality. All admit this, and argument is superfluous. The duel, private war, and civil war have already been largely abolished in most civilized countries. It remains only to abolish international war among the few great Powers, and the rest will follow.

Every great reform must start with a thought coupled with a feeling. The principal thought and feeling in this reform ought to be that war is a system of wholesale murder and suicide, and that the man who favors war for its own sake is a murderer and destroyer, a criminal at heart. Comparatively few men are deliberately of this nature in time of peace, and fewer still would care to acknowledge it. But in time of war all men, and even many women, are to a greater or less extent infected by the war spirit, the blood lust, and the love of destruction.

The true weapon against war is moral. But few men are willing or able to oppose current public opinion ethically. The vast majority of mankind are too selfish to be influenced by purely moral considerations. They refrain from lying, stealing, killing, and destroying, not because these things are wrong, but because it "does not pay" to commit these crimes—or, at any rate, to get found out. In other words, it is not for their selfish interest to be criminal. Principle is pure gold, expediency is pinchbeck or brass. But so powerful is the influence of expediency and selfishness in human affairs that, although they must be rigorously and uncompromisingly treated as inferior motives for moral reform, yet they must be utilized in order to obtain practical results. Mankind must make a practical working choice between civilization and war, building-up and progress on the one hand, tearing down and destruction on the other; the sacredness of human life in all its integrities on the right, hell drenched with human blood on the left. There can be no question of the ultimate result, and the practical progress of humanity and civilization is so rapid nowadays that the abolition of war is a foregone conclusion, and probably far nearer than seems possible to "practical" men who are not practical. We should bend our best efforts to hasten the dawn of universal peace.

War is essentially unscientific and unpractical. From the standpoint of evolution it is a system for the wholesale destruction of the fittest. The beneficent energies of science and art are employed to build up and improve two countries; then their evil powers are employed to injure and destroy these same countries. This is inconsistent. Two countries commit the crime of war. Gigantic fines are imposed on both victor and vanquished, and inexorably collected. Witness the decline of British consols since the Boer war, and the present decline in Russian and Japanese bonds—measures of the poverty resulting from these fines. Witness the stagnation of our own business—the fine imposed and collected from mere spectators. Does war "pay"? Is there more money in crutches than in boots, in shrouds than in shirts?

War survives only because it is regarded as a practical necessity in international affairs; yet within the limits of any one country peace is regarded as a practical necessity. Another inconsistency. Manifestly, the problem is only to enlarge the sphere of peace to international and finally world dimensions. What idea and feeling must we cultivate? Simply that humanity is a higher sentiment than patriotism, and that the affairs of the whole world are of more practical importance than the affairs of any one country. There are but half-a-dozen first-class Powers in the world. The combination of two or three at most could practically dictate peace to the civilized world. The United States of America should be the leader of this combination. The beginning of the details seems difficult, but we have built transcontinental railroads and are about to dig an interoceanic canal; the same practical conviction, careful survey, and skilful engineering and perseverance will achieve the infinitely greater feat of the abolition of war. Populism is an adverse factor, but that can be overcome.

With the downfall of war, the bottom will drop out of the whole structure of selfishness (as distinguished from legitimate self-interest). War brutalizes and degrades, in spite of its nobler and better side. Upon the whole it fosters the spirit of hostility, brutality, hardness, coldness, calculation, and general selfishness. It tends to let loose blood-lust, land-lust, gold-lust, sex-lust, drink-lust, and all the others. This is not ignoring the moral benefits of war, but is the just striking of the balance.

Many will ask what is to become of manhood if war is abolished. The answer to this question is easy. What *has* become of our American manhood in the generations of peace intervening between our few wars? With no more war, we shall have the strength and courage of men rather than the brutality and ferocity of human wild beasts, and in addition the gentler virtues of humanity. It is exercise, not strain, which develops and strengthens. Suppose all the wars in the world could be concentrated into a single delimited permanent war-zone—an arrangement which should be more satisfactory than the present one, both to the lovers of peace and the lovers of war. That war-zone would contract as time went on. Women and children and some men would flee into the peace-zone, and not so many would go the other way. The remaining population would dwindle away by decimation, loss of property, poverty and disease, and the decline of reproduction. If this war-zone should appear as a red spot to observers from neighboring planets, they would soon be discussing its disappearance in amazement.

ROBERT SEDGWICK MINOT.

BOSTON, March 8, 1904.

A PITFALL OF ATHLETICS.

TO THE EDITOR OF THE NATION:

SIR: The letter of Professor MacDonald in the current number of the *Nation* on "The Athletic Imbroglio at Brown" prompts me to say a few words in defence of what I understand to be the position of the recent members of the Committee on Athletics at Brown. My warrant for expressing an opinion concerning the rules against professionalism in college athletics is that I have watched the course of such athletics with considerable interest for a generation, and that I was for four years, 1897-1901, a member of the Committee on Athletics at Harvard.

During my service on the Harvard committee I came to the conviction, which nothing occurring since has weakened, that the rules against professionalism were a potent cause of demoralization, and ought to be amended or abolished. For example, there was, and I believe there still is, a rule declaring any person to be a professional athlete who had ever engaged in any athletic contest for money, or had ever received money for teaching any branch of athletics. There was no age limit, no time limit, no money limit. I well remember the feeling of dismay which overwhelmed a boy of ten or twelve years when he discovered that to engage in a footrace for a five-cent prize made him a professional athlete for life, according to the Harvard rule. Ridiculous, childish misapprehension! Of course, no one would think of holding to the letter of the law in such a case. Precisely so; but at just what age, with just how large a prize, would the law come into force? There is no possible answer to this question. Every individual, whether athlete or member of the committee governing athletics, must interpret the law, not literally—that is impossible—but according to his judgment of what is reasonable.

I suppose there never was a committee on athletics having this rule that did not wink at some violations of it. What, then, of the athlete himself? Four or five years ago, let us say, he taught boys to swim at a summer camp and got a few dollars of pay for this entirely respectable piece of work. Shall he, then, renounce all participation in college athletics, or shall he say to himself, "I don't think that ought to count; I will say nothing about it"? Judging from analogous cases which I have noticed, I believe that he will almost invariably take the latter course. Is it clear that he should not do so, the rule in question being, as every one acknowledges, not to be taken with absolute literalness? Very well; he goes into a college team and becomes important; somebody looks up his "record"; explanations are called for. Then begins the process of proving by affidavits or other solemn statements from the athlete, or perhaps from the head of the school in which he did the work in question, that, although A. B. did receive pay as a teacher in the summer school, and did teach swimming as a part of his regular duty in that school, yet the said A. B. was not paid for teaching swimming. And there you are at last, thoroughly sophisticated, literally demoralized. This is the sort of thing that an absurdly strict rule has occasionally brought to pass at Harvard. I have no doubt it has worked in the same way at Brown.

What, then, can be done? We must have some rules. I should like to see the following plan tried:

Have no man on a 'varsity team during the first year of his residence.

Have on the 'varsity teams only *regular undergraduates* in good standing.

Leave the matter of summer baseball and other kindred questions entirely to the good sense and good taste of the athletic authorities of each institution.

Very truly yours, EDWIN H. HALL.

30 LANGDON ST., CAMBRIDGE, MA
March 13, 1904.

ACADEMIC SALARIES.

To the Editor of The Nation:

Sir: Your correspondent "A. Grocer" (No. 2016) may certainly pride himself on having exhibited the commercial view of academic life in all its naked atrocity. I wonder, however, whether on reflection he is quite satisfied with the results. Does he seriously think that the "sour pedants" whom "great" universities condemn to lingering starvation on $1,000 a year are the stuff whereof "good instructors" are made? Does he contemplate with equanimity the prospect of leaving the higher education of a great country, the advancement of its knowledge, the appreciation of its literature, in the hands of an undistinguished multitude of such soured pedants? Perhaps he would reply that for first-rate men he was willing to pay more. But has he ever considered what attractions the prospect of being turned into "sour pedants" offers to young men of ability and ambition? However attractive the pursuit of learning might intrinsically have seemed to them, will they not be forced to put aside the temptation of a career which condemns them to lifelong penury? And if his commercially alert college president cannot *recruit* first-rate men for the profession, whence will he get them for the higher posts?

The difficulty is a real one, not only in America. We feel it even in Oxford, where the ablest men are manifesting a growing inclination to prefer to academic seclusion the more stirring life and greater prizes of the professions and the Civil Service, so that it is often not quite easy to fill academic positions worthily. And yet we offer far better terms to beginners than are to be had in any American institution. They usually receive about $2,000 to start with, an honorable position as members of a self-governing corporation, and practical fixity of tenure. And we are crafty enough also to select our tutors while they are yet young and fairly innocent and still deem the academic the ideal life!

In short, even from the most commercial standpoint of the most unacademic board of trustees, it seems a mistake to put all the money into bricks and mortar. Libraries and laboratories alone will not advance learning or evolve discovery: Ἄνδρες οὐ τείχη πόλις. Real ability is rare, and unless its highest forms can be enrolled in the army of science, the soured pedants and commonplace dullards will conduce, not to the advancement of learning, but to its contempt. F. C. S. Schiller.

Oxford, March 1, 1904.

A PROTEST.

To the Editor of The Nation:

Sir: I have received a flamboyant advertisement of a work in twenty volumes which calls itself "A Definitive, Authoritative and Inclusive Narrative History of North America,' edited by Guy Carleton Lee and published by George Barrie & Sons of Philadelphia. Some publishers allow themselves such latitude in the praising of their wares that, although the present advertisement is, I think, the most pretentious I have ever seen, carries self-laudation almost beyond the bounds of rhetoric, and commends the editor in most fulsome terms, I do not intend to comment on these things. It is a more serious matter that, in the heading, below the extraordinary title or legend I have quoted, occur the words, "Based on a Plan suggested by the American Historical Association." Every one who has attended the meetings of the American Historical Association during recent years knows well that it has never suggested or approved any plan for any coöperative history of America. The nearest approach to such action was when, at the Washington meeting of 1901, "the council reported that, at a meeting held in New York, November 29, the proposition of a coöperative history of America was carefully considered, and, in view of the difficulties involved, the council had voted that it would not be expedient for the American Historical Association to take part in forming or carrying out a plan for the composition or publication of a co-operative history of the United States. On motion, the action of the council was unanimously approved by the Association" (Proceedings, Annual Report for 1901, p. 37). The project then submitted and rejected was not this of Mr. Lee's. Yet the circular before me, after speaking of the plan of the proposed work, proceeds to say:

"The American Historical Association some time ago considered the question and determined on a plan for a history that should be: (1) coöperative; (2) under the direction of an editor-in-chief; (3) that the publication be made in small volumes, each complete in itself. The plan of the Association has been improved upon in that," etc.

The statement here made is completely and notoriously false. It is likely that the writers of the circular have shrewdly chosen language which exempts them from legal consequences. But the intention to deceive the public into the belief that the American Historical Association is in some manner connected with the enterprise is none the less manifest, and none the less contemptible.—Respectfully yours,

J. Franklin Jameson.

University of Chicago, March 11, 1904

THE PAPAL TIARA.

To the Editor of The Nation:

Sir: The *Nation* of January 14 has just come under my notice. Apropos of the review of Father Chandlery's book there is a statement which, doubtless, for the sake of accuracy, you will wish to correct. The discriminating reader will have corrected it for himself.

The reviewer says (p. 37, col. 2): "The author surely cannot be ignorant that the tiara first came into existence in the fourteenth century." The tiara as symbolical of priestly dignity or authority was used in the Jewish priesthood (V. Exod. c. 28, v. 40, Lat. Vers.). Long before the fourteenth century the Popes wore the tiara, but it had only one crown until Boniface VIII., in the thirteenth century, added a second, to which again Benedict XII., in the fourteenth century, joined a third crown, such as it is seen to-day.

In all probability your reviewer referred to the fourteenth-century extension; but, in this view, where is the incongruity of finding a Pope of the eleventh century whose head is adorned with the tiara? The author under review refrained from describing its form. It would seem that the reviewer was rather unhappy in his choice of an example to show the lack of scholarship in the work reviewed.—Yours truly,

F. G. H.

Rome, February 29, 1904.

THE DONNA LAURA MINGHETTI LEONARDO.

To the Editor of The Nation:

Sir: I beg you to give publicity to the enclosed note. Its appearance in print will dispel a rumor which has been spreading for I know not how long before faithful friends made me aware of it.—Yours truly,

B. Berenson.

New York, March 10, 1904.

Bernhard Berenson, Esq., New York:

My Dear Berenson: Referring to the rumors that you purchased for me the picture known as "The Donna Laura Minghetti Leonardo da Vinci," and that you received a large remuneration for so doing, etc.!—I purchased the picture without your knowledge or advice. You had not the slightest connection with the purchase, and did not know of it till some weeks thereafter, when I told you.

You may make such use of this letter as you please.—Always yours,

Theo. M. Davis.

Luxor, Egypt, January 7, 1904.

Notes.

Dr. William J. Campbell, a well-known bookseller of Philadelphia, is writing an elaborate work on St.-Mémin portraits. It will be in eight volumes, with more than eight hundred engraved portraits, all on separate pages. The basis of the book will be the famous "Collection" of 761 proofs, made by the artist himself, which has recently come into Dr. Campbell's possession. The Corcoran Gallery of Art and the Library of Congress, both of which have extensive collections, are coöperating with him, giving him the free use of any portraits that they possess which are not in his own collection. It will be a favor to him if any of our readers who have information, either biographical or genealogical, about any portrait that St.-Mémin made, or any information as to the present whereabouts of any original crayons, coppers, or engravings, will communicate with him. His address is 1218 Walnut Street, Philadelphia. Due credit will be given in the book for all information received.

Mr. John Cotton Dana, Librarian of the Public Library of Newark, N. J., and Mr. Henry W. Kent, Librarian of the Grolier Club of this city, have united to publish during the coming twelvemonth "a series of six reprints of rare and out-of-print seventeenth and eighteenth-century works on Libraries and their management," to wit, J. B. Cotton des Houssaye's 'Des Devoirs et des Qualités du Bibliothécaire,' the Rev. J. Kirkwood's 'Overture for Founding and Maintaining of Bibliothecks in every Paroch throughout this Kingdom,' Lipsius's 'De Bibliothecis Syntagma,' Bodley's Life and first draught of the Statutes of the Public Library at Oxford, Gabriel Naudé's description of the Library of Cardinal Mazarin, and John Dury's 'The Reformed Librarie-Keeper.' Subscriptions will be taken

only for the entire set, at $10; the edition being limited to 525 copies. The character of the presswork is assured by its proceeding from the Merrymount Press, Boston.

We select from Houghton, Mifflin & Co.'s spring announcements the following titles: 'Francis Parkman,' by Henry D. Sedgwick; 'William Hickling Prescott,' by Rollo Ogden; 'John A. Andrew,' by Henry G. Pearson; 'Napoleon,' volumes i. and ii. of four, by Col. Theodore A. Dodge; 'Kwaidan,' Japanese tales by Lafcadio Hearn; 'The Views about Hamlet, and Other Essays,' by Prof. Albert H. Tolman of Chicago University; 'The *De Monarchia* of Dante,' translated, with introduction and notes, by Aurelia Henry; 'English and Scottish Ballads,' a selection from Professor Child's great work, edited by George L. Kittredge and Helen Child Sargent; 'Whittier Land,' by his biographer, Samuel T. Pickard; and 'A Guide to the Birds of New England and Eastern New York,' by Ralph Hoffmann.

'Trusts of To-day,' by Gilbert Holland Montague, will be published directly by McClure, Phillips & Co.

'Problems of the Present South,' by Edgar Gardner Murphy; 'The History of American Music,' by Louis C. Elson; 'Old-Time Schools and Schoolbooks,' illustrated, by Clifton Johnson; a Life of D. G. Rossetti by Arthur Christopher Benson; and Palgrave's 'Golden Treasury of Songs and Lyrics' taken over in the "Pocket Classics," may shortly be expected from Macmillan Co., along with 'Lord Acton's Letters to Mary Gladstone' and Sir Leslie Stephen's posthumous 'Life of Hobbes.'

George W. Jacobs & Co., Philadelphia, announce 'Organized Labor and Capital,' the Bull Lectures for 1904, by the Rev. Washington Gladden and others.

The Jewish Publication Society, Philadelphia, Pa., is about to issue a book entitled 'The Voice of America on Kishineff,' edited by Cyrus Adler. The introduction gives a succinct account of the Kishineff outrages and a review of the effect the news of them created in the United States.

A. C. McClurg & Co., Chicago, will bring out 'The Evolution of the Soul, and Other Essays,' by the late Dr. Thomas J. Hudson, and 'Bird-Centre Cartoons,' by John T. McCutcheon.

The latest Clarendon Press "notices" embrace 'The Complete Works of Ben Jonson,' edited by C. H. Herford and Percy Simpson; Johnson's 'Lives of the Poets,' edited in three volumes by the late G. Birkbeck Hill; 'The Remains of Samuel Butler,' edited by Miss Edith J. Morley; Sir Thomas More's 'Utopia,' edited by J. Churton Collins; 'Keltic Researches,' by E. W. B. Nicholson; 'Documents relating to the French Revolution,' 1789-1791, edited by L. G. Wickham Legg; 'Industrial Organization in the 16th and 17th Centuries,' by G. Unwin; a 'Colloquial Egyptian-Arabic Grammar,' by William H. Lyall, and 'Indian Housekeeping Hints,' by Mrs. A. C. Wilson.

Since the Orient has the floor, Mr. Edward Carpenter needs and makes no excuse for a second edition of his lively narrative, 'From Adam's Peak to Elephanta: Sketches in Ceylon and India' (E. P. Dutton & Co.). We reported upon it at considerable length nearly ten years ago, and it is now unchanged except for some little correction, the insertion of two portraits, and an appendix on the present financial condition of India, inasmuch as terrible famines have intervened since the text was originally penned. Mr. Carpenter's view of the future is not cheerful.

A pertinent and timely excerpt has been made of Part II. from Volume IV. of Lucas's standard 'Historical Geography of the British Colonies,' resulting in a small and comely volume entitled 'Geography of South and East Africa' (Oxford: Clarendon Press; New York: H. Frowde). It is provided with six maps, and Hugh Edward Egerton has supplied chapters on the Transvaal and Orange River Colony. A useful index to the principal proper names should be mentioned. The work is purely non-political, and deals only with British possessions.

It is quite exceptional to have a substantial text-book derived from a foreign language wholly retranslated, and by a new hand, after more than a decade's use and apparent popularity in the schools. This is what has happened to Professor Gide's 'Principles of Political Economy,' published in 1891, and now once more, by D. C. Heath & Co. The present translator is Prof. C. William A. Veditz, and he has reproduced the eighth French edition, but with a sort of Americanization, replacing Old World examples with our experience, as in tariff legislation, adding "whole paragraphs and pages" to some of the sections on "Distribution and Consumption," and omitting Gide's appendix on French finance. We note this commendable treatment without repeating the examination which we gave to the earlier version.

Fifteen years, with all the steady rise in the cost of living and of social entertainment, have not diminished Mr. Philip G. Hubert, jr.'s, faith in the underlying soundness of his economic idyll entitled 'Liberty and a Living,' "the record of an attempt [on the south shore of Long Island] to secure bread and butter, sunshine and content, by gardening, fishing and hunting" (G. P. Putnam's Sons). He accordingly puts it forth anew with a stout-hearted preface; and agreeable reading, if not convincement, may be promised those who follow him. The idea at least is stimulating, and the book is an enemy to waste.

The gazetteer that N. W. Ayer & Son's 'American Newspaper Annual' might fitly be called, makes its annual appearance from Philadelphia in a great volume of nearly 1,500 pages apart from the advertisements. It merits a place in every business office, and is a very convenient resort for population, railroad, and express information, in addition to general physical descriptions of the larger areas of the country, and fifty-eight colored maps. Nor are foreign periodicals neglected. The names of the editors accompany other data desirable for advertisers. The publishers spare no pains to maintain the Annual's reputation for freshness and accuracy.

Fresh series of reprints challenge the attention and the purses of buyers. The newest from Methuen & Co., London, entitled "Rariora," has the peculiarity of disregard of uniformity, because the rather rare originals are copied "page for page" as well as "error for error," or, in common phrase, verbatim. Beginning is made with Shelley's 'Adonais,' from the edition of 1821. There is a facsimile of the Pisa title-page; but the preface and poem are set anew, albeit slavishly. The cover is a granite blue, and bears a white label, with a pretty effect.

Of American provenance is the "Belles-Lettres Series" of D. C. Heath & Co., Boston, just begun with Goldsmith's "Good-Natured Man" and "She Stoops to Conquer," with an introduction by Austin Dobson; and "Eastward Hoe," by Jonson, Chapman and Marston, and Jonson's "The Alchemist," edited by Prof. Felix E. Schelling. The general editorship has been entrusted to Prof. George P. Baker of Harvard. These squarish little volumes have an old-fashioned, individual appearance, and have the merit of a sufficiently bold type and unglazed paper. A frontispiece will apparently be the rule, and, besides the notes, a bibliography and a glossary. The older spelling is retained, but not the capitalization or punctuation; and variants are recorded, very instructively, as may be imagined. The enterprise deserves consideration both in and out of educational circles.

Prof. Frederick J. E. Woodbridge's 'The Philosophy of Hobbes in Extracts and Notes collected from his Writings' (Minneapolis: The H. W. Wilson Co.) is, we presume, well adapted to the use of hearers of a particular course of lectures, though hardly sufficient by itself, perhaps, for an understanding of Hobbes. It contains some 370 pages from the 'Leviathan' and from the 'Elements of Philosophy concerning Body' (the *De Corpore*). As a rule, we have not been particularly favorable to such volumes of extracts from philosophical writings that are easily obtained in their entirety, and which would seem to be worth reading in full by anybody interested in philosophy. If he has not the time to do so this season, let him have the book within reach, and some day he will read it. About Spinoza a considerable class of persons have a burning curiosity that can quickly be appeased, so that a book of Extracts from him is all very well. But for such smooth reading as Locke, Reid, and especially Hobbes, with his strong style and interesting cast of thought, we really do think it a pity to encourage fragmentary reading. It is not as if there were not editions of his works to be had at moderate prices—beautiful editions, too, while the presswork of this volume is no better than indifferent. The 'Leviathan' may be had, well-printed *in extenso*, for less than the price of these extracts. On the other hand, the extracts from other writings of Hobbes here printed as notes do add decidedly to the value of this edition; and the portrait is well reproduced.

A very small book with a very long title is William J. Hammer's 'Radium and Other Radio-active Substances, Polonium, Actinium, and Thorium, with a consideration of Phosphorescent and Fluorescent Substances, the Properties and Applications of Selenium, and the Treatment of Disease by the Ultra-Violet Light' (D. Van Nostrand Co.). It gives a good popular account of the state of these subjects less than a year ago (though as to fluorescence and phosphorescence insufficient); and nothing very essential has since come to light.

A translation of Dr. H. Hovestadt's volume on 'Jena Glass' and its scientific and industrial applications is published by Macmillan. The book contains chapters on the optical properties of glass, and the perfecting of optical systems by the use of the

new glasses which are the product of the Jena factory; and others on the mechanical, thermal, electrical, and magneto-electrical properties, and the behavior of glass surfaces towards chemical influences. An introduction gives a very interesting account of the origin and development of this notable Jena industry. The impulse was given by a paper by Abbe which appeared in 1878, in which he discussed in detail the requirements to be satisfied if any real improvement in the performance of refracting instruments was to be obtained, and arrived at the conclusion that the matter lay chiefly in the hands of the glassmakers. If the glassmaker would leave the beaten track and make a methodical study of the optical properties of the chemical elements in combination, new varieties of glass might be discovered which would meet the requirements. This paper led Dr. Schott, who was interested in glassmaking by family tradition as well as by personal study, to undertake the suggested work. In 1881 he began, in conjunction with Abbe, a joint investigation of the difficult problems, viz., the production of crown and flint pairs with proportional dispersion throughout the spectrum, in order to obtain a higher degree of achromatism; and the attainment of greater diversity in the two chief constants of optical glass—mean index and mean dispersion. This investigation was practically completed before the end of 1883, and it was decided to establish a factory for the wholesale production of optical glass, of both the old and the new varieties. The first price-list of the Jena Glass Works, issued in 1886, contained 44 optical glasses, of which 19 were new. By the employment of these and other new glasses which have since been added to the list, many important improvements have been effected in the lens systems of microscopes, telescopes, and photographic cameras. The Jena factory has always carried on its work hand in hand with scientific research, and in the course of its development other new branches of manufacture have been taken up. The most notable of these are the production of the well-known "normal" thermometer glass, and glasses characterized by special powers of withstanding heat and chemical attack, which have rendered them very important for both scientific and commercial uses. The translation and editing by J. D. and Alice Everett deserve praise.

The researches of Fernand Baldensperger, the successor of the late Joseph Texte as professor of comparative literature at the University of Lyons, are well known to students of the Romantic period. His learned monograph on Gottfried Keller has been followed by a series of minuter studies on the relations between French, German, and English literatures from the end of the eighteenth to the middle of the nineteenth century, among the more recent being one in the *Journal of Comparative Literature* on the influence of Lewis's 'Monk' in France. His latest work, 'Goethe en France: Étude de littérature comparée' (Paris: Hachette), is a stately octavo of some four hundred pages, traversing the whole history of Goethe's influence on French literature from the first critique of 'Clavigo' in the *Journal Encyclopédique* in 1774 to the present day. The history of this influence M. Baldensperger divides into four parts, which represent chronologically the growth of interest in Goethe and his works—first, as the author of 'Werther,' secondly, as the dramatic and lyric poet, thirdly, as the scientist and philosophic novelist, and, lastly, as a remarkable personality typical of modernity. The whole is an illuminating synthesis of a great poet's influence on a foreign literature, carried out in a most comprehensive spirit, and devoid of all merely erudite critical apparatus to distract the scholarly reader. The specialist is to be appeased, however, by the publication of a supplementary Bibliography in the near future.

The salient feature of the *National Geographic Magazine* for March is Mr. Henry Gannett's description of the Philippines, which is a summary of useful information, including a topographic account of the larger islands, and facts about the climate, products, and people. The uniformity of the climate is remarkable, the range in the monthly mean temperatures of the year at Manila being "only 7 degrees —*i. e.*, from 77 degrees in January to 84 degrees in May." The monthly range in Washington is 46 degrees, and the highest temperature on record in that city is 104 degrees, which is 4 degrees above the highest in Manila; the lowest is —14 degrees, or 74 degrees below the lowest in Manila. The fertility of the soil is shown by the fact that a "few thousand square feet, the area of an ordinary city house lot, are sufficient to provide the Tao and his family with all that they require—a few bananas, a little rice, and *camotes* or sweet potatoes." This number of the magazine also contains Mr. H. B. Miller's account of Harbin, the centre of the Mantchurian railway system, which was originally published in the series of Daily Consular Reports. The illustrations are numerous and well-chosen, and a copy of the map of Korea and Mantchuria, with inset plans of Port Arthur and Vladivostok, prepared by the War Department, is issued as a supplement to the magazine.

In the customary generous bill of fare in the *Harvard Graduates' Magazine* for March we have found food for thought in some of the minor items. Amid sums in the hundreds and thousands "gratefully accepted" by vote of the Corporation, it is refreshing to meet with an "anonymous gift of $5, for the purchase of books on Dutch History for the College Library." The amount cannot go far, but the example should. Significant now is the report of the annual meeting of the Harvard Club of Japan at Tokyo on October 20, last, by a Japanese member. Among the obituaries we remark the death in Iowa of a New Hampshire man of the class of 1843, a colonel during the civil war, afterwards associate justice of the Supreme Court of Wyoming Territory, "where he was active in obtaining the full enfranchisement of women." In pathetic contrast is the biography of a member of the class of 1862, who left college in his junior year to enlist for the rebellion as a Mississippian, and afterwards became a leading educator, but he would never reknit old associations with his Northern classmates. His want of a degree kept him from obtaining a Southern professorship, and, on this transpiring, the College was induced to bestow the degree out of course. "Before he could receive it, he was struck down by paralysis."

A list of books on economics compiled by Benjamin Rand, Ph.D., helpful to students and librarians, will be found in the Boston Public Library Bulletin for March. It consists of the titles of 551 works, with prices annexed, by 384 authors. Another list shows the notable place Whistler occupied in art and literature, gathering thirty-one titles of books by, about, or illustrated by him, and eighty-six magazine articles having reference to him.

Perhaps the most remarkable instance in recent times of the rapid development of a purely virgin region into a rich and prosperous state is to be found in the Malay Peninsula. In a communication to the London *Times*, Sir Frank Swettenham, since 1874 a resident British official and now the Governor of the Straits Settlement, thus summarizes the facts: "In less than thirty years four small Malay States, jungle-covered, pathless, unknown, have been turned into flourishing communities with a total revenue of over two millions sterling per annum, a trade of ten millions sterling per annum, three hundred and fifty miles of excellent railway, thousands of miles of roads and telegraphs, great public buildings, schools, hospitals, waterworks—in fact, all the machinery of the most modern administration—with no debt of any sort, and a balance of over one and a half millions, ready to be spent on further railway extension and other works of development." Three things have contributed to this great success—the tin mines, cheap Chinese labor, and, most important of all, able and intelligent rulers. For it can hardly be doubted that if the British Government had failed to secure men to represent it who sought to understand those whom they ruled, and who made their interests their chief aim, the country would have remained practically a pathless jungle.

The late Parke Godwin was among the celebrities whom Mr. F. Gutekunst, Philadelphia, secured for his gallery, and we now have from that photographic studio a strong and faithful likeness of him on a half-life-size scale. The physical and mental vigor of the editor, writer and orator, so long a familiar figure in New York, is well exhibited in this print.

—Houghton, Mifflin & Co. publish simultaneously two more volumes of their Centenary Emerson, 'Conduct of Life' and 'Society and Solitude.' The editor's notes and introductions throw much valuable light on the Essays, and qualify some opinions that have heretofore had wide currency. Both books belong to the second half of Emerson's life, if such a division is a valid one. The editor's notes have, in each volume, a general introduction covering the period elapsing in each case since the publication of the next previous volume. These introductions are particularly interesting as showing Emerson's relation to the anti-slavery conflict in the fifties and to the civil war and its outcome in the Reconstruction period. But the relation of the two volumes to these decades is not so close as has been commonly supposed. The Essays had all served as lectures, and the lectures had taken up into themselves much matter of earlier date, so that those who have inferred from them Emerson's immediate character, have frequently been building on the sand. At the same time it is plain that Emerson had a later manner, broadly represented by these essays, which was different from the earlier, more sci-

entific, more concrete, more practical, more generally apprehensible. His editor finds it less the manner of the preacher, more that of the lecturer. Remaining "to his native centre fast," Emerson ran out the application of his doctrine more and more into men's everyday affairs. Of the editor's special introductions, that to the essay on Clubs is the most elaborate, showing in what manner and degree Emerson was a clubbable man. In the notes we find some repetitions, but the fresh part is always dominant. Mr. Edward Emerson's success in identifying the individuals of his father's miscellaneous company of persons and quotations is quite remarkable. His cross-references to other essays, and especially to the poems, are an agreeable device. The quotations from Emerson's journal are most welcome, so often have they a pungency denied to the deliberate public form. The son's memory, as in the earlier volumes, furnishes many interesting circumstances and traits. We are told that the "Farming" essay was originally called "The Man with the Hoe," anticipating the title of Millet's picture and Mr. Markham's poem. We had hoped that Mr. Edward Emerson's art training would make him a bolder critic than he is here of some of his father's fanciful constructions in the "Art" essay.

—If we are to credit the statements of the editor of 'The Story of the Lopez Family: A Page from the History of the War in the Philippines' (Boston: James H. West Co.), nothing quite like this collection of letters has ever before "been received from the 'dreamy East.'" In fact, the whole thing is very much in the superlative degree. The book is published primarily, it is to be supposed, in order to give to the public the letters which passed back and forth between the Lopezes—at Manila—and Sixto Lopez and his sister Clemencia when in Hong Kong, and later in the United States endeavoring to secure from the President an order for the release of three of their brothers, who had been arrested by Gen. J. F. Bell in the course of his campaign, and who were being released, as a result of the close of that campaign, almost at the same time the President was refusing to interfere. These letters had already appeared in Senate Document 331, Fifty-seventh Congress, first session, which has had wide publicity, and they were there accompanied by the quite complete summary of the facts brought out not only by them, but also by other evidence on the case, written by Judge Magoon, law officer of the War Department. Not satisfied with this summary, the editor of these letters, Canning Eyot, is rather bitter and sarcastic in discussing portions of it. The book does not, however, publish Judge Magoon's statement of the case; hence the Senate document referred to is still the fairest source of reference for those who are particularly concerned about this case. The editor has employed some forty-five pages out of the two hundred odd in introducing the Lopez family to us and making the Philippine revolution centre about them, and his comments on the letters as they proceed are frequently as long as or longer than the letters themselves. Even those who think his cause a good one are likely to find his exaggerations wearisome. He speaks of a lady member of a Boston family as one "whose kindness to Miss Lopez will do more for the real peace of the Philippines than 'Cæsar's legions,' and more to heal the wound than the combined wisdom of statesmen." He tells us that a certain ex-Rough Rider officer and ex-sheriff of New Mexico, who for reasons of his own was on intimate terms with the Lopezes in Manila, "probably knows more about the Filipinos than any other American in the Philippines." He assures us that "these letters will become historical." Reiterating what Sixto Lopez has frequently said, he asserts that José Rizal's "final dictum was that there was no salvation for their country short of separation from Spain," which Rizal himself denied with his last breath, not to say in his best-known writings. Among the photographs, which in the main are devoted to reproducing the Lopez family before us, one is of José Maria Basa of Hong Kong, who is called "the Grand Old Man of the Filipinos."

—"The Dispatches of William Perwich," which have been edited by Mr. M. Beryl Curran for the Royal Historical Society, relate chiefly to the affairs of France during the years 1669-1677. Perwich was an English agent in Paris, but beyond this fact little is known about him save that he had an excellent command of French and was thoroughly familiar with the means of procuring political gossip. It is quite clear from the smallness of his salary that he did not belong to the higher ranks of the diplomatic service, and a letter of 1677 from Lord Montagu to Arlington shows that his personal habits interfered with his efficiency as a collector of intelligence. "Mr. Perwich," says Montagu, "is at a stand, though he can seldom stand, for he is most eternally drunk." But, with all his shortcomings, Perwich must have had some useful attainments besides his knowledge of the Bohemian quarter and his acquaintance with spies. The information which he supplied to Sir. James Williamson and Lord Arlington was kept distinct from the other French dispatches, and at certain moments (for instance, in 1672) seems to have been thought highly important. "The special value of the Perwich Papers," says Mr. Curran, "consists in the light which they throw upon the history of France between the Treaty of Aix-la-Chapelle and that of Nimwegen. . . . The main portion of the letters is concerned with the designs of France to break up the Triple Alliance and to increase the power of the Great Monarch, both on land and sea." There is less in these letters than we might hope to find regarding the plot of Roux de Marsilly and the Treaty of Dover. By way of compensation, De Rohan's conspiracy of 1674 is described with remarkable minuteness. One is strongly impressed by the amount of miscellaneous detail which Perwich sees fit to transmit. He might almost have received his training as a writer of news-letters, to judge from many of his entries. When he begins to make citations from Nostradamus we see that the political correspondence of the seventeenth century covered a wide field. While these papers are not of anything like primary importance, they throw some light on one of the most important periods in the reign of Louis XIV.

—The late Prof. E. A. Freeman did not like the manner in which Mr. Augustus J. C. Hare compiled his guide-books, and took occasion to express his convictions in print in terms that contained in vigor and precision what they lacked in sweetness. The English-speaking travelling world does not appear to share Professor Freeman's views on that subject. It has continued to buy and to read Mr. Hare's books in increasing numbers, and to find through them an easy and flowery path to archæological and historical culture. His 'Walks in Rome' (Macmillan) has now reached its sixteenth edition, and has been subjected to thorough revision, partly by the author before his death a year ago, and partly by Mr. St. Clair Baddeley, whose interest in Roman topography we have not been allowed to forget. The main part of the revision is naturally concerned with the changes that have taken place in Rome in recent years through rebuilding and excavation, and there is something of the Jekyll-Hyde puzzle in it. The reader is left to reconcile as best he can the familiar woes of Mr. Hare over the destruction by the "Sardinian" Government of all the mediæval beauty of Rome, with the archæological smiles of Mr. Baddeley over the discoveries that have thus been brought to light. It is a pity that the references to ancient matters could not have been done by a less amateurish hand. There has been improvement in this direction, but the revision has not been carried far enough. Old blunders have been in many instances perpetuated, Canina's authority being still cited for identifications long since given up by scholars; and on newer points the not always safe speculations of Comm. Boni (who is justly praised) have been blindly followed without regard to the judgment of archæologists upon them. The writer, perhaps, is unacquainted with German, and does not know that other persons than two or three Englishmen and one Italian have done something with the study of Roman topography since Canina's time. Archæologists who, in their turn, may not be acquainted with Mr. Baddeley's achievements in their field, will doubtless be edified by his statement in the preface: "Owing to the munificence of his friend, Mr. Lionel Phillips, the writer has been enabled to bring entirely within prospect of completion a design for reaching the Forum of Nerva and isolating the Temple of Antoninus and Faustina by means of excavating the Basilica Æmilia, which he conceived independently in 1898, and which, with the cordial cooperation of the Italian authorities, has already borne substantial results. For this his sincere thanks are due to [Baccelli, Fiorilli, and Boni]."

—Prof. A. G. Billaudeau's 'Recueil de Locutions Françaises,' carefully revised by Prof. A. Antoine (Paris: Boyveau & Chevillet; New York: G. E. Stechert), contains some fifty thousand words and phrases in current colloquial or literary use, with their idiomatic English equivalents—a most serviceable adjunct to student and teacher, and of hardly less value to those whose approximately exact bilingualism often fails them in this particular respect; for there is in translation admittedly no task more difficult than the rendering of stock or proverbial phrase without any loss of raciness, of the *goût du terroir*. As might naturally be expected, however, the English versions here and there convey a slightly foreign flavor. "Chercher une aiguille dans une botte de

foin" is "to look for a needle in a haystack," not "a stack of hay." "Un amour d'enfant" may be rendered literally "a love of a child," not a "darling"; "Il est dans le bourbier," by "He is in a mess" or "a pickle" rather than by "mud" or "hole." "Bourre," as applied to literary work, finds its equivalent in "padding," rather than in "stuff" or "trash"; "Calendes grecques" is as familiar in English as in French, and needs no explanation, though we know of an alderman who proposed to defer discussion "aux *quarante* Grecs," when seeking to give a motion what our Canadian neighbors call the six months' hoist. "Prendre la cendre et le cilice" loses in "doing penance" what conventional "sackcloth and ashes" would preserve. "Dire son confiteor" we usually translate by "cry *peccavi*." "C'est un vrai *melon*" is slang, and better conveyed in "duffer" than in "muff." "Pot de vin" would (by Americans, at all events) be better understood as "graft" than as "a good-will." "On ne peut pas peigner un cheval qui n'a pas de crins" finds more than one paraphrase, but we know of none more precise than that which suggests the impossibility of relieving a Highlander of his breeches, once offered by a Scotch schoolboy as conjectural vernacular for *Ex nihilo nihil fit*.

HENRY VILLARD.

Memoirs of Henry Villard, Journalist and Financier. 1835-1900. Boston: Houghton, Mifflin & Co. 1904. 2 vols. Maps and portrait illustrations.

Born in Speyer in 1835, and arriving in this country only in 1853, at the age of eighteen, Heinrich Hilgard, the future Henry Villard, is truly to be reckoned among the emigrant "Forty-eighters." The Revolution both enlisted his boyish sympathies and brought him into conflict with the authorities, drew upon him the censure of his conservative father (a member of the Bavarian judiciary), and so perturbed the scheme of his university education as to make the New World seem the only escape from declassification in the Old. This youthful tragedy is outlined in the Introduction to these Memoirs, the only chapter not proceeding directly from Mr. Villard's pen, and avowedly the merest abstract of the full and engaging narrative of his Fatherland days written in German in behalf of his family and transatlantic friends, for whom it was privately printed after his death in 1900. A judge of physiognomy, however, will discover in the large head and idealistic expression of the boy of thirteen, as shown in the daguerreotype group, a sufficient explanation of want of studious application and pliability to the conventional mould.

The special attractiveness of the United States, as compared with France, England, South America, or Australia, lay in the fact of an antecedent family migration to Belleville, Ill., in the early thirties, embracing his great-uncle and uncle Hilgard, men of character and training and democratic principles, whose expatriation had all the moral significance of the *Mayflower* pilgrimage. The young Hilgard took ship from Hamburg for New York, and landed penniless and speechless, for he knew nothing of the English language. The first year was spent in the most discouraging endeavors to gain a livelihood, in the course of a slow Westing which gave him a bitter but useful acquaintance with Ohio and Indiana before he finally joined his kinsmen in their thrifty and hospitable rural settlement. These adventures are treated in considerable detail, and are interesting not more because of their contrast with the autobiographer's final attainment of fortune and distinction, than because of their vivid suggestion of immigrant hardship at a time when the country was still far from being overpopulous, and in the case of a nature touched with genius.

Most important for the young Hilgard's future was the unrecognized beginning of the civil war in the Kansas-Nebraska struggle, and this, after some futile attempts to study law at Belleville and Peoria, led him into politics and journalism, inevitably by way of the Free Soil party. To this period belongs a naïve plan of German free-soil colonization in Kansas—prophetic of larger and solider projects in maturer years, and demonstrative of the power to persuade and to inspire confidence in his schemes which were afterwards to be so brilliantly illustrated. The Frémont campaign led him to become the editor and ultimate proprietor of a German party organ in Racine, Wisconsin, while Eastern visits laid the foundations of an extensive acquaintance with the chief editors and newspaper offices of New York, particularly of the *Tribune* and the *Staats-Zeitung*. He passed from being a Western canvasser for the latter journal to reporting for it the Lincoln-Douglas debates of 1858. His journalistic career was now fixed, and, even when in Eastern employ, the West became the special field of his activity and development, and of that contact with public characters which served him so much in stead in his own rise to prominence and power. His familiarity with Lincoln in particular, whom he saw daily after his election at his home in Springfield, Illinois, and accompanied on his journey to Washington as far as New York, gives an historic value to the pages in which his observations are set down—from the intimate talk about religious belief, in a box-car at a lonely railroad station in Illinois, to the scene where Senator Henry Wilson takes Mr. Villard to the White House to relate the disaster to the Union army at Fredericksburg—the first unofficial tidings. Here is to be noticed the repulsion which the coarser side of Lincoln's thought and speech caused the foreigner who had roughed it in the West without being subdued to what he worked in. But while it was hard through such a veil to read in advance the greatness of "the first American"—in Lowell's phrase—Mr. Villard judges his true merits with fulness of admiration, and leaves the Lincoln legend unsullied except on the side of breeding.

Before the combatants of the civil war had come out into the open, and even before he reported Lincoln's nomination at the Chicago convention, Mr. Villard was sent to the Colorado Pike's Peak gold fields, and was the first and sole passenger by stage-coach to the budding Denver. This interlude of the Memoirs has an agreeable *al fresco* flavor, abounds in spirited and buoyant description, and is marked by incidents, like the wrecking of Horace Greeley's stage by a herd of buffaloes, that recall a time long past. Between Mr. Villard's witnessing Lincoln's inauguration and his own return from New York after a consultation with his new employer, James Gordon Bennett, founder of the *Herald*, occurred the Baltimore riot against the passage of the Sixth Massachusetts Regiment; and the consequent impediments to his progress to the capital usher in the war chronicle which the Memoirs now become for more than half their bulk.

As a field correspondent, Mr. Villard witnessed and graphically describes the first battle of Bull Run, took part in the first campaign in Kentucky and the middle South, entered Nashville in advance of Buell, was with that general in the retrieving of Shiloh on the second day, and at the so-called "siege" and occupation of Corinth, and in the scurrying retreat for the saving of Louisville against Bragg. The general view of these operations, together with the subsequent battle of Perryville, is a chapter out of the common, especially for Eastern readers. Transferred by the *Tribune* to the Army of the Potomac, Mr. Villard was in the midst of the slaughter at Fredericksburg, and the personal element in these military chapters nowhere stands out so fully and picturesquely as in the account of his evasion of Burnside's orders against civilians leaving the lines, and his carrying of the heart-breaking news to Washington, as already mentioned. Dispatched immediately to Port Royal, he was the sole newspaper correspondent who participated in Dupont's fruitless attack on the Charleston forts, being admitted on board the *New Ironsides*. His next employment was with Rosecrans at Murfreesboro' and to the very end of that general's career, including the siege of Chattanooga, but not the battle of Chickamauga, as he had to be sent North in consequence of a dangerous fever. This break in the continuity of his war narrative Mr. Villard laboriously repaired (in after years) by study of the Official Records (embracing both sides); and, intricate as the course of events is, and impossible of certain determination, the story falls little if any short, in interest, of those which proceed from the writer's immediate experience. The raising of the siege of Chattanooga is depicted with animation up to Sherman's advance on the day following the "battle above the clouds." Then Mr. Villard's tired pen dropped from his hands. Book VIII. opens with the briefest mention (in the third person) of the Wilderness campaign, from which Mr. Villard was again the earliest bearer of intelligence to Washington, and of the investment of Petersburg and the mine explosion. Recalled after that to Europe by his reconciled family, Mr. Villard ceased to be a journalist except for a brief period of service with the Chicago *Tribune*, at Washington and abroad.

While Burnside, Hooker, Garfield, Nelson, Thomas, Grant, Buell, Halleck, and Sherman are exhibited and estimated from a close point of view, Rosecrans is the chief study, as, on the Confederate side, is Gen. Bragg. Sherman's retirement from Kentucky was caused by an editor's misuse of a private letter from Mr. Villard, giving the current rumor of this far-seeing commander's "insanity." He figures in these volumes not as the conquering hero; nor does Grant, whose negligence at Pittsburgh Landing Mr. Villard cannot excuse. Burnside is visited with the severest censure

of all. On the whole, we believe the most jaded reader of histories of the civil war will find here fresh matter of lively interest, and broad views of conditions like that of Washington during the formation of the Federal army, or of Kentucky before operations began, such as are hardly to be found elsewhere. The accompanying maps are sufficient for orientation.

The accident of marrying a Boston lady, the only daughter of William Lloyd Garrison, was the cause of an episode not to be overlooked, viz., Mr. Villard's engagement as secretary of the American Social Science Association, whose headquarters were in that city. This had an important bearing on the growth of the civil-service reform movement, and led to personal relations with Mr. Godkin, editor of the *Nation*, which culminated, in the days of Mr. Villard's financial success, in his purchase of that paper and the *Evening Post* in the interest solely of independent journalism, pure politics and honest standards of government.

The final chapter cannot well be summarized. It is a compact statement of the circumstances by which Mr. Villard, while residing in Germany in the early seventies, was called in to consult with bondholders of defaulting railroads in this country, with the result of his embarking in the completion of the transcontinental line of the Northern Pacific Railway, and becoming one of the financial magnates of Wall Street. This survey of a period of scant twenty years is more romantic than all that has gone before, being not less full of vicissitudes as well as of alternations of public applause and odium—"revivals, too, of unexpected change." Here is to be glimpsed the expansion under prosperity of one of Nature's noblemen, a public benefactor in both hemispheres, the idol of the northern Pacific Coast, to which he had opened the overland approach, the honored and fêted son of his native country. If Lincoln was the chief historic personage of the first volume, Bismarck is of the second, and nowhere does Mr. Villard as a writer appear to better advantage than in rehearsing his memorable conversations with the ex-Chancellor at Friedrichsruhe. We have room for but a single quotation (vol. ii., p. 348):

"The Prince then began to question his guest regarding himself, about his early life in Germany, how long he had been in the United States, and about the course of his career there. He wanted to know how many miles of railroad he had built, in what time it had been done, how many steamships had been under his control, how many men he had employed, being very much surprised that 15,000 Chinamen had been among them, and saying: 'Why, you had a whole army corps under your command!' He asked how much capital Mr. Villard had been obliged to raise and how it was raised, and about the relative value of white and Chinese labor. He inquired whether he had named Bismarck, the capital of Dakota, after him, to which the guest had to reply that the place had been founded and baptized before he had anything to do with the Northern Pacific. Bismarck remembered that he had received thence telegraphic greetings from the German participants in the Northern Pacific opening excursion, and asked whether it had a future. In reply, Mr. Villard had to confess that it was not then very prosperous, and he explained that all the capitals of the several American States were as a rule of slow growth. This the Prince could not understand in the light of the contrary European experience. He remarked that what his guest had accomplished in a foreign country, he never could have done in the Fatherland, owing to tradition and to the clinging to accustomed ways so characteristic of old countries. Did he not encounter a great deal of prejudice among native Americans against him as a foreigner in the pursuit of his undertakings? To this Mr. Villard replied that, on the contrary, he had found his chief financial backing and his main support among them, and that there was no people on earth among whom enterprise and energy prevailed to a greater extent, or that more readily appreciated those who possessed such qualities. To this the Prince said that he was well aware that the Americans were the most progressive people in the world, for which he admired them, but it was new to him that they were so free from national jealousies in appreciating merit."

The index to these handsome volumes ensures their utility as works of reference. They will attract a wide class of readers in every part of the continent.

THE METRIC FALLACY.

The Metric Fallacy, by Frederick A. Halsey; and *The Metric Failure in the Textile Industry*, by Samuel S. Dale. D. Van Nostrand Co. 8vo, pp. 231.

The adoption of the metric system would have real advantages. It would also have real disadvantages. Are the former so assured and so great as unmistakably to overbalance the latter?

The serious advantages of the metric system, itself, are two. The first arises from its decimal subdivisions, and this, so far as it goes, is a sound argument for the full adoption of it. Yet we are apt to overrate it, because we think of the conveniences of our decimal money, without considering how much more frequently sums of money have to be added by ordinary people than weights and measures have to be arithmetically operated upon. The second advantage of the metric system lies in that system's furnishing a universal commercial language for weights and measures. We believe this to be the greater advantage of the two; but it affords no argument for any modification of our laws, since everybody is already free to express himself in metric units. The law of 1866 (due to Messrs. Kasson and Julius E. Hilgard) protects him in doing so, and he is sure to be understood. Other advantages are claimed for the system, but any impartial person will easily satisfy himself that they amount to little. Thus, is is averred that the simple and elegant relations between the different kinds of units of the metric system would be important. No doubt they would for a small number of scientific men, not a hundred thousand all told. But these all use the system already. They seem to be very desirous that the unlearned, too, should be able with equal readiness to interconvert mass, length, and capacity; but really this cannot be a vital advantage even for the scientific class; and when it is divided by the ratio of the whole population to the number of this class, it evidently becomes insignificant. For the great body of the people, the relations between the old units of mass, length, and capacity are about as handy. They are not generally very well known, for the reason that they are not generally very important.

It is further pretended that the adoption of the metric system would lighten the tasks of schoolchildren so much as to afford an argument of national importance for its adoption. The idea presumably is that they would no longer have to learn the tables of weights and measures. But, as matters now are in this country, children need to be required to learn but a small part of those tables; and that little they would still need to know just the same. For, not to dwell on the fact that the books that speak of the old measures, as well as the things made according to them, would still endure, Mr. Halsey conclusively shows in the volume before us that the old units would persist, and with them the need of knowing them. Finally, it is said that another advantage of the change would be that manufactured articles would be made of the same sizes the world over; that such things as bolts, screw-threads, machinery, textile fabrics, etc., would have such uniformity that our manufacturers could begin to compete in the markets of Continental Europe. Surprising as it may be, there actually are intelligent and educated men so utterly ignorant of the condition of their own country's business and of its relations with other countries, and who are so ignorant of their own ignorance, that they are not ashamed to talk more or less like this before the faces of those who are acquainted with such matters. Much more worthy of attention is the counterclaim that our abandonment in our manufactures of a unit of the international importance of the English inch would bring disaster upon the country. This is, indeed, the greater of the two main arguments against Congress proceeding any further than it has already done in the direction of favoring the metric system. The other argument is drawn from the intrinsic inconvenience of a decimal system, especially when employed, not merely as a part of language, a mode of expressing quantities, but as regulating doings and makings.

That the number *ten* is an unfortunate base of numeration is generally agreed by those who have inquired into it. Indeed, it is so decidedly so that several men otherwise remarkably intelligent have actually proposed that it should be given up, and that a power of two (they mostly prefer sixteen) should be used in place of it. This is sheer insanity. Yet it is worth notice as showing that our retention of *ten* is pure conservatism, and as consequently affording a warning against the follies to which unmeasured rationalism in regard to weights and measures, like all unquantitative discussion about quantities, may lead. The effect of the inconvenience of this base of numeration has been that while it has mainly governed our expression of quantities, yet our practical dealings with these have broken away from our system of expression and have been regulated by other factors of subdivision. There are two principal cases. In the first place, when our subdivisions are used additively, as, for example, in weighing anything by placing weights in one pan of a balance, everybody knows the great convenience of successive bisections. We virtually put to the balance a series of questions answerable by *yes* or *no;* and the most expeditious way of reaching the desired result is by so putting the questions as always to bisect the possibilities. In this case, subdivision by ten causes a loss of time and energy amounting to 2.35 per cent. The other principal case is where it is desired to have within certain limits so many sizes of some article, say screw-bolts, that the ratio of each size to the

size below it shall never exceed a certain value. If there be an unnecessary variety of sizes, not only will more capital be locked up in keeping them on hand, which aggregates something, but, what may rise to any degree of importance, in an emergency the particular size needed may not be found in the store.

Take a typical case of continual happenings. A refrigerator car of strawberries from California broke down in the desert for want of a bolt. But that bolt was of the Sellers system of sizes, which prevails the world over, except in England, and even there is much used. Here, there is no other system, and therefore the size wanted was sure to be procured in the nearest store, and was found, and the car went on after half a day's delay. Suppose, however, that the metric system had been in use, with the Armengaud system of bolts, now struggling for existence in France against the Sellers and Whitworth systems. That system has forty-one different sizes for the interval covered by thirty-one sizes in the Sellers system. The chance of replacing the bolt in time to save the precious cargo would have been much less. Besides these two principal inconveniences of decimal subdivisions, there are others of an obscure nature whose effects are certain to be felt by every mechanic.

Of the main disadvantage which the change would involve, we must now endeavor to give our readers some slight idea. Although manufactures engage but a quarter of our gainfully occupied population, and do not therefore constitute our highest material interest, yet their annual products amount probably, by this time, to full equality with those of Great Britain, Germany, and France, put together, even after subtracting from the nominal value of ours 25 per cent. for the illusory magnification produced by our tariff. Our population, it will be remembered, is only half of theirs. We owe this proud position to several causes, of which the first —to generalize as much as possible—may be said to be American systematization. The most prominent effect of this has been the supremacy of American machinery, which is absolute. The greatest factor in the attainment of this supremacy, greater perhaps than the American genius for simplification or than American ingenuity, was, we believe, the thorough systematization of American machinery early brought about by the labors of Eli Perkins, by which the dimensions of the different parts were brought into simple relations to the inch, so that those parts could readily be replaced—a feature only tardily copied by Europe. The result has been to impart to the English inch an international character embodied in real manufactured things and in the tools with which to make those things. This internationality does not apear in ordinary expressions of quantity, but has a real existence, and already rivals the *real* internationality of the centimetre. Ultimately, if we sustain the inch, one or other of two results must be reached: either the real internationality of the inch must gain a clear ascendency, or else the metric countries must be forever stunted in the growth of their manufactures.

Now we are assured by those who are the best qualified to judge of the matter that, were any law to prevent our manufacturers from making things to inch measure, or which should prevent obligatory contracts to do so, the position of our machinery abroad would be irrecoverably surrendered —to England, if she had not already taken a like step; but in any case, would be gone. The understanding under which our machines had been sold, that parts should be replaced, would be dishonored, and we disgraced. Our own country would be flooded with English machinery, unless it were kept out by heavy duties the effect of which would be to bring all our manufactures to the verge of ruin, or further. A large proportion of all the machinery now in the country would have to be thrown away. As for the cost of the change, something may be guessed of it from the fact that the cost of the designs and tools to manufacture a single machine will sometimes amount to nearly a hundred thousand dollars. All this is the best testimony we have.

We know ourselves that the metric system has never been effectually introduced into any country without the aid of penal provisions of a severity entirely unknown to our people; and there has been no people among which they have been more necessary than they would be among ours. Were such measures enacted here, in a few years they would be repealed amid a storm of popular indignation, almost doubling the havoc and confusion, and bringing well-deserved ignominy upon the heads of the doctrinaires whose conceit and pretension had drawn such disaster upon the country; and our universities, where their leaders are, would suffer in consequence.

How are we to estimate the probable amount of this disadvantage in dollars? The only sane way of doing so will be to be guided mainly by a critical consideration of the testimony of those of our great manufacturers who are in the habit of using measurements with real precision, say with errors not greatly exceeding one hundred-thousandth part of the quantity measured. These are the people who make our machinery, etc. For it is certain that their great capital of seven hundred millions cannot be seriously impaired without the injury being felt, first, by all other manufacturers, and soon by every unit of our population. It is no mere theoretical question upon which physicists or other scientists are, as such, competent to lay down the law, but is a practical question of tremendous moment, which practical men best comprehend.

The bill at present before the committee of the House contains two provisions. One of these is that "on and after January 1, 1907, the weights and measures of the metric system shall be the legal standard of weights and measures of and in the United States." We doubt much whether this provision, in the absence of the penal clause usually attached to it in introducing the metric system, amounts to a row of pins. As matters now are, if a court had before it a contract in which a Rhine-inch was mentioned and was defined as 1.03 United States inches, would not that court hold the contract valid? If so, after that enactment, why should not a contract which mentioned an English inch, defining it as 2.54 centimetres, be equally enforced? The contract would express itself in terms of the standards that would be legal "of and in the United States." The other provision of the bill is, that immediately "all the Departments of the Government of the United States, in the transaction of all business requiring the use of weight and measurement, except in completing the survey of the public lands, shall employ and use only the weights and measures of the metric system." In examining all the printed matter put forth by the committee, we have been struck by its avoidance of any explanation of the phrase "employ and use." Does it mean *use in practice* or *use in expression?* If the former, and the bill becomes a law, no chart that expresses depths of water in fathoms can legally be used; if one of our ships should lose a bolt, it can never be supplied, but the vessel must be condemned; the vast collection of designs in the archives of the Navy Department can never be consulted, with a thousand other consequences equally ridiculous. Common sense protests that that cannot be the meaning. Then, the meaning of the phrase "employ and use" must be to *use in expression*. When an inch is meant, it must be called 2.54 centimetres. That would be an innocent provision. But the ambiguity was deliberately intended by those who have been behind the bill. They expect in this way to divide the struggle into two parts, getting the bill passed by quietly representing to those who hesitate to vote for it that it amounts to little more than a requirement that quantities shall be expressed metrically; while, after the bill once becomes a law, they will insist that the inch must really be abandoned, to the endless embarrassment of business in the Departments. They hope to dictate afterward their own interpretation. This should not be allowed. The phrase should be precisely defined in the bill.

The volume before us contains two distinct works. Each contributes something definite, pertinent, and irrefragable to the controversy. In the first, Mr. Halsey shows that the old units are still used a good deal in all the metric countries—*nominally*, even in France; and really, elsewhere. We regret, however, that the author builds too much on this fact, and that, generally speaking, he too much dilutes weighty arguments with others that are almost trivial, if not sometimes downright fallacious. This fault is avoided by Mr. Dale, who, on the positive side, brings forward facts less open to general observation and very instructive, showing that the English inch is "employed and used" in France and throughout Europe, both in practice and in expression in the textile industry, side by side with the centimetre.

Citizenship of the United States. By Frederick Van Dyne, LL.M., Assistant Solicitor of the Department of State of the United States. Rochester, N. Y.: The Lawyers' Coöperative Publishing Co. 1904. Pp. 385.

It is strange that a topic of such fundamental importance as that of American citizenship should have thus far received so little attention from publicists. Of the two books heretofore written on the subject, that of Alexander Porter Morse, which appeared twenty years ago, is an erudite treatise, and still possesses value for special students, but Mr. Morse is a civilian educated at the New Orleans bar, and his point of view is continental rather than Anglo-Saxon; moreover, the American doctrine of citizenship has taken a more defin-

ite shape since he wrote than it had attained in all the years before. To disclose this doctrine clearly and concisely is the object of Mr. Van Dyne's book, which not only is the best on American citizenship which has thus far appeared, but will unquestionably have a strong effect in settling into steady practice decisions of the courts and executive rulings on the question of citizenship.

In his first chapter Mr. Van Dyne treats of citizenship by birth in the United States, and gives a clear exposition of the common-law doctrine which was finally announced to be the American doctrine by the Supreme Court in 1898. Whatever can be said of it, it is, as Mr. Van Dyne unfolds it, simplicity itself. Any one born in the United States, no matter what the nationality of his parents may be, no matter how brief their sojourn in the United States, no matter under what disabilities they themselves may labor in acquiring American citizenship, is, by the mere fact or accident of his birth, a citizen of the United States. Indians not taxed and persons born in foreign embassies and legations in the United States, which, by a fiction of international law, are not territory of the United States, are the only exceptions. This always was the law of the United States, and the Civil Rights Act and Fourteenth Amendment to the Constitution are merely declaratory of the common-law doctrine. But the doctrine that a child's citizenship follows that of his parents has been in the past held by some of the executive departments of the Government, denied by others, and occasionally adhered to by the courts. The result was a strange confusion. For instance, the State Department always held that an American-born Chinaman was entitled to protection while abroad as a native American citizen, but upon his return to an American port the Treasury Department classed him as an alien Chinese, and this was the ground taken by the Government in the test case brought in the Supreme Court. Pending the decision of the Court, the departments adhered to their opposing practices, and, in deciding against the United States, the Court really decided in favor of the practice of one of the Government departments.

In passing from the subject of citizenship by birth in the United States to that of citizenship by birth abroad, of American parents, we go from the common law to the statutes, and simplicity disappears; for if a child born abroad of an American father is, as our statute declares, a citizen of the United States, what is his status in a country which recognizes, just as we do, that mere birth within its boundaries confers citizenship? Undoubtedly, as Mr. Van Dyne shows, such a one is born to a dual allegiance, and two Governments may claim him until he himself can elect his nationality; but the claim of the country in which he is dwelling is the more effective claim of the two.

The second part of Mr. Van Dyne's book treats of citizenship by naturalization, and unravels the subject by citations from the laws, decisions of the courts and international commissions, and rulings of the State Department. Before foreign governments, it appears, we insist that certificates of naturalization issued by courts of the United States shall be accepted as proof of citizenship; but the State Department itself frequently rejects them as having been improvidently granted or fraudulently obtained, and many of them undoubtedly richly deserve rejection. We notice a citation by Mr. Van Dyne of a decision that a court of which the judge is *ex officio* the clerk, is not a court of record in the meaning of the law, and has not the right to naturalize aliens. The probate courts in Ohio answer this description, yet they are the principal courts for naturalization purposes in that State, and thousands of people hold their certificates. We can foresee the confusion which will follow when it shall have been definitely determined that these certificates are void and of no effect.

Mr. Van Dyne shows that a number of invalid certificates of naturalization have at different times been issued to Chinese. The original naturalization law of 1802, upon which our existing laws have been engrafted, provided for admission to citizenship of "free white persons" only, and an amendment in 1870 extended the privilege to "aliens of African nativity, and to persons of African descent." Therefore, Japanese, Burmese, Indians, even some Mexicans, as well as all Chinese, are ineligible to naturalization, which is reserved for Caucasians and negroes exclusively.

In discussing the rights of those who have taken incipient steps towards securing naturalization, or made what is technically termed "the declaration of intention," Mr. Van Dyne establishes the important fact that the policy of this Government has departed from the position taken by Secretary Marcy in the famous Koszta case, leaving it a single instance; and the extreme contention of Mr. Marcy now depends for support upon the peculiar surrounding circumstances, and is not to be considered an enduring declaration of a principle. It will be remembered that Koszta was an Austrian subject who engaged in the Hungarian rebellion of 1848, and escaped by way of Turkey to this country, where he lived two years, and, after making the declaration of intention to become a citizen of the United States, returned to Turkey on business. At Smyrna he was taken into custody by Austrian officials, and put on board an Austrian man-of-war to be carried to Trieste. The captain (Ingraham) of an American man-of-war lying in Turkish waters demanded and secured his release, and in supporting this action Mr. Marcy took the ground that, as Koszta had a domicile in the United States, he was vested with American nationality; but this has given place to the stricter rule, as laid down by Secretary Olney, that "a mere declaration of intention to become a citizen cannot clothe the declarant with any of the international rights of citizenship."

A unique case of resumption of American citizenship by special act of Congress is given in the chapter on "Naturalization by Marriage." Nellie Grant, daughter of Gen. Grant, married Algernon Sartoris, a British subject, and thereby became, in accordance with the universal rule and our naturalization convention with Great Britain, a British subject. Upon her husband's death in 1896, she returned to the United States and petitioned Congress to be readmitted to American citizenship, and, by joint resolution of May 18, 1898, was readmitted. As it has been repeatedly held that "the nationality of origin of an American-born woman reverts upon the death of her alien husband if she is residing in the United States, or upon her returning to this country, if residing abroad," it must be concluded that the act of Congress in this case was unnecessary, and intended as an unusual compliment to a daughter of Gen. Grant. It is the only instance of Congress conferring citizenship upon an individual by name cited by Mr. Van Dyne, and, we believe, in our history.

The chapter on naturalization by treaty is chiefly of historical interest. Residents of Detroit were made citizens of the United States by our treaty of 1794 with Great Britain; of Louisiana by the treaty of 1803 with France; of Florida by the treaty of 1819 with Spain; of portions of Mexico by the treaties of 1848 and 1853 with Mexico; of Alaska by the treaty of 1867 with Russia. The treaty of 1898 with Spain left the status of the inhabitants of the ceded islands to the tender mercies of Congress. Mr. Van Dyne quotes the pertinent parts of the Supreme Court's decision in the case of Downes vs. Bidwell, and, if the chapter is not conclusive, it must be said that the subject itself is not concluded. Filipinos and Porto Ricans now receive under the law the protection of our passports while they are abroad, and are required to take the oath of allegiance to the Constitution of the United States, of which they are not citizens. When a second edition of Mr. Van Dyne's book comes to be printed, it is to be hoped that he will have a more satisfactory condition to chronicle.

The third part of the book is devoted to Passports, and the fourth to Expatriation. As there is no law declaring what constitutes loss of American citizenship, it would appear that the Executive generally contents itself with withdrawing its protection from those whose acts are inconsistent with preservation of domicile in the United States and performance of citizens' duties, without specifically declaring that expatriation has been accomplished.

An appendix gives the laws relating to citizenship and naturalization, and the naturalization conventions between this country and foreign Powers. The index, without being copious, appears to be adequate, and the work is notably free from typographical errors.

The Life of Lord Edward Fitzgerald, 1763-1798. By Ida A. Taylor. Pp. xii, 340. Index, portraits, and illustrations. New York: Brentano's.

Lord Edward Fitzgerald was without doubt one of the best and purest of those who have sacrificed themselves for what they believed to be the good of Ireland. His memory remains a precious possession to his countrymen. Sprung from the best blood of the country, closely related to Charles James Fox, the Napiers, and others of the highest English families, nurtured amidst refined surroundings, the friend of Sheridan and Madame de Genlis, who could have supposed that he would die alone in prison, from a wound received when resisting arrest, and that his remains would be consigned to a damp vault, far from those of his ancestors, in the city of which he and his wife were once the pride and ornament? The story of his life is admirably told by Miss Taylor, and is more absorbing than all but a few novels. She has availed herself of the best materials. The illustrations are

well selected and artistically reproduced, and the work is altogether pleasant to take in hand.

It is as the revolutionist, Leader of the United Irishmen, that Lord Edward is generally thought of. Revolutionary sentiments seriously influenced him for only the last six years of his life, and it was not until within the last three that, like thousands of his fellow-countrymen, hopeless and driven to desperation by the refusal of effective reform, he irrevocably committed himself to armed insurrection. And even to the last he led a double life; those on earth to whom he was most attached, his mother and his wife, being left in ignorance of the extent to which his views had carried him. Many of his early years were spent in France with his brothers and sisters. Thither his mother, the Duchess of Leinster, had retired after a second marriage. It was as an explorer of Canadian wilds, and as an officer fighting against us in the War of Independence, that he first distinguished himself. At the last,

"the comparison of the two objects for which his blood had been shed, would seem to have been present with him; and when a visitor [to him dying in prison] reminded him of those old days, he replied—was it with a sense of a debt wiped out?—that it had been in a different cause that he had been wounded then; since at that time he had been fighting against liberty, now for it."

Never was there greater love between mother and son. Expecting her to visit him in 1786, he writes: "Do not stay too long at Oxford, for if you do I shall die with impatience before you arrive. I can hardly write, I am so happy." Later: "You are, after all, what I love best in the world. I always return to you, and find it is the only love I do not deceive myself in. . . . In thinking over with myself what misfortunes I *could* bear, I found there was one I *could not*—but God bless you." Seven years later, in full enjoyment of a happy marriage, he writes:

"I long for a little walk with you leaning on me, or to have a long talk with you sitting out in some pretty spot, of a fine day, with your long cane in your hand, working at some little weed at your feet, and looking down talking all the time. I won't go on in this way, for I should want to set out directly, and that cannot be."

His marriage to Pamela, then affianced to Sheridan, and possibly but in her sixteenth year, is a romance in itself. Miss Taylor is satisfied that Pamela was really what Madame de Genlis, her guardian, represented her to be, the daughter of a French father and an English mother, born in Newfoundland. Fortunately for himself, Lord Edward was never conscious how little worthy she was to make him permanently happy. As it was, he adored her to the last. Perhaps Irishmen generally would be more friendly to the negro race if they remembered the attachment that existed, during the latter half of Lord Edward's life, between him and one of them—poor Tony, who had found him wounded and senseless on a battlefield in America, who was his companion in all mutations of his fortunes the rest of his days, whose advice he was often glad to take, and whose grief when Lord Edward was "on his keeping" (that is, a hunted man) was that his "unfortunate face" rendered it impossible for him then to be of any real service to his beloved master. We wish Miss Taylor had told us something of Tony's fate after his master's death. How strange the changes brought about by time! Lord Edward's descendant, Mr. Wyndham, is now, under the British Government, virtually governor of Ireland. We rise from a perusal of Lord Edward's life under the impression that, whatever blessings the French Revolution brought to the rest of the world, it exercised an unhappy influence upon the fortunes of Ireland.

If Miss Taylor had studied the history of the war of the rebellion as conscientiously as she has studied that of the last years of the Irish Parliament and of 1798, we should have been spared the unworthy sneer to be found on page 184, concerning the bravery of Northern veterans at the battle of "Gettisburg."

Shelley's Adonais. Edited, with introduction and notes, by W. M. Rossetti and A. O. Prickard. Second Edition. Oxford: Clarendon Press; New York: H. Frowde. 1903.

Thirteen years have passed since the Clarendon Press published the first edition of Mr. Rossetti's commentary on the 'Adonais.' The second edition, which lies before us, possesses a peculiar interest. The appearance of the commentary in 1890 was due to the fact that the poem was part of the prescribed reading for candidates for honors in the School of English Language and Literature then recently constituted at Oxford. The foundation of this school almost ranks as an Oxford "movement," since it signified that one of the great English universities was about to revolutionize its curriculum, and to raise the study of "Literæ Anglicæ" to the level of the "Literæ Humaniores." The specialists in English, who were mainly philologists in the narrower sense, refused to recognize in any way or to admit to their councils the representatives of classical scholarship—an exclusiveness that was bound to weaken their school, seeing that the greater part of English literature is barely intelligible to those who are unacquainted with the classics of Greece and Rome. The provisions of the new school were received with a fire of criticism from classical scholars. Mr. Churton Collins, the spokesman of all serious critics since the death of Matthew Arnold, prophesied that a "herd of imperfectly and erroneously disciplined teachers" would be let loose on England and the colonies, and that the whole level of "liberal instruction and study" would be degraded.

The publication of the 'Adonais' came very opportunely to point his moral. Mr. Rossetti knows nothing of the classics. Yet the Clarendon Press entrusted to him the editing of a poem which is modelled on a Greek elegy, and contains echoes of the dialogues of Plato and numerous adaptations of Æschylus, Euripides, Theocritus and Lucretius. The 'Adonais' has many of the qualities of an Alexandrian poem. It is full of conceits, is not always sincere (Byron, for instance, did not veil "all the lightnings of his song in sorrow"; he wrote an unfeeling epigram on "John Keats who was killed off by one critique"); above all, it is a poem of reminiscences written for a select and highly-educated audience. Mr. Rossetti, however, contented himself with quoting Mr. Andrew Lang's translation of Bion and Moschus, and ignored the other echoes of the classics, as well as some obvious reminiscences of Marlowe and Shakspere. This, then, was the text-book furnished to candidates for English honors by the Clarendon Press, which is a sort of Trust, and can count on its publications being adopted throughout Oxford's sphere of influence. If a scholar had offered to this famous press an edition of a play of Euripides, displaying the feeble erudition of Mr. Rossetti's commentary, he would have been promptly suppressed. But the study of English literature never has been taken seriously in England, and nothing shows that fact more plainly than the readiness of the Clarendon Press to stand sponsor for some of the English text-books that figure in the same list with its admirable editions of the Greek and Latin classics, and the dictionaries and grammars that are standard all over the world.

Mr. Churton Collins fell upon Mr. Rossetti, but the book was not withdrawn, and we now have a second edition which is a complete triumph for the classical scholars who were ignored when the school was organized. For Mr. Rossetti has called in the aid of Mr. A. O. Prickard, the well-known editor of Æschylus, and his name now appears with the original editor's on the title-page. When English specialists are reduced to enlisting classical scholars in this fashion, classical studies are avenged. But Mr. Rossetti and Mr. Prickard together have contributed no more to the new edition than they could glean from the criticism of Mr. Collins. All his parallel passages from classical and other literatures have been incorporated, with no further acknowledgment than the meagre prefatory note which states that "Some reviewers—I may name more especially Mr. Churton Collins—pointed out this requirement," viz., the need of references to classical originals. It would have been more honest to credit Mr. Collins in each case with the score or more of important corrections which have been adopted from his review. The book is now of some practical use to the student, but Mr. Rossetti's rather foolish notes remain. A good example is on stanza 22, where he remarks, on "the snake memory," "Shelley, however, had not the usual feeling of repulsion for snakes and serpents," and proceeds to prove it from the other poems. As a parallel for the "herd-abandoned deer" of stanza 33, he quotes Cowper, and ignores Hamlet's "stricken deer." On page 117, Mr. Collins having failed to point out the mistake, the editor still misquotes a famous line of Keats's "Ode to the Nightingale"; he writes:

"Forlorn! the very word is *as a knell.*"

It is a curious fact that many well-read persons will instinctively give "knell" for "bell" in this line, though there is no variant reading to support their preference. But it was reserved for Mr. Rossetti to make two mistakes in a phrase of three words.

In view of his forebodings as to the degrading effects on England and her colonies if the home-brewed School of English should be allowed to rank with the mellow humanities of a less progressive Oxford, it should reassure Mr. Collins to observe that, in the first four years recorded by the Oxford Calendar, 1897-1901, the total number of candidates for English honors

was only sixteen men and forty-eight women, and the lists show no sign of increase.

Infection and Immunity. By George M. Sternberg, M.D., LL.D. Putnams. 1903.

The ordinary book-buyer would hardly be attracted by this title, although it is that of a popular work in a certain sense. It is a plain, somewhat diffuse, account of how certain serious and common diseases are caused, how some may be prevented and others avoided. It follows ordinary speech in accepting "disease germs" as equivalent to causes of disease; which, to say the least, is unfortunate. Common as it is, "disease germ" is not a happy term. It implies that a disease is a substantive entity, which grows as such. It is not. When we speak of disease germs, false conceptions, unless repelled by conscious effort, fill the mind, for we think in the same terms that we use in speech. But there *are* foreign entities which, having entered the human body, increase in number and sometimes in virulence, whose presence causes the derangements we call disease. They are not the disease; their consequences are the disease. When an investigator has the cholera spirillum under the microscope or in a culture medium, he is not looking at or experimenting with a case of cholera; but a colony of such spirilla will cause cholera, and, properly distributed, an epidemic of it. But, disregarding certain infelicities of expression, by calling attention to the real meaning and to the methods of infection, to the distinction between disinfectants and deodorants, and to the functions of each, to the possibility of absolutely exterminating certain serious diseases, and, speaking generally, by widening popular knowledge in the matter of public health, this little treatise is well adapted, as its author hoped it might be, for use in the higher institutions of secular learning.

If people generally could be made to understand and then to act upon the facts herein set forth, which are merely common property of advanced sanitarians, the mortality from particular diseases would decrease enormously. We should continue to die, but not from consumption, nor diphtheria, nor cholera; and typhoid fever would be as rare as smallpox is in a sane community. But many do not know, and not all of those who may be supposed to have such knowledge act upon it. Take an instance in point from the very text: "Experience shows that new levies of troops are especially subject to typhoid fever and other infectious camp diseases" (p. 134), which is very true and not new. But (*loc. cit.*) on account of the unsanitary conditions in the camps of the newly raised troops for our war with Spain, their typhoid death-rate was twenty-two times that of the regulars in peace. Gross unhealthfulness might easily have been foreseen, especially as the noxiousness of such camps is known to increase out of proportion to their size. Nevertheless, no one made it sufficiently clear to the War Department officials for them to refrain from establishing the enormous conglomerations of Thomas and Alger, where this all came true. The allegation that the annual rate was less by 7.34 per 1,000 than in the Civil War brings small consolation when one remembers that in 1861 the great armies in the field were constantly being reinforced by brigades of raw troops, substantially so much new material for disease, while those of 1898, except the comparatively small number sent across the Pacific, were disbanded in a few months. If intelligent officials having authority failed to exercise foresight or preventive control, we can hardly expect the ordinary citizen (persistent training being lacking) to appreciate the advantages of sanitation, nor, when inconvenient, to practise it.

We might wish that, in the interest of accurate language, the author had recognized its derivation and essential meaning and so have written "ptomaïnes" instead of "ptomaines," for he will surely encourage unlettered speech in those who style these products of decay "ptomanes." But as the diæresis is a contrivance *of* scholars, if not for scholars only, we may expect ptomaïnes to go the popular way of cocaïne. (The makers of aërated bread, we remember, adopted the diphthong Æ as their trademark—a brazen performance, truly.) It would have been better if our author had adhered to one person, instead of sometimes using the first and sometimes the third person. Nor is diffuseness an element of intelligibility. Overlooking such inelegances of style, we have here a practical work prepared from fulness of knowledge and sufficiently plain for easy comprehension. Not only are the scientific nuts cracked, but the shells have been entirely removed. The technical investment has been completely stripped without damage to the contents.

Studies in German Literature in the Nineteenth Century. By John Firman Coar, Professor in Adelphi College. The Macmillan Co. 1903.

It is not easy to formulate the conflicting impressions left in the reader's mind by a perusal of this book. Its theme, the influence of democratic ideals upon the development of German literature in the nineteenth century, is of absorbing interest, and cannot fail to appeal to all who see in literature not the whims and fancies of isolated individuals, but a manifestation of large intellectual and social movements, or, in other words, a part of national life. The present reviewer belongs to this class of readers, and he therefore fully sympathizes with the author's endeavor to show what attitude the foremost German writers of the nineteenth century took towards the public problems of their day, how far and in what manner their works represent the great political, social, and moral conflicts of the last hundred years, to what extent they contributed to making German history. He is, however, aware that, in order to answer questions like these satisfactorily, two fundamental qualities of criticism are required: a large historical perspective and a keen penetration of individual character. Where the former is absent, the popular background of the historical narrative is bound to remain hazy and indistinct; where the latter is lacking, the part played by individual writers cannot be brought out definitely and justly. It is in these two respects that Professor Coar's book fails to fulfil the expectations raised by its programme of inquiry.

The absence, or at least the insufficiency, of historical perspective in this book is illustrated at the outset by a strange parallel in the first chapter between Schiller and a man whom it seems almost invidious to mention in the same breath with the author of "Wallenstein," the hysterical, fantastic playwright Zacharias Werner. The general thesis of this first chapter is that there was no national life in Germany at the beginning of the nineteenth century, that the mass of the people at that time had only provincial or local interests, that the great writers of the period were cosmopolitans, not patriots. Granted that there is some truth in this often-made assertion, it certainly betrays a singular distortion of vision to illustrate this fact by a contrast between Schiller's "Wilhelm Tell," a drama which is declared to be devoid of national feeling and to have been "inspired by purely academic ideals" (whatever they may be), and Werner's melodramatic piece "Martin Luther." In the third act of this play there occurs a scene in which the Emperor, Charles V., in Worms, on his way to the Diet, sees Luther standing in the street among his followers. While he stops his horse and thoughtfully gazes at the young priest, the imperial sceptre falls from his hands, and is picked up by the Elector of Brandenburg. This cheap theatrical trick of a second-rate playwright seems to Professor Coar of greater national import than the noble picture of free manhood given in "Wilhelm Tell," simply because Schiller refrained from making poetry the handmaid of practical politics. "Schiller," he declares, "could not have conceived such an episode as this. . . . Only a Prussian poet, and one feeling the racial unity of the German lands, could at that time have conceived the thought of a united Germany under Prussian lead, and phrased even in such a passing incident the hope of future generations." It is hardly necessary to vindicate Schiller's patriotism against such flimsy remarks as these; but it may be of interest to quote here a few lines from a recently published sketch by Schiller of a poem on Germany, planned a few years before his death, which throw light on the difference between genuine national feeling and party politics. These are Schiller's words:

"Ihm [*i. e.*, to the German] ist das Höchste bestimmt. Und so wie er in der Mitte von Europas Völkern sich befindet, so ist er der Kern der Menschheit. Er ist erwählt von dem Weltgeist, während des Zeitkampfes an dem ewigen Bau der Menschenbildung zu arbeiten. Daher hat er bisher Fremdes sich angeeignet und es in sich bewahrt. Alles, was Schätzbares bei andern Zeiten und Völkern aufkam, hat er aufbewahrt, es ist ihm unverloren, die Schätze von Jahrhunderten.—Jedes Volk hat seinen Tag der Geschichte, doch der Tag des Deutschen ist die Ernte der ganzen Zeit."

Similar doubts as to the correctness of Professor Coar's historical judgments and as to the truthfulness of the historical setting of his narrative force themselves upon the reader throughout the book. By what stretch of imagination can the poetry of Hölderlin, who after 1806 did not write a single line not indicative of his hopeless insanity, be considered as a reflex of public affairs under the Metternich régime? What sense is there in yoking with each other two poets so utterly dissimilar in temperament, artistic character, and public activity as Platen and Raimund, simply because they both died embittered and at

variance with their surroundings? How can Anastasius Grün, whose political poetry antedated the Revolution of 1848 by more than a decade, rightfully be made a representative of this very revolution? What possible meaning can be attached to the characterization of Friedrich Hebbel as representing "the victory of democracy over partisanship"? And, in general, what is the meaning of this word "democracy" which is constantly rung in our ears as the one thing needful, as the one principle whose adoption would bring forth the consummation of poetry? Is it the consciousness of the brotherhood of man? or the belief in parliamentary government? or a pantheistic view of the world? or the striving for social justice? One fails to receive a satisfactory answer to this question, and the result is that the whole intellectual background of the narrative remains obscure, so that one is constantly tempted to apply to this book what Lessing said of the representation of the landscape in Haller's "Die Alpen"; "Ich höre in jedem Worte den arbeitenden Dichter; aber das Ding selbst bin ich weit entfernet zu sehen."

A few words must be said about the second fundamental defect of this book, the indistinctness of literary characterization. To gauge literary achievements by their social importance seems to the present reviewer entirely legitimate; he has himself attempted to do something of this sort. But he believes that the social significance of a work of literature is the composite result of the whole variety of its individual traits, its personal bias, its subject-matter, its artistic form, its religious sentiment, its moral import, its political tendency. Undoubtedly, Professor Coar would subscribe to this view; his book contains sufficient evidence that he has striven for comprehensiveness of treatment. But it seems as if certain preconceived and not fully matured philosophical notions had dimmed his sight and prevented him from seeing each writer first by himself, in his own characteristic outline. As a consequence, the book suffers from a marked monotony and diffuseness, which is further heightened by a strangely vague and at times hopelessly obscure language.

The reviewer has laid emphasis upon these defects of Professor Coar's work, not because he thinks it a poor production, but because he thinks it so good that it deserves to be better. The fact cannot be gainsaid that here we have the first attempt in the English language to trace in detail and from a large point of view the intellectual development of Germany in the nineteenth century; and an author who makes his first appearance with such an attempt may well comfort himself with *in magnis voluisse sat est.* But, quite apart from this consideration, it is refreshing and encouraging in the midst of the endless manufacture of textbooks and manuals by college professors to see here a younger member of the craft start out with a work of pronounced individuality and independence of traditional standards. Whatever exceptions may be taken to this book, it will remain a stepping-stone in the progress of serious literary study in this country. Such noteworthy novelists as Willibald Alexis, Friedrich Spielhagen, Gottfried Keller, such dramatists as Otto Ludwig, Friedrich Hebbel, and Anzengruber, such movements as the Nietzschean revolt against accepted canons of morality and as the naturalistic phase of the contemporary drama, are here for the first time exhibited in their relation to the national development as a whole. This is in itself a service of no small weight; it will undoubtedly bear fruit in the spread in this country of a fuller and juster appreciation of recent German literature. And the book as a whole will, we hope, lead to other books similar in scope, but more careful in execution.

READY.
A Notable Scientific Work.
GEOLOGY
By THOMAS C. CHAMBERLIN and ROLLIN D. SALISBURY,
Heads of the Department of Geology and Geography in the University of Chicago; members of the U. S. Geological Survey.
With twenty-four geological maps in color, three tables giving analyses of lake waters, and numerous illustrations. American Science Series, Advanced Course, Vol. I., Geological processes and their results. xix+654 pages. 8vo, $4 net.
This book presents convincingly a view of the origin of the earth and its present condition, which may lead to serious modifications in the nebular hypothesis. On this, as well as on other grounds, the book appeals to a far wider audience than college instructors. It presents the leading facts of Geology in such a way that the general principles of the science and the main course of geologic history may be clearly understood by the intelligent reader who bas had little previous training in the subject. The elaborate illustrations have taken a long time to prepare. Volume II., which is in preparation, will deal with geologic history.
Henry Holt & Co.

The Most Interesting Book of the Year

AN AUTOBIOGRAPHY BY

HERBERT SPENCER

AN American friend of Spencer who has read the book, says: "It is as broad and many sided as human experience, and the marvel and charm of it is its simple, straightforward and obvious truthfulness. It seems to me to exceed any of his former works in interest and practical value; and I have been a constant reader of his writings from their first publication in this country. Mr. Spencer's supreme loyalty to truth and his native frankness have made his account of his life very open and unreserved. Lest he might err in this direction he got the advice of confidential friends. After reading it and approving it entirely, Huxley remarked that it reminded him of the 'Confessions' of Rousseau, without any of the objectionable features of that work."

With illustrations, many of them from the author's own drawings. 8vo, cloth. 2 vols. In a box, $5.50 *net*. Postage 40 cents additional.

THE MAN ROOSEVELT

A Portrait Sketch

By FRANCIS E. LEUPP

Washington Correspondent of the New York Evening Post

AN unprejudiced personal study of President Roosevelt by one who has known him intimately for twenty-five years as a man and a friend as well as a politician and a statesman. It is written from a thorough knowledge of practical politics, and with all the candor and fearlessness of a trained newspaper man; is rich in anecdote, and contains many bits of hitherto unwritten history. It is a revelation of THE MAN, HIS AIMS, and HIS ACHIEVEMENTS.

Illustrated from photographs. $1.25 *net*. Postage 12 cents additional.

NEW FICTION

THE IMPERIALIST

By MRS. EVERARD COTES (Sarah Jeannette Duncan), author of "An American Girl in London," etc. Illustrated, $1.50.

THE VINEYARD

By JOHN OLIVER HOBBES (Mrs. Craigie), author of "The Gods, Some Mortals, and Lord Wickenham," etc. Illustrated, $1.50.

IN WHICH A WOMAN TELLS THE TRUTH ABOUT HERSELF

12mo, cloth, $1.50.

THE CLOSE OF THE DAY

By FRANK H. SPEARMAN

Author of "The Daughter of a Magnate," etc. 12mo, cloth, $1.25.

DOLLARS AND DEMOCRACY

By SIR PHILIP BURNE-JONES, Bart.

With many illustrations from his own drawings.

A VOLUME of friendly criticism and commendation written out of the author's impressions of American social and public life obtained in his recent sojourn of a year in the United States. A fresh view of ourselves through the eyes of others is always interesting, and in this instance is especially so, coming as it does from one who remained in the United States long enough to write upon observation and not from the chance impression of the hurried traveler.

12mo, cloth, $1.25 *net*. Postage 10 cents additional.

THE MODERN BANK

By AMOS K. FISKE.

A new volume in Appletons' Business Series. The only complete popular treatise on the methods employed by the great banks of the present day.

Illustrated. 12mo, cloth, $1.50 *net*. Postage 12 cents additional.

HOW TO KNOW ORIENTAL RUGS

By MARY B. LANGTON.

A popular treatise at a popular price. Beautifully illustrated. With 12 colored plates, many full-page illustrations in half-tone, and a map of the rug districts.

12mo, cloth, $2.00 *net*. Postage 15 cents additional.

Teachers, etc.

A GRADUATE OF THE MASSA- CHUSETTS Institute of Technology and Ph.D. of the Johns Hopkins University desires to hear of a position for teaching. For the past four years an instructor in chemistry in the medical school of one of the large eastern universities, during the last two of which he has acted as substitute in most of the class work of the professor and had charge of the laboratory courses in chemistry.

Has had also wide experience in sanitary chemistry, especially in positions of responsibility in the chemical and biological examination of water supplies.

GATEWAY SERIES OF
ENGLISH TEXTS
General Editor, HENRY VAN DYKE, Princeton University.
Cloth, 16mo. Eighteen Volumes.

THIS new series, of which four volumes are already issued, will include all the college entrance requirements in English. The books are convenient in form, attractively and substantially bound, reasonable in price, and printed from clear type. Each volume contains a portrait and biography of the author, and an introduction dealing with the subject of the book, the way in which it is written, its relation to human life, and its place in literature. The notes treat of difficulties in the text, allusions and references, and points of construction. The editing of these volumes is carefully and judiciously done. A list of the series will be sent to any address on request.

Spring Educational Numbers

The usual Spring Educational Numbers of The Nation will be issued this year on March 31st and April 7th, and will reach the professors and teachers in all the leading Colleges and Academic Institutions in the country. Four thousand extra copies of each issue will be sent to persons interested in educational affairs in addition to those sent to regular subscribers, and as there will be different lists for each of the special issues, advertisements should be inserted in both of them in order to reach the entire list.

Copy for the first of these numbers should be received by Tuesday, March 29th, and for the second by April 5th.

THE BEST NEW MACMILLAN BOOKS

The History of American Art — Edited by JOHN C. VAN DYKE

The History of American Music

By **LOUIS C. ELSON,** *Musical Editor of the Boston Advertiser*

As in Mr. Taft's "The History of American Sculpture," the book will be illustrated with twelve photogravures and more than one hundred half-tone plates and pictures in the text. This series of books brings together for the first time the materials for a history of American art from colonial times to the present year. Mr. Elson tells of the beginnings, the foreign influences, the changes, the methods, the personal endeavors, that have gone to the making of our present music, and enlivens his book with many personal sketches and apt characterisations.

Imperial 8vo, red cloth, gilt, in a box, $5.00 net (carriage extra)

RECENT FICTION

Second Edition.

The Adventures of Elizabeth in Rügen

By the author of "Elizabeth and Her German Garden," etc. "Merry and wise, clever and lovable, as polished as it is easy . . . it is full of breeze and sunshine, of the glory of land and sea, of the sheer joy of living."—*N. Y. Times.* *Cloth, $1.50*

Mr. EDEN PHILLPOTTS'

The American Prisoner

A STORY OF DARTMOOR IN 1812.

"Head and shoulders above any other book of the month."—*Baltimore Sun.* *Fourth Edition, cloth, $1.50*

Mrs. SARA ANDREW SHAFER'S

The Day Before Yesterday

"Half humorous, half tender, wholly delightful," says the *Philadelphia Ledger* of its subtle understanding of childhood's point of view. *Cloth, $1.50*

Mr. CYRUS TOWNSEND BRADY'S

A Little Traitor to the South

"A Southern love story of genuine and refreshing charm," says the *New York Globe.*

Illustrated in colors by A. D. Rahn, with decorations by C. E. Hooper. Cloth, $1.50

Miss MARGERY WILLIAMS'

The Price of Youth

"An impressive story, finely told, and one feels it all the more because the tragedy of which it tells—the wreck which doubt can cause—is terribly and eternally true."—*N. Y. American.* *Cloth, $1.50*

ONOTO WATANNA'S

Daughters of the Nijo

gives an unusually interesting view of the Imperial court of Japan. By the author of "The Wooing of Wistaria."

Illustrated in colors and decorated by Kiyokichi Sano. Cloth, $1.50

Ready very shortly.

MISCELLANEOUS BOOKS

Just ready.

Letters of Lord Acton to Mary Gladstone

Edited with an Introductory Memoir by HERBERT PAUL. With two plates. *353 pp., 8vo, illustrated, cloth, $3.00 net.*

Sometime President of the Philological Society.

The Making of English

8+245 pp. 16mo, cloth, $1.00 net.

Mrs. HUGH FRASER'S *delightful*

Letters from Japan

Cheaper edition. In one volume.

"Nowhere else do we get so closely into touch with the actual Japanese men and women—yes, and children, too—as in this book."—*The Outlook.*

With all the 250 illustrations of the $7.50 ed. Cloth, $3.00 net.

By A. R. COLQUHOUN

Special Correspondent of the London "Times" in the Far East.

The Mastery of the Pacific

With Maps and illustrations. $3.00 net. (Postage 30c.)

"The most important book on the general subject of the Far East that has been issued." —*Brooklyn Eagle.*

By FREDERICK AUSTIN OGG

Instructor in History, Indiana University

The Opening of the Mississippi

A STRUGGLE FOR SUPREMACY IN THE AMERICAN INTERIOR.

The story of the prolonged diplomatic negotiation in which four nations, Spain, France, England and the United States, were involved. *Cloth, 8vo, $2.00 net. (Postage 22c.)*

By Prof. H. H. HORNE, Ph.D. *Dartmouth College*

The Philosophy of Education

Being the Foundations of Education in the related Natural and Mental Sciences. *Cloth, 12mo, $1.75 net. (Postage 10c.)*

Miss MARGARET SHERWOOD'S *new book.* Decorated and illustrated by SARAH S. STILLWELL.

The Story of King Sylvain and Queen Aimée

A rare contribution to the literature of pure joy; a romance told in quaint, old-time poetic phrases, the tale of two royal lovers who ran away from court into the forest with no fear but a great capacity for delight in the creation of a home in the sunshine by a southern sea.

On NET books ordered from the publishers, carriage is uniformly an extra charge.

THE MACMILLAN COMPANY, Publishers, 66 Fifth Ave., New York

The Nation.

NEW YORK, THURSDAY, MARCH 24, 1904.

The Week.

The Senate has confirmed Leonard Wood as major-general, seven months or more after receiving his nomination from President Roosevelt. During this time, support of Gen. Wood has come from the White House and War Department as urgently as if the fate of the Administration depended upon its favorite's appointment. To save him, Secretary Root frankly assumed the responsibility for the *jai alai* scandal, for the extra-legal actions of the Cuban courts in the Rathbone case, and for other matters for which Gen. Wood was rightly criticised and attacked. But now that confirmation has come, it is neither a certificate of character nor a guarantee of fitness. It indicates that Congress is as indifferent to the honor of the army as it was in 1898, when it approved the unloading upon it of countless "sons of fathers" and broken-down civil-war veterans, and in 1901, when its members were concerned only as to the number of captaincies and lieutenancies each might bag. That Gen. Wood owes his advancement to the personal friendship of two Presidents, rather than to any individual merit, is a fact which a dozen confirmations could not hide; and that he lacks the respect of a vast majority of the officers of the army.

President Schurman, answering the questions of a New Rochelle audience, took firm ground for Philippine independence. "What we have done for Cuba in a short time," he said, "I should like to see done for the Philippines in a reasonably longer time." We regret that no hearer asked, "How long a time?" for that is the point at issue; but one may fairly assume that President Schurman did not mean to postpone the act of liberation for a century or more. It is all-important that we should gain at least some general notion of the outlook for independence. When all is left vague, we have nothing to offer the natives, and we may not justly encourage any expectation on their part. For, if it is true that freedom cannot come before the fourth generation from Aguinaldo, surely we do a great wrong if we hold before the present Filipinos anything but beneficent subjection. On various occasions Gov. Taft has seemed to think that freedom a hundred years hence could be made a heartening prospect to the brown men, and a reassuring one to us at home. But a hundred years probably seems as long in the Archipelago as it does in America.

President Roosevelt's Panama policy has worked havoc with his supporters' sense of humor. Professor Hart of Harvard showed this very strikingly in his recent Cooper Union talk on "The Diplomacy of the Panama Canal." Some one asked him if the treaty of 1846 did not guarantee the sovereignty over the Isthmus to New Granada, and if the United States did not undertake to protect the republic against any effort to overthrow this. The answer was truly astonishing—if it was reported correctly: "The treaty provides for protection by the United States against the invasion of the Isthmus by foreign Powers, but nothing is said about protection against this country." Before ratifying the treaty New Granada should have asked "Quis custodiet ipsos custodes?" According to this view, she had no right to assume that our promise to protect her against foreign nations implied that we should treat her decently ourselves. It was not in the contract that we should not despoil New Granada at will. Therefore, our practical ejection of Colombia from the Isthmus was no violation of our agreement of 1846. In Professor Hart we have a new Daniel come to judgment.

Gov. Odell is to be chairman of the Republican State Committee. Such a possibility has long been discussed, but the decision is now made. Under the most favorable circumstances the Republicans, rent by factional quarrels, are likely to lose the State if conservative Democrats are nominated for President and Governor. This danger is conceded by many of the shrewdest Republican politicians. They admit that they are in dire need of the support of independent voters; they propose to adopt the one course that will drive the independents into the arms of the Democrats. Gov. Odell's behavior has of late sorely tried the better element in all parties; but this gross disregard of official propriety is the last and the unpardonable sin. Many evils attend the plan of having the Governor the party boss, as Odell has been. He is constantly torn by a struggle between his duty to the whole State and his desire to strengthen party machinery. The effect of such a struggle has been very evident in the career of Mr. Odell. His early professions of independence have been one by one abandoned; his pristine vigor of administration, his zeal for economies, have yielded to the pressure of Republican henchmen. Whatever else he has let go, he has been bound to retain his hold on the organization. Such conditions are bad enough; but when he tries to be both chairman and Governor he formally enters upon two absolutely incompatible undertakings. As chairman he is responsible for the conduct of the campaign. He tries to secure the support of various corporate interests, the huge railway systems and the traction companies; he is interested in conciliating this man and that, sacrificing something here, letting down the bars there, grubbing for small bits of patronage, and patching up wretched truces till election is over. This petty and intriguing business is expected of a committee chairman; but it is the last thing in the world to which a Governor should stoop. It is plain that Gov. Odell has cast away his former ambition for a higher elective office.

Gov. Warfield has signed the "Jim Crow" bill passed by the Maryland Legislature, one of the most radical separation laws ever proposed in the South. By the new law, every railway and steamship company—by which is meant ferries principally—is required to provide "Jim Crow" compartments and rigidly enforce the segregation of the races. That the negro has fallen a victim to the political ambitions of the senior Senator from Maryland is plain to be seen. Mr. Gorman has insisted upon making the race issue a political one; and a bill providing for the submission of a constitutional amendment intended to disfranchise all negroes is now awaiting the Governor's action. It is thought, however, that Gov. Warfield will veto this measure. His opposition is not based upon any desire to save the ballot to the negro, but upon his belief that the bill as drawn is too radical in some of its aspects, even from a disfranchiser's point of view. As it is, Maryland and Mississippi must be bracketed as infected States, and Warfield, urged on by Gorman, must be classed as a Governor fallen ill of negrophobia.

The difference between the treatment of Huldah B. Todd, the Delaware postmistress, and of Cornelius Van Cott, the postmaster of New York, is additional proof of President Roosevelt's inconsistency in handling postal troubles. Miss Todd was efficient, and—as the special committee of the National Civil Service Reform League reports—"no general belief (if any) exists among the people of Greenwood," her village, "that she was ever active in politics"; and yet, because she was obnoxious to the reigning Senator, she was, on the flimsiest charges, promptly ordered to the block. Postmaster Van Cott is notoriously inefficient; the relations between his subordinates and the local Republican machine have been a public scandal; the report of Messrs. Conrad and Bonaparte, published just three months

ago, declared: "We find it impossible to doubt that Mr. Heath, Mr. Van Cott, and Mr. Beavers himself all knew the payment of this additional compensation was expressly forbidden by law." Nevertheless, the resolute and unswerving Theodore Roosevelt has puttered for three months over Van Cott, will have still another investigation before taking action on the inspectors' recommendation that Van Cott and ten of his subordinates be asked to resign "for the good of the service." But if Van Cott were not backed by Senators whose favor President Roosevelt covets, his gross misconduct of his office would have warranted his discharge ten times over.

Tuesday's announcement by the Northern Securities directors was a very simple and routine matter, and need hardly have caused the turmoil with which the Stock Exchange greeted it. The highest court has said that the company, having been organized contrary to law, must go out of business, and the directors proceed to make their arrangements to that end. The decree of the Circuit Court, last April, had shown how the dissolution could be effected. After forbidding the Securities Company to vote hereafter, or draw dividends, on the Northern Pacific and Great Northern stock acquired in exchange for Northern Securities shares, the court added that the Northern Securities should be allowed to return, to stockholders of the two railway companies, "any and all shares of stock . . . which said Northern Securities Company may have heretofore received from such stockholders in exchange for its own stock." More specifically, the court concluded:

> "Nothing herein contained shall be construed as prohibiting the Northern Securities Company from making such transfer and assignments of the stock aforesaid to such person or persons as may now be the holders and owners of its own stock originally issued in exchange."

This meant that the Securities Company need not seek out the exact individuals who, in 1901 and afterward, exchanged their Northern Pacific or Great Northern shares for Northern Securities stock. Obviously, an attempt to readjust the matter on such lines would be futile, for Northern Securities shares thus issued have in many instances already changed hands half a dozen times on the open market. The precise *status quo* could not possibly be restored, and the court did not demand that it should. The directors announce that each holder of a share of Northern Securities stock is entitled to Northern Pacific and Great Northern shares in the ratio of the company's total holdings of stock in the two underlying properties. There will no doubt be a season of some bewilderment as to who actually owns the greater interest in the two railways which have regained their independence.

The moral which lies on the surface of Friday's failure in the cotton trade is somewhat trite. All of the byways of commodity speculation are strewn with the wrecks of the Sullys and Leiters and Hutchinsons and Labouisses. Opportunities occur, at intervals, for a speculator with sufficient audacity and sufficient credit—the one is sometimes the consequence of the other—to control by purchase of contracts for delivery all that exists of a given commodity, and sometimes more. If such achievements could be confined to the exchanges, no very great harm would be done. A vast amount of fictitious trading is involved; during this very Sully episode, there have been single days when speculators have bought or sold, on the Cotton Exchange, nearly twice as much cotton as existed in all the markets of the world. What happens to the participants in pure gambling operations of this sort, nobody seriously cares. Unhappily, however, the fortunes of great consuming and manufacturing industries are bound up in this inflated speculation. It was the theory of the anti-option agitators of a decade ago that, by prohibiting purchase and sale of contracts for future delivery of commodities, they could abate such nuisances as that inflicted on the cotton trade this year. What they either blindly or wilfully ignored, however, was that the spinner and the miller are obliged to resort to this very purchase on a "future delivery" basis, in order to organize their own plans for a season's manufacture. Rent, working capital, contracts with consumers of finished goods, and sometimes wages of employees, are arranged on the basis of contracts for the season, and no manufacturer would be safe unless he were at least partially guaranteed future delivery and future price of his raw material. But as the price which he pays to-day is regulated by the prevalent price on the open market, it follows that the legitimate consumer will be harassed, subjected to loss, and sometimes ruined, by such operations as that of Sully and his associates.

Our consul at Rouen sends a gloomy picture of the cotton situation in France. Early this year the spinning syndicate of Normandy decided to reduce its production. In 1903 France exported 75,472,498 pounds of cotton goods, against 78,371,325 in 1902, and 80,834,304 pounds in 1901, and the situation has grown more acute in 1904. The Rouen warehouses have been crowded as a result of the overproduction, while the curtailment of the output of the mills has had a marked effect upon the supply of raw cotton in Continental Europe. According to the *Financial Chronicle*, the amount in sight at the leading centres on the Continent at the close of last week was 743,000 bales, compared with 574,000 bales a year ago, 564,000 bales in 1902, and 472,000 bales in 1901. The effect of high-priced cotton is the same the world over. For some reason final consumers are not freely paying the figures for manufactured goods necessitated by the abnormal quotations on the raw material. It remains to be seen whether it is because they will not, or because they cannot. In this country the orders which the mills are receiving are relatively small, and talk of cutting down is beginning to be heard again in certain quarters. All in all, the outlook is about as confusing as could be imagined. The speculators have led the horse to water, but can they make him drink? Will the real demand for cotton goods in the end justify the quotations on the raw material since last fall?

Mr. Hugh Bell, a leading British ironmaster, talks about "dumping" in the most common sense manner in the *Independent Review*. Discussing the ability of a "dumping" country to produce an article cheaper than it can be made elsewhere, owing to natural advantages and superior skill, he says that, should such superiority really exist, the "sooner we know it, and the more rapidly we seek to withdraw our capital from the industry in question, the better." But before admitting that the industry is hopelessly worsted, it is necessary to be assured on a good many points. The chief bogey used to terrify the timorous Briton is American competition. In this matter Mr. Bell does not take us quite as seriously as some of his countrymen do. Indeed, he seems to think that we are more or less troubled with megalomania, or, as he less elegantly phrases it, "swelled head." And to make this clear, he cites the chauvinistic talk of certain of our "captains of industry" before the Industrial Commission. The statement of Mr. Guthrie, of the American Steel Hoop Company, that "the Creator of all things has been good to us" in the matter of raw materials and an intelligent population, in connection with the remark that "we think we have pretty good directors," causes him to ask a pertinent question. If it is true that this country is convinced it can put the leading old-world markets out of business, why have American firms been establishing industrial plants in Great Britain? And why do American millions flow into the construction of underground railways in London, if shortly London is to dwindle to an inconsiderable village?

But supposing it is true that Great Britain is worsted in the struggle for any one market, does it not follow that she will still find an outlet for her products? Mr. Bell figures the total annual income of the United Kingdom at £1,900,000,000, or about $9,500,000,000. Call it £5,000,000 a day, he says, and we

shall not be far wrong. What advantage will come to America and Germany, it is asked, from destroying Great Britain's trade? If they succeed, "this machine that is earning $25,000,000 a day will have gone." Is it not clear that the real interest of both countries is to encourage Great Britain to buy their commodities in increasing amounts? But, of course, if she buys, she can do so only by selling. It should be noted that, if America and Germany should destroy British trade, they would lose not only the profit which they now derive from selling their goods to her, but, by losing the chance to sell to her any longer, would greatly dislocate their own industries and deprive vast numbers of their population of employment. Meanwhile, Mr. Bell argues, England would still be full of men desiring the necessities and luxuries of life, and willing to pay for them by their physical or mental toil. She would have to find people to take her goods in exchange, and he sees no reason why this should not actually be accomplished. In short, he scouts the prevalent theory that there is not enough trade in the world to go round, and that consequently each nation must push and struggle to get its share, "lest it is all appropriated before we seize our part."

It is reported that the German Steel Syndicate is about to open negotiations with the British and American manufacturers for a delimitation of their respective spheres of action in the world's markets. The syndicate has been under contemplation for nearly a year, but it was only recently that an organization was effected. It is to have control until June 30, 1907, and it takes the place of a number of previous organizations looking to a community of interest in the iron and steel industries. Of the twenty-eight establishments originally mentioned in connection with the proposed Trust, all but two large companies had, at last accounts, decided to take part in the deal; so that, as combines go, the German Steel Syndicate may be said to represent more than an average degree of unanimity among producers. Its formation denotes the extent to which competition was carried in the recent boom period in this country and Europe. It also indicates that the German manufacturers have not only ceased to feel the alarm which they were expressing not long ago over the "American peril," but are prepared to carry the war into Africa. This is the logical outcome of the industrial developments of recent years. The situation has at last progressed beyond the establishment of national Trusts. It has entered the international stage. The German Trust is pitted against the American Trust, and the need of some sort of agreement between them is beginning to be keenly felt.

On Monday the British Government was solemnly absolved, in both houses, from any blame in connection with the Transvaal Chinese Labor act. The new slavery was approved by a strictly party vote, though a handful of Unionists refused to support the compound system, and Major Seeley, who had served in South Africa, accompanied his dissenting vote with the announcement of his resignation as a Unionist member. Such an action indicates the kind of moral indignation that the labor bill has aroused, even in Government circles. Besides the natural repugnance to any system of forced contract labor, there is an uneasy feeling that it is almost impossible to throw the promised safeguards about the coolie traffic. Lord Milner's memoranda abound in criticism of the details of the act; the Liberals point to appalling percentages of mortality in existing compounds. Meanwhile, the Government has nothing better to say than that the Cape has decided that the mines must be worked. The very sensitiveness of the Ministry is proof enough to the country that, for the sake of the Transvaal gold, it is getting into dirty business. That instinct will damage Mr. Balfour seriously; against it perfunctory majorities like that of Monday are of little political weight.

Another protest by Austria and Russia against the obstacles raised to the reform of the Turkish gendarmerie fully bears out the apprehensions of those who have utterly distrusted the Mürzsteg plan. It was always absurd to imagine that European officers could control the troops of the Sultan unless some power were at hand to protect these officers against their own troops. In other words, no reform of the Macedonian region which does not take it out of the Sultan's jurisdiction is of any worth. The English Balkan Committee has pronounced definitely for a Governor-General holding directly from the European Concert. Unless that be done, we may expect a renewal of the horrors of last year. Intermittently, so far as winter has permitted, the Turks have continued the proscription, and the time is approaching for the revolutionary komitajis to reassemble. The dissatisfaction of Russia and Austria is natural and very significant; for they of all the Powers should be bound to optimism. But it is clear that the Balkan situation is beyond their power to settle. For a year or more they have acted as the accredited agents of civilization in the Balkans, and have accomplished nothing. It is time their unprofitable stewardship were vacated in favor of stronger hearts and hands.

The war-time elections in Japan have resulted in a marked decrease of the Constitutional Political Association (*Seiyu-kai*), and in a greater increase of the Independents. In a lower House of three hundred, one hundred new members have been returned. The *Seiyu-kai* remains the largest political group at 134, against 187 in the former Diet, while the Independents have virtually the same strength, 132, against a former 59. This noteworthy gain has been made at the expense of the *Seiyu-kai* and the Progressives. The return of so many Independent members is due partly to disgust with the corruption of the politicians making up the *Seiyu-kai*, but, even more, to the new impetus to patriotism brought about by the war. For the Independents are conservative as regards maintaining all Japanese traditions, while the *Seiyu-kai* is the commercial party and committed more or less to imitation of Western methods. This party has naturally lost its favorite issue of administrative economy, since the war has made the raising of revenue not a matter of debate, but of compulsion. So the issue of retrenchment on which the Katsura Cabinet was bitterly opposed is suspended for the present, and the Imperial Diet relapses into a congeries of groups which the war spirit will undoubtedly hold together for a time.

The plans of the Japanese Government for financing the war have been made public. They contemplate allowing $290,000,000 for this purpose, including $20,000,000 special reserve. Of this amount, $230,000,000 is to be obtained from loans, $35,000,000 from increased taxation, and the remainder from the surplus revenue. The Cabinet has submitted proposals to a special Diet now in session, favoring an extension of the tobacco monopoly so as to include the manufactured product, and the creation of a salt monopoly. This plan will involve a heavy expenditure for the purchase of private tobacco-manufacturing concerns. The Cabinet suggests increased taxes on land, incomes, business, wine, sugar, soy, stock exchanges, mining, customs, and stamps, and new ones are created on silk, piece goods, kerosene, and woollens, the estimated total being $34,000,000. The cost of the war to the end of March is placed at $78,000,000, and it is estimated that from then to the end of the year $190,000,000 will be required, besides a special war reserve of $20,000,000. The proposed loans will probably be issued under the imperial ordinance of December 29, sanctioning short-time issues. The same ordinance authorized the Government to draw freely upon all funds in the Treasury's special account, but these funds must eventually be restored. In other words, Japan has been able to find cash with which to begin the war, but is now confronted with the serious problem of obtaining the means to carry it on.

THE PENSION INIQUITY.

No Service Pension bill will be passed by Congress—so it was officially announced from Washington on Thursday. But this did not mean that a courageous and high-minded President had resolutely thrown down the gauntlet to the Grand Army mendicants, and to those truckling politicians of his own party who would once more buy the votes of veterans at the outset of a Presidential campaign. On the contrary, it proclaimed a shameful surrender. The "necessity" for a service pension bill has been averted "by a change in the administration of existing law." In other words, both Congress and the country having shown plainly enough that they did not care to have further pension laws placed upon the statute-books, the same end has been attained by an unexampled perversion of the existing pension rules. The President, through his Commissioner, has presumed to read into them a construction which Congress never intended to allow, and thus is enabled to give notice that hereafter every veteran over sixty-two years of age will be pensioned.

The act of June 27, 1890, allotted to all veterans of ninety days' service who were wholly or partly disabled from self-support a pension of from six to twelve dollars, proportioned to such disability. Of this "due proof" was required. The act was vague and absurd. To apply it at all, the Executive interpreted it in a manner of very doubtful legality. Applicants of sixty-five years were assumed to be entitled to the minor pension of $6 per month, applicants of seventy-five to the major pension of $12. By the simple expedient of lowering the age of disability to sixty-two, all Civil War veterans are now taken in. The original ruling was a discreditable subterfuge. Mr. Roosevelt's modification of it is outrageous, for the presentation of a certificate of age cannot fairly be regarded as "due proof" of anything but age.

In itself a service pension is demoralizing enough. It in no way distinguishes between the worthless bummer who skulked when his regiment fought, and the brave soldier who served on the great battlefields. It does not differentiate between the veteran of a dozen campaigns and the ninety-day soldier who passed his time in a recruiting camp, any more than it does between the millionaire and the day laborer, the physically vigorous and the physically incapacitated. To every man who served ninety days and has passed his sixty-second birthday, Mr. Ware says, "Step up to our pension counter and help yourself; there is no physical examination, and no inquiry as to the value or character of your service."

Scandalous as all this is, the shocking feature of the new ruling is the way the Executive has thereby usurped the function of Congress. At no time has the national legislature openly declared for a service pension for veterans of the civil war. The mere introduction of Mr. Sulloway's bill on January 27 was sufficient to bring out such a chorus of protests from all newspapers which recognized the seriousness of this year's raid upon the Treasury, that there was a prompt change of opinion among the Republican leaders in regard to its advisability. It was not considered possible that in this emergency Mr. Roosevelt would uphold the hands of the pension-grabbers, or that he would do so by reading into laws passed years ago the present intentions of his party leaders in their anxiety for votes. His willingness to abuse his undoubted right to interpret the statutes of Congress is another sign of what has been termed his "lawlessness of mind," clearly illustrated in his unwarranted use of Government vessels for the pleasure of himself and his family, and in the whole conduct of the Panama intrigue.

In defence of his revolutionary order Mr. Ware avers that it will save the Government a good deal of time and money by doing away with hundreds of thousands of examinations. Just as if that very abolition of tests did not throw the doors open to the unworthy! What is the cost of examinations compared to the demoralizing effect upon the people of seeing unworthy men feeding at the public trough? But Mr. Ware attempts to justify the wholesale pensioning by analogy with the treatment of the Mexican war survivors. "It would seem," he says, according to the *Tribune*, "that if, thirty-nine years after the expiration of service, a Mexican war soldier was entitled to a pension at sixty-two years, . . . to soldiers of the civil war, who fought vastly more and longer, at least as good a rule ought to apply." The sophistry of all this is evident. Because Congress was, by due process of law, over-liberal to veterans of our attack upon Mexico, is any soldier of any other war "entitled" to a like liberality without law? If he is, we may look in 1937 for a service pension for all our Spanish war veterans, 22 per cent. of whom have already applied for aid.

But a service pension through an arbitrary bureau ruling will no more satisfy the Grand Army or the pension attorneys than will any of the other concessions which have from time to time been made to the pension-grabbers. For a year or so they may rest content. Then will come the demand for a minimum of $10 or $12 where $6 is now granted. Never before has so insolent a pension demand upon the Treasury been so quickly complied with. It took the Grand Army until last summer to nerve itself to this step. If President and Congress are so compliant and statutes so readily stretched, why stop now? Have not the veterans the right to feel that they own the Government and can bend it to their will? When the Dependent Pension bill of 1890 was passed we predicted that it would lead up to a service pension law, but the suggestion was ridiculed as the vision of a pessimist. But where is the line to be drawn? A conservative estimate of the cost of the Sulloway bill put it at more than fifty millions. Now the public is assured, precisely as if it had not a grain of common sense, that the same expenditure made by administrative order will cost only two or three or five millions a year.

A Senate inquiry into the executive order was inevitable. The Washington correspondents speak of "consternation" among the Republican Senators, who are not overscrupulous after the fashion of whimpering Mugwumps. When they question the President it is not for any ordinary stretching of his powers; the very form of the challenge suggests the iniquity it searches out. "How much will it cost?" the Senate asks. Never before, we believe, has a President presumed to give away millions of the public moneys without a line in the statutes which clearly justifies that expenditure.

POLYGAMY MANDATORY.

No clear understanding of the attitude of the Mormon Church of to-day, as exhibited in its effort to place one of its leaders in the United States Senate, and in the testimony given before the Senate committee at Washington, can be had without a knowledge of the actual relation which the doctrine of polygamy bears to the Church. President Smith, in his recent testimony, stated that the doctrine was merely permissive, not mandatory, and this is probably the general impression. The truth is, however, that the doctrine is as obligatory as any other Mormon doctrine, and it is because of this that the Church has made, and is still making, so desperate a fight to prevent any action which will render the practice of polygamy actually impossible. The obligatory character of polygamy was set forth in unmistakable language in the "revelation" which made known the doctrine to the Church and has been taught ever since. The language used in the "revelation" is as follows:

> "For, behold! I reveal to you a new and everlasting covenant; and if ye abide not that covenant, then are ye damned; for no one can reject this covenant and be permitted to enter my glory. . . . He that receiveth a fulness thereof must and shall abide the law, or he shall be damned, saith the Lord God."

The Mormon leaders made no concealment of their acceptance of the obligatory character of this "revelation" up to the day of Woodruff's manifesto. Orson Pratt, who was selected to make the open announcement of the doctrine to the Church in Utah, emphasized the language of the "revelation." "Now let me inquire," said he to the conference,

"what will become of those individuals who have this law taught unto them in plainness, if they reject it. I will tell you: They will be damned, saith the Lord, in the revelation he hath given us. Why? Because where much is given, much is required."

When Schuyler Colfax visited Utah, after the civil war, he had a formal interview with Brigham Young on the subject of polygamy, hoping to get the credit of effecting its abolition. He proposed to Young that the Church obtain a later revelation doing away with the practice without Federal interference, just as some of the slave States had abolished slavery of their own accord. But the Church retorted in its official organ:

"As a people we view every revelation from the Lord as sacred. Polygamy was not of our seeking. It came to us from heaven, and we recognized it, and still do, the voice of Him whose right it is, not only to teach us, but to dictate and teach all men. Gentiles talk of revelations given and of receiving counter revelations to forbid what has been commanded, as if man was the sole author, originator, and designer of them. Do they wish to brand a whole people with the foul stigma of hypocrisy?"

Brigham Young, on the same occasion, condemning a proposition of some of the flock to drop Smith as a prophet and to lay out a new course, was quite as emphatic: "What I have received from the Lord I have received by Joseph Smith. If I drop him, I must drop these principles."

In 1885, some years after the enactment of the Edmunds law, and when the leaders were defying that enactment in every possible way, the Church restated its position in one of the formal "epistles" that are addressed to the flock from time to time, using this emphatic language:

"We did not reveal celestial marriage. We cannot withdraw or renounce it. God revealed it, and He has promised to maintain it, and to bless those who obey it. Whatever fate, then, may threaten us, there is but one course for men of God to take —that is, to keep inviolate the holy covenants they have made in the presence of God and angels. . . . We may say, however, that if any man or woman expects to enter into the celestial kingdom of our God without making sacrifices, and without being tested to the very uttermost, they have not understood the Gospel."

Woodruff's manifesto was wrung from the Church when it was realized that further open defiance of the law meant the loss of all the rights of citizenship, and when, on the other hand, some form of acquiescence in a different order of things promised Statehood, and with it that freedom from legal interference with polygamy that has been enjoyed in Utah as a State. But that famous manifesto was in no sense a retraction of the former principles underlying the doctrine of polygamy. It began by declaring, "in the most solemn manner," that the statement of the Utah Commission, in their last report, that plural marriages were still solemnized in Utah was false—a declaration which the Commission met in their next report with the reply that they restated the fact, and added that "three additional cases were reported a few days after the report was formulated." The manifesto next set forth Woodruff's intention to submit to the laws of Congress, and closed as follows: "There is nothing in my teaching to the Church, or in those of my associates, during the time specified [the past year] which can be reasonably construed to inculcate or encourage polygamy; and when any elder of the Church has used language which appeared to convey such teaching he has been promptly reproved. And I now publicly declare that my advice to the Latter-Day Saints is to refrain from contracting any marriage forbidden by the laws of the land."

The interpretation of this manifesto by the heads of the Church has been made clear by the investigation in progress in Washington. Their avowals show to their flock that Smith's command in regard to polygamy is still piously observed just so far as it is safe to do so. They are simply holding out to all the members of the flock the hope that the time will come when all may escape damnation by obeying the command. It is this historical light on Mormonism which has convinced many students of the subject that the deadliest blow that can be given to the system will be the adoption of a Constitutional amendment declaring polygamy to be a crime to be dealt with by the Federal courts, thus taking it from the jurisdiction of Mormon State juries. This, it is argued, will put an end to the practice, and compel the Church to drop the doctrine or to remove to a new field where it can be taught and carried out unchecked.

PRESIDENT ELIOT AT SEVENTY.

"Nature's patient ways shame hasty little man," a sentence from one of President Eliot's lectures, is the keynote to much of his work, for he has made nature's patient ways his own. He celebrated on Sunday his seventieth birthday, and this year also marks the thirty-fifth anniversary of his presidency of Harvard. For an estimate of his achievements this is neither the place nor the time: the limits of an editorial article are too narrow, and his labors are, we trust, far from an end. *Serus in cœlum redeat.* But we add our hearty congratulations to those of Harvard graduates, friends of learning from all colleges and schools, and worthy citizens in every walk of life; and we seize this moment as suitable for dwelling on two or three aspects of President Eliot's career. He stands among the foremost citizens of the United States; were there a common denominator by which one could measure men of widely different talents and callings, he might rank the very first. This success is indubitably due in large part to a power which has wrought, like the force of a glacier, without haste and without rest.

It is as an educator that he enjoys the widest fame. For more than a third of a century—a period of unexampled material progress—in a country which has leaped forward rather than developed, he has been at the head of our oldest and richest university. He has thus enjoyed a unique opportunity to set his stamp upon the educational system of a nation; and this opportunity he has employed to the uttermost. The principles which he intended to follow he laid down with precision in his Inaugural Address in 1869; from those principles he has never swerved. He declared: "This university recognizes no real antagonism between literature and science, and consents to no such narrow alternatives as mathematics or classics, science or metaphysics. We would have them all, and at their best." Against the old hard and fast curriculum—"one primer, one catechism, one rod for all children" —he set his face unflinchingly, and proceeded to build up the elective system, which at Harvard already rested on a firm foundation. The opposition within his faculty and without was determined, sometimes bitter. His theory that "a well-instructed youth of eighteen can select for himself—not for any other boy, or for the fictitious universal boy, but for himself alone—a better course of study than any college faculty, or any wise man who does not know him and his ancestors and his previous life, can possibly select for him"—this theory was assailed and ridiculed as individualism run mad. But President Eliot held to his course, and he has seen his theory accepted in every important college of the country. He has weathered the storm that raged about him twenty years ago, and has anchored in the desired haven.

As champion of a movement which put sciences and modern languages in "fair competition" with the classics, he has urged unceasingly more skilful instruction in these new subjects. In his Inaugural, he bluntly told the "scientific scoffers at gerund-grinding" that "the prevailing methods of teaching science, the world over, are less intelligent than the methods of teaching language." Experimentation in the laboratory, original investigation, drill in accurate observation, he has made the burden of many addresses and reports. Moreover, it is owing largely to his efforts that the standard of professional schools has been raised, and that secondary and grammar schools are now reorganizing their programmes according to the modern idea of developing the aptitudes of the individual. But it is upon English that he has laid the greatest stress. He began his presidency by quoting Locke's complaint as to the neglect of the mother-tongue,

and he has returned to the theme again and again. At Harvard he has built up an English department that has been a stimulus to every other college and to schools of all grades.

In this vast enterprise, President Eliot himself, the moving spirit, has had neither the authority nor the will to force the action of faculties or committees. More than once he has seen his opinions thrown into the arena of open debate and voted down. But, convinced that his views, if sound, will ultimately triumph, he has waited with Olympian calm for the march of events. Though the immediate effect of the changes has in some cases seemed to be chaos, he has never been discouraged; he has known that, to rearrange a curriculum, to train competent instructors in new subjects, to establish traditions of mental discipline, will be the task of generations yet to come.

In his discussion of public questions he has insisted upon the right of the individual to attain his highest intellectual and moral development, unchecked by a cast-iron regimen of studies or by intolerance in church or state. His criticisms of organized labor have expressed the conviction of our sanest publicists, that "democracy must profoundly distrust the labor union's too frequent effort to restrict the efficiency and the output of the individual workman." This doctrine of individualism, a tenet of the liberals of the old school, is falling into temporary decay; it is opposed by certain captains of industry who want to crush out the individual and pile merger upon merger; it is opposed by the trade unionists, who condemn all laborers to the lock-step; yet President Eliot has steadily, with candor and courage, striven for the basic principle of our Declaration of Independence.

These are the achievements, these the qualities, that have won him, year by year, a wider recognition; have transmuted cold respect into affection. In the earlier days of his presidency a reserve of manner, absorption in details of administration, and a frank indifference to the gusts of undergraduate sentiment made students regard him with an uncomfortable awe, as if he were a sort of Iron Chancellor in an empire of education, or—to recur to a former comparison—as if he were really a glacier. Time has proved the falsity of this first impression; has shown that no college president has endured with more serenity and good humor the criticism of his colleagues; that the springs of his kindness are as unfailing as the waters that melt from the eternal ice. He has reached the goal of his ambition. In describing Dr. Asa Gray's life as "happy," he declared: "It is the greatest of human rewards to be enfolded, as years advance, in an atmosphere of honor, gratitude, and love." That greatest of rewards President Eliot himself has reaped in full measure, while his eye is not dim nor his natural force abated.

RUSSIA AND THE JEWS.

Russian statesmen are reported to be puzzled over the surprising unanimity with which the bulk of the American people has given its sympathies to the Japanese in the war in the East. Have we not, they ask, been friendly to the United States at all times, and particularly during its period of storm and stress? And are we not Christians, battling with pagans whose reputation for honesty and trustworthiness is below that of the Chinese? Have we not stood for international peace and comity? To these questions there are many possible replies. We will confine ourselves to one. Russia is the only country which to-day excludes American-born citizens solely because of their religious belief. Be a Jew ever so worthy, be he well educated, philanthropic, a power in the financial or industrial world, he is still forbidden to cross the Russian boundaries without special permission, even if he would travel merely for pleasure and information. To any one of the Hebrew faith applying for a passport the State Department has a stereotyped reply, one clause of which reads as follows:

> "The laws of Russia also exclude from Russian territory, except by special permission, all people of Jewish faith, and while this Government has been endeavoring for some years past to secure a relaxation of this enactment, it is only proper to warn those who are within the category to which they refer, that it has not yet been able to secure from the Russian Government a promise of uniform treatment for all American travellers in Russia without regard to their religious faith or place of birth."

As if this were not humiliating enough for a Government which prides itself on the protection it extends to its citizens resident in China and less civilized quarters of the globe, the State Department must confess that even the "special permission" to which it refers is no bar to insult and ill-treatment after the Russian border has once been crossed.

As for the Russian-born Hebrew, he is, in one respect, on the same footing with men of other faiths born subjects of the Czar. Unless that ruler's permission is obtained, any Russian citizen who becomes a citizen of another country is liable under Russian law to the loss of all his civil rights and to perpetual banishment from the Empire; and he cannot apply for a permit to emigrate unless he has completed his military service. Should he return to visit his kindred, he faces deportation to Siberia, even if he left his native land before reaching the age of conscription. It is this which explains the presence among us of thousands of unnaturalized Finns who, dearly as they would like to become citizens of their adopted country, cannot pay the price of permanent separation from their relatives and friends in Finland which such a step would entail.

In other respects the treatment of the Russian Hebrew who has sought freer climes is much harsher than those of different religious beliefs. He must apply directly to the Russian Ministry of the Interior for permission to reënter Russia, and the State Department will not act as an intermediary for him. Rare are the cases in which a naturalized Hebrew can obtain the consent of the Minister of the Interior. His business relations with Russia may be of such importance as to require frequent visits to St. Petersburg or Moscow, but generally neither this plea nor any other avails him. The truth is, that the Russian Government looks upon its Jews as persons who are only to be tolerated when they are not massacred. They are neither citizens nor free men in the sense that they may pass freely from one occupation to another and live where they choose. Even their habitations are assigned to them, as to the morally unclean. The very extent to which the Jew may have his children educated is fixed by the autocratic Government above him; and if he sends his sons and daughters to study at foreign universities, they are subject to Russian espionage, and—as was the case in Berlin last week—are liable to expulsion even from the foreign country, if they protest against the spies who dog their footsteps while they seek the knowledge denied to no one in this country.

With Russia's treatment of its own within its borders, the United States, as a nation, can have, of course, no active concern. To such as would escape persecution and oppression our doors are open, and will, we trust, remain so. But with Russia's behavior towards naturalized or native-born American citizens within its borders, we are directly concerned. In 1832 a treaty was concluded between the two countries, the very first article of which stated that "there shall be between the territories of the high contracting parties a reciprocal liberty of commerce and navigation. The inhabitants of their respective States shall mutually have liberty to enter the ports, places, and rivers of the territories of each party wherever foreign commerce is permitted. They shall be at liberty to sojourn and reside in all parts whatsoever of said territories, in order to attend to their affairs, and they shall enjoy to that effect the same security and protection as natives of the country wherein they reside." This solemn guarantee has been persistently and deliberately violated, solely because of religious intolerance and racial hatred. The State Department not only confesses the fact, but admits that it has never been able to induce Russia to negotiate a treaty which should treat in detail of the rights of

American citizens of Russian birth on their return to their native land. Here is a great opportunity for Mr. Hay's skilful diplomacy to add one more to his long list of triumphs; and for Russia to soften the prevailing anti-Russian spirit in this country by respecting the treaty she so steadily ignores.

THE MIDDLE STATES CONVENTION OF HISTORY TEACHERS.

PHILADELPHIA, March 17, 1904.

The second annual convention of the Association of History Teachers of the Middle States and Maryland was held in Philadelphia on March 11 and 12. The Association was organized in 1901 as the result of a conference of those interested in the study and teaching of history, and its first regular meeting was held at Columbia University in 1903. As far back as 1883 the first coöperative attempt had been made to improve the teaching of history in America through the efforts of President (then Professor) G. Stanley Hall. In undertaking the editorship of a pedagogical library, he stated that history was chosen for the subject of the initial volume because, after much observation in the schoolrooms of many of the larger cities in the Eastern part of the country, he was convinced that no subject so widely taught was, on the whole, taught so poorly. The volume published comprised a translation of Diesterweg's 'Methods of Teaching History,' with additional chapters contributed by six distinguished university professors or writers of history. As a pioneer essay it is entitled to lasting memory, even though it is half forgotten and it is at least a question whether any of the contributing writers would to-day give the same content to his article as that which he gave it twenty-one years ago. In the wake of it came the conference of the Committee of Ten at the University of Wisconsin eleven years ago, the consequent Columbia conference, and the appointment of the Committee of Seven. It has been the interest in history awakened in part by the reports of these and other committees that has led to the association of the history teachers of New England and of the North Central States, of Nebraska, California, of Indiana, of Chicago, and of New York city.

What have been the fruits of these past years of united work? A consistent, logical course in history has been planned for the secondary schools, and has been already widely adopted. In place of detached, isolated courses given haphazard in unchronological order, we have a course based on the theory that history is the study of development. A natural result of this has been the practical adoption of uniform requirements for admission to college, and this in turn has made possible the adoption of the system of uniform entrance examination questions. Thus history has been accorded a permanent place in the curriculum, and if the classicists and scientists could but realize that history does not supplant the older subjects, but serves as a unifying force to make the curriculum an organic whole, a more hearty welcome would be given the newcomer.

What remains to be done? One of the most important duties would seem to be, to press on the attention of those having the appointing power, that an essential qualification of those whom they select to teach history should be some knowledge of the subject to be taught. The protest against present conditions is not superfluous; current announcements show that one ambitious school, in one of the most famous New England towns, has a teacher who gives instruction in music, painting, drawing, biology, and history; that in one large city high school the classes in history are heard by the musical critic of one of the daily papers; that, in another, history has been assigned to the general-utility man. A second line of work that needs to be taken up is a consideration of the relation between a consistent course of history in the general secondary schools and that given in college preparatory schools. A large number of schools now have a well-arranged course in history, yet this is made of no effect for its college preparatory class, through the increase in the language requirements made by the colleges, and the regulation requiring all college entrance examinations to be taken within two years prior to admission to college. The schools cannot square the circle—they cannot give a course in ancient history during the first year in the high school, where it logically comes, and yet have the work examined by the colleges within two years of entrance. No better service could be rendered the cause of historical teaching than a presentation to colleges and schools of a satisfactory solution of this very real difficulty.

Ample justification for the formation of another association would seem to be found equally in what has already been accomplished through coöperative effort and in what yet remains to be done. But if there had been any lingering doubts on the part of any one, they must have been dispelled by the success of the recent meeting. The three sessions held appealed alike to college professors of history, to historians and investigators, and to the teachers of history in the secondary schools. The great problems which confront the college professor of history concern the amount and kind of historical instruction that students have had before entering college, the articulation of his own work with this, the nature of the courses required of college students, and the adaptation of advanced to elementary college work, since the college professor must believe that "advanced work in history does not mean studying larger books and more of them." Several of these questions were discussed by Prof. C. H. Haskins in a masterly paper on "The Historical Curriculum in Colleges." It was based on an extended study of the history course, whether required of all students or as a prerequisite to other history courses, and showed that while the greatest diversity existed in the universities and colleges of the country, the various required courses were practically reducible to three types—those covering the entire field of general European history, a second type dealing with the history of a single country (usually England or America), and a third, practically a course in mediæval history. The conclusion reached was that, under present conditions, the third type had the weightiest arguments in its favor.

The specific question of what should be the college entrance requirement in history had been dealt with by a committee whose report was presented by President Austin Scott. The great value of this report consisted in its fresh, original suggestions for a rearrangement of the subject-matter treated in a four-years' high school course. Thus, it would be possible to gain time for Oriental history if the dreary periods of civil strife, both in Greece and in Rome, could be eliminated from the work. Further suggestions included that of closing the year given to mediæval and modern history with the Treaty of Utrecht, and merging the two years given to English and American history into one year of study of the history of the English people from the time of their settlement on English soil, in the fifth century, to their control of the English-speaking world to-day; and a fourth suggestion was made that the year thus gained be given to modern history from the time of the Seven Years' War.

The specific question of the articulation of work in history in colleges and secondary schools was admirably discussed by Dr. James Sullivan, in an exhaustive paper showing that, as far as the present curricula and methods both in schools and in colleges are concerned, there is at present no general articulation. To make such possible, it would be necessary to have an ideal curriculum worked out for the colleges, and to have the question of methods, both in school and in college, thoroughly investigated with a view to making the transition from school to college less abrupt. The following propositions were advanced suggestively as a basis for future study and discussion: That a book commonly used as a text-book in a secondary school should not be used as a text in college; that elementary work in the colleges should show a proper advance over the advanced work in the schools, both as to texts used and as to time required in and out of the classroom; that a proper sequence should be shown in the arrangement of the college courses; that there should be a conscious differentiation of aim of work in secondary school, college, and university; that the work of teaching history in the secondary school or college should not be given over to men who are specialists in other departments; that methods which encourage cramming, in either secondary school or college, should be abandoned; that secondary-school and college teachers should attempt to adapt their methods and their work to the students under their instruction; that courses on methods of instruction in history for colleges should be established for the benefit of those who expect to teach in colleges; that students in history courses in colleges may reasonably be expected to buy more books than they are at present called upon to do.

Investigators and historians found special help in Professor McLaughlin's suggestive account of the historical work undertaken by the Carnegie Institution. This has as yet been largely in the direction of planning for the future. What the historical scholars of the country need is information in regard to the existence and location of historical material, and how this material may be made accessible. The bureau at Washington has already rendered scholars valuable service in this direction, and it bids fair to develop still more along these lines.

It is not too much to say that the Philadelphia meeting was one of more than or-

dinary or local interest in view of the distinguished men who took part in its discussions, and of the far-reaching character of the propositions advanced. It is to be hoped that its success will lead to the formation of similar associations in other sections of the country.

ARCHÆOLOGY IN EGYPT.

CAIRO, February 21, 1904.

For many years, excavations have been carried on in various parts of Egypt under various auspices, and this year is no exception to the rule. Among such as are now in progress, those of the University of California, made possible by the liberality of Mrs. Hearst, yield to none in importance. At Naga ad-Der, opposite the thriving town of Girga, Messrs. Lythgoe and Mace are bringing to a close the work begun several years ago and continued every winter. Here thousands of tombs have been opened, belonging to all periods from prehistoric times to the Twelfth Dynasty. The vast necropolis contains also tombs in an almost unbroken series to the Eighteenth Dynasty, and close by are tombs of the later New Empire, of Ptolemaic and Roman times, while Coptic burials cover nearly the whole site. In the tombs of prehistoric and early dynastic times the bodies were laid on the side and buried in a contracted position, sometimes with the knees almost immediately under the chin. The bodies lay upon a matting and were covered by a second matting. About the graves were twigs to keep the sand from falling in. For the same purpose boards were sometimes used. Terracotta boxes also occur, but not earlier than the First Dynasty. In these early tombs double and even triple interment is common. Some of the graves are quite undisturbed, others have been robbed of whatever articles possessed any value to the robbers, and in many cases the bones of the persons buried are greatly disarranged. It frequently happens that the neck vertebræ are lacking, and the head is more or less out of place. This is due to the fact that the grave-robber, instead of excavating the entire grave, merely made a hole in the upper matting and removed the necklace of the corpse, often taking the neck, or parts of it, along with the necklace. The examination and comparison of the immense number of interments at this place have proved beyond the possibility of doubt that the disarrangement of the parts of the body occurring in some of the graves is due entirely to subsequent disturbance—not, as has been suggested, to a practice of dismemberment before burial. Additional evidence has also been found proving that the marks of gnawing on some of the bones are due, not to an ancient practice of cannibalism, but to an insect that gnawed the buried remains.

The historical or ethnological results of the excavations at Naga ad-Der are interesting and important. Every part of the human body has been found, so that a systematic study of the physical qualities of the people buried there has been made possible, not for one period only, but through the ages from the earliest times. This has been undertaken by Dr. G. Elliott Smith, who has examined the burials on the spot and has arranged an exhibition of the human remains from this site at the medical school in Cairo. Since the site offers a continuous series of cemeteries all at the same place, there are no differences of locality to consider. This is important, for, as the science of Egyptology advances, it is becoming more and more evident that conditions in the different parts of Egypt were not always the same. Dr. Elliott Smith, after careful study of the human remains, reaches the conclusion that the Egyptian race, as represented at Naga ad-Der, was one single continuous race from the earliest prehistoric times to the Twelfth Dynasty. This result, derived from anatomical study, confirms the same conclusion which the excavators draw from the archæological evidence gathered from the same tombs. Dr. Elliott Smith's study of skeletons of other periods and skeletons of modern Copts leads him to the further conclusion that the continuity of race in Egypt persists to the present time.

The actual excavation at Naga ad-Der is completed, and Dr. Reisner, the head of the expedition of the University of California, is now busy near the Pyramid of Gizeh, where the University has been granted one-third of the necropolis for excavation. Here, in the valley north of the great cemetery which extends to the west from the Great Pyramid, Dr. Reisner has found a practically untouched cemetery of a much earlier period. The people buried here were poor, for the tombs are simple structures of mud brick, but the results, which supplemented those reached at Naga ad-Der, are sure to prove interesting. West of the Great Pyramid, work has been begun on the systematic clearing of the great necropolis, and about seventy mastabas, containing over three hundred burial pits, are already laid bare. Probably as many more will be uncovered before the work of this year is ended.

It is already evident that there are three distinct periods in the history of the necropolis. The earliest period belongs to the Third Dynasty, the second to the Fourth and Fifth Dynasties, the third to the Sixth and Seventh Dynasties. As yet the extent of the cemetery at each period is not known; but, as the excavations advance, its extent as well as its character at each stage of its history will no doubt be definitely determined. The excavations at Naga ad-Der have shed much light upon the development of the mastaba, and the knowledge gained there is of immediate use in the field by the pyramids. As yet few pits have been opened here, and the portable objects found, the bulk of which will probably go to enrich the museum of the University of California, are therefore few; but eight stone statues of various sizes, some of which are unusually fine, have already come to light. Moreover, one mastaba of the Fourth Dynasty has been opened, the corridor walks of which are adorned with fine reliefs executed on a thin coating of stucco. On some of these reliefs the coloring is still well preserved. Unfortunately, the neighborhood of Cairo is not so free from rain as the regions further up the river, and much of the coloring, as well as some of the stucco, has peeled off. It is also due to the dampness that no wooden statues, many of which were once contained in the serdabs of these mastabas, have been preserved. Besides continuing the work in the cemetery, Dr. Reisner intends to begin work soon on the temple of the Third Pyramid, which has never been excavated.

At Abusir, between the pyramids of Gizeh and Sakkarah, Dr. Borchardt is continuing the excavations of the Deutsche Orient-Gesellschaft at the pyramid of Ne-woser-re, of the Fifth Dynasty. Here he has laid bare the foundations of the temple belonging to the pyramid, with its paved court, great hall, and storerooms. The approach to the temple from the plain was by a grand causeway of fine masonry. On this causeway was a passage once not only protected by a wall on each side, but actually roofed over. Those who passed to or from the temple were therefore effectually prevented from enjoying the really beautiful view across the desert and the green plain to the hills at the other side of the valley. Some of the reliefs of the lower part of the passage, with unusual representations of the King and his enemies, are still *in situ*. At the foot of the causeway was a huge gateway, twenty by thirty metres in extent, which has not yet been completely laid bare. Enough has, however, already come to light to give some idea of the general arrangement. The structure is much grander than the gateway by the pyramid of Onnos at Sakkarah, and may, when the excavation is completed, throw light upon the arrangement of that building.

At Sakkarah Miss Murray and Miss Hansard are making facsimile drawings of the reliefs in the tombs for the Egypt Exploration Fund, and Mr. Weigel, at the expense of Dr. von Bissing, is copying and photographing the reliefs. Mr. Davies is making facsimiles of the more important reliefs in the tombs at Tell el-Amarna for the Archæological Survey of the Egypt Exploration Fund. Such work is of great importance, for, even in Egypt, works of sculpture, and still more paintings, are sure to suffer after excavation. Messrs. Grenfell and Hunt are this winter again at Oxyrrhynchus, where they are finding many papyri, some of which are reported to be of great literary interest.

The famous rock-cut tombs at Beni Hassan belonged to great princes of the Middle Empire. On the slope below are many less pretentious tombs of officials and other members of the upper middle class of the same period. Here Mr. John Garstang, assisted by Mr. Harold Jones, has excavated about eight hundred tombs for the benefit of the University of Liverpool. He has found, besides skeletons, pottery, alabaster vessels, and less important objects, a number of models of boats, two feet or more in length, with their crews, oars, masts, sails, and steering-gear wonderfully preserved. The weapons of the men are still lying on the deck. One model is that of a covered harem boat, in which sits a woman holding a mirror in her hand. Several models of granaries have also been found. In these the slaves are conveying the grain to the various compartments where it is to be stored, and realism is carried so far that the actual grain is contained in the storehouses. Two other interesting objects are a wooden statuette about twenty inches high, with well-preserved color, found in a tomb of the Fifth Dynasty, near the Speos Artemidos, and a fine wooden statuette of the Middle Empire about nine inches high. Mr. Garstang has also laid bare the floor of the front part of the Speos Artemidos, and is now clearing a number of shaft tombs of

the Middle Empire in that neighborhood and opening some graves in the low ground near the well-known cat cemetery.

Professor Petrie has been digging for the Egypt Exploration Fund at Henassi, near Beni Suef, and reports that he has found older foundations of the temple of Ramses II. of five different periods one above another. In the ruins of the temple he discovered a colossal statue of perhaps the Twelfth Dynasty. He has also found many gold, silver, and copper Byzantine coins. Coptic buildings in this neighborhood, among them what appears to have been a bishop's palace, with interesting paintings, have also been investigated, and Professor Petrie has excavated for smaller antiquities in several cemeteries near Henassi, but without very important results. About a fortnight ago he sent Mr. Carelli with thirteen men to Buto, near Alexandria, but whether the excavations there are meeting with success is as yet unknown.

In the neighborhood of Luxor, excavators are busy this winter at several points. Mr. Naville, excavating for the Egypt Exploration Fund, at Der el-bahri, has found a small temple of the Middle Empire so closely resembling the great temple of Queen Hatshepsu that it may well be the model of that remarkable building. At the Rameseum, Mr. Carter, inspector of antiquities, is carrying on extensive excavations with the purpose of laying bare all the surrounding buildings. These are very numerous—so numerous and various that the site, when fully excavated, will probably be almost, as it were, an Egyptian Pompeii. At Karnak the ground between the pylons at the back of the temple of Ramses III. is being cleared by the *Services des Antiquités*. Mr. Theodore M. Davis is still excavating the tomb of Queen Hatshepsu, where work was begun over two years ago. The tomb is already cleared to a depth of eight hundred feet, but the end is not yet reached. This excavation is supervised by Mr. Carter. Other less creditable excavation is being carried on by Mr. Mond, a wealthy Englishman of German Jewish extraction, who has obtained a concession from the authorities. His reis, or overseer, is said to be the brother of a dealer in antiquities at Luxor, and various objects from these excavations are offered for sale at Luxor. It is a pity that permission to excavate is granted to irresponsible persons.

The *Services des Antiquités* deserve in general great credit for the care that is now taken for the preservation of ancient monuments and the convenience of visitors. The more important monuments are carefully enclosed and guarded to protect them from defacement. The tombs of the kings, opposite Luxor, in which the colors of the reliefs are so marvellously well preserved, are lighted by electricity, and the use of other artificial light is forbidden, that the colors may not be injured by smoke or soot. It would be well if similar measures could be taken to protect the decorations in the tombs at Sakkarah. At Abydos, the temple of Seti I., the reliefs of which are the finest temple reliefs in Egypt, is being repaired, the blocks of limestone being taken, in part at least, from the ruins of other ancient structures. It is gratifying to see that the great monuments of Egypt, which have suffered so much at the hands of modern visitors, are now being intelligently, even if not yet perfectly, cared for.

One group of monuments is, however, doomed to speedy destruction. Philæ is still beautiful, but the greater part of the island is under water even now, and the water is not so high as it was earlier in the year. The so-called kiosk or bed of Pharaoh, which used to stand on an eminence high above the river, is now at the water's edge, while the long colonnades are submerged half way to the capitals. If the height of the great dam is, as is proposed, to be increased by some sixteen feet, the temples of Philæ will soon be things of the past. It is true that they are late structures, and that they add little to the world's knowledge of Egyptian art or civilization; but, taken together, in their beautiful surroundings, they were, and are even now, the most charming group of ancient buildings in Egypt. One cannot refrain from lamenting over their destruction, even though the great dam has already added 500,000 acres to the arable land of Egypt and is expected to add at least 500,000 acres more.

Here in Cairo the great and constantly growing collection of antiquities, after having sojourned at Bulak and then at Gizeh, is at last permanently housed in the new Egyptian museum. The antiquities are for the most part already arranged, though no doubt various changes will be necessary from time to time. In many respects the new building is admirable. It is large and airy, and most of the exhibition rooms are lighted from above. In some of the rooms on the ground floor the light is insufficient. One is forced to admit that the objects exposed seem to be arranged more or less to fit the building, as if the building were the chief thing rather than its contents, and there is an unfortunate dearth of rooms in which serious scholars can work undisturbed and with good light on papyri or inscriptions. But these defects may perhaps be remedied as time goes on. For the present it is cause for thanksgiving that the magnificent collection is exhibited in a dignified, spacious, safe, and dry building.

The Arabian Museum in the Bab el-Khalk is now completed, and the collection of Arabian antiquities was moved into its permanent home some weeks ago. Just now the Khedivial library, with its important manuscripts and miniatures, is being arranged in the upper story of the same building. Students of Arabian art and antiquities will find the new arrangement a great improvement, and there is every reason to hope that the collection of antiquities will grow now that it has a permanent and spacious home. H. N. F.

Correspondence.

NOTIFICATION OF WAR.

To the Editor of The Nation:

Sir: I have waited a little after reading Mr. Sargent Holland's reply to me, in the hope that some other pundit would preach more comfortable doctrine. Having waited in vain, I suppose I must resign myself to the belief that there is nothing in public law to prevent one nation from suddenly attacking another without notification of war. We seem, in this respect, to have gone back since the days of the Romans, who declared war in the most formal manner, clearly specifying the cause, and giving ample notice to the enemy. There is not much comfort in the suggestion that great predatory powers may be trusted to abstain from outrage. It seems to be clearly proved that the strenuous person who is now President of the United States deliberately and insistently proposed to destroy a Spanish fleet at sea when his country was at peace with Spain.

It is supposed that Russia attacked the Turkish squadron at Sinope without notice of war. This is a mistake. The state of war had existed between the two Powers on the notification of Turkey for a full month previous to that affair. Of war between Russia and the allies of Turkey there had long been ample warning on both sides, and at last there were regular manifestoes.

COLLEGE ATHLETICS.

To the Editor of The Nation:

Sir: If college athletes were allowed to play for money during vacation, as some propose, it takes no special gift of foresight to disclose two inevitable results. The first is that a very large number of them would do so. Their intense interest in the sport would lead to it, the chance to make a little money would also have its weight, and the value of the practice towards successful work on the college team during the year to come would lead other students (if not instructors as well) to exert a strong pressure in the same direction. The second result would be that the permitted summer pay would immediately become the dishonest disguise for what would be in reality remuneration for work on the college team during the collegiate year.

Professor MacDonald is thoroughly right in the assertion that the real question is simply whether any distinction is to be maintained between college and professional sports. Are the ideals and methods of professional athletics such that college authorities are warranted in promoting their introduction into college life? Would the average parent of a college student of today be contented to see his son directly influenced by college policy in this matter towards the conclusion that the life of the professional athlete would be a desirable career for him to follow after graduation? Do past history and present conditions warrant the conclusion that there is no material distinction in respectability between sport as a permanently accepted profession and sport as a pleasurable means to that sanity of mind and body which the young man needs while in college, in order to pursue his studies successfully and fit himself for some serious occupation in after life?

The cause of college athletics as a matter of intercollegiate rivalry has no worse enemy than he who counsels a drop to the professional level. To heed such counsel would be the signal for a reaction which would for a time endanger the very existence of sports which are of the highest value if conducted on a thoroughly honest and non-professional basis.

W. H. Johnson.

THE BUCKTAIL BARDS.

To the Editor of The Nation:

Sir: The authorship of the 'Bucktail Bards,' issued in 1819 as 'The State Triumvirate,' has never, I believe, been claimed, but is usually attributed to Gulian C. Verplanck. Two pieces of evidence have recently come to my attention. One, a letter from Johnston Verplanck to Martin Van Buren, is precise on this point. It is dated December 25, 1819, the very month in which the 'Triumvirate' made its appearance.

"With this you will receive a copy of the 'Bucktail Bards.' Dick Shift you will find in a more respectable dress, and the epistles of Pindar Puff somewhat improved. J. Duer is, as you know, the author of the first and G. C. Verplanck of the last, as also of the Prolegomena, etc. We shall send some of the numbers to Albany, and trust you will lend us your aid in giving an extensive circulation to what will annoy and injure Clinton more than any other mode of attack."

In the Library of Congress is a copy of 'The State Triumvirate' containing some manuscript notes written in 1838, or nearly twenty years after the publication. Dick Shift is said to be Thomas J. Oakley. This Federalist supported Clinton and received the office of Attorney-General, *vice* Martin Van Buren, removed. "The State Triumvirate" consisted of Judge Ambrose Spencer, De Witt Clinton, and one called in the poem "Fallacio," whose name is not given, but I believe him to have been Judge William W. Van Ness, against whom articles of impeachment were brought by the Federalists in the next year. One of the manuscript notes is as follows:

"Rudolph Bunner. One of the authors of this book. A wit and scholar, and considered a 'promising man' till the day of his death, which took place about a year ago (1837). In Congress about ten years ago. General Jackson's inaugural address is attributed to his pen. John Randolph considered him out of the most brilliant men of his time. A Federalist—as were Duer and Verplanck, the other authors—until about the date of this book, when they all 'ratted,' in company with other distinguished Federalists. They called themselves the 'forty high-minded,' their enemies called them the 'Forty Thieves.' "

Bunner is mentioned in Duer's poem—"What wicked jests had uttered Bonnor"—but this does not militate against his having had a share in the book.

Worthington C. Ford.

Washington, March 15, 1904.

Notes.

A. C. McClurg & Co., Chicago, announce that they will shortly issue in one volume a reprint of Patrick Gass's Journal of the Lewis and Clark Expedition, edited by Dr. James K. Hosmer, and uniform in style with the publishers' library edition of Lewis and Clark.

Herbert S. Stone & Co., Chicago, have nearly ready 'The World's Painters,' by James William Pattison.

'Our West India Neighbors,' by Frederick A. Ober, is in the press of James Pott & Co.

We are glad to learn that the great fire in Baltimore on February 7 spared the plates of the John Murphy Company, many of which were stored out of the city. This veteran publishing firm is temporarily established at the corner of Lombard and South Howard Streets.

Twenty-five years ago Mr. W. S. Baker issued his painstaking list of the 'Engraved Portraits of Washington,' so well made that collectors have come to recognize it as a necessary guide. The 436 items described were considered a very goodly number for a Washington collection, but Mr. Charles Henry Hart has found 880 distinct plates of engraved portraits of Washington upon copper and steel, and notes 634 different "states," making a total of 1,514 individual prints. Even this may be but a beginning, as there is no certainty that every state has come to his notice, and the collector has open to him a field large enough to gratify his every taste and exhaust his purse. With such a list as Mr. Hart has compiled, it is almost impossible to go astray, and the sumptuous form in which it appears, with its many photogravure reproductions of rare prints, will make it one of the most desirable of acquisitions. It does not follow that we are any nearer to a *good* portrait of Washington, one that can be taken as a standard. More than one-half of the prints recorded are from Gilbert Stuart, and from so well-known a representation to the extraordinary fictitious portraits every possible gradation of expression may be found. Some of the serious attempts are true caricatures, and such plates as that made by Paul Revere should be classed as curiosities. The Grolier Club has done well to issue in so satisfactory a form a compilation made by so capable a hand.

'Chats on Writers and Books,' by the late John N. Crawford, is the title of a limited edition of 275 copies brought out in two volumes by the Charles H. Sergel Co., Chicago. An introduction is furnished by Horatio W. Seymour. Mr. Crawford was a lawyer and newspaper essayist, and these "chats" are contributions to the press, covering a wide reach of English literature, from Lady Mary Wortley Montagu to Crabb Robinson. The essays, which it had been the author's intention to collect in a permanent form, seem to have been well adapted to their original purpose.

Under the title 'From Broom to Heather,' Prof. James Taft Hatfield of the Northwestern University has brought together ten pleasant sketches of a summer spent by him and a company of young Americans in the old Hessian castle of Staufenberg. The party boarded with the family of the ducal steward, but were given entire freedom of the whole castle, and seem to have enjoyed the strangeness of their situation with a keenness and zest reminding one of the experiences of Mark Twain's Yankee at King Arthur's court. Apart from lively descriptions of feudal traditions and relics, the little book contains also vivid impressions of contemporary German life in village and town, and accounts of excursions through a large part of middle and northern Germany, including a sojourn in Berlin. The clever illustrations are a credit both to the skill of the photographer and to the publishers, Jennings & Pye of Cincinnati.

'The Home Mechanic,' by John Wright (Dutton), is a volume of something over 400 pages dealing with wood and metal-working in a thorough if somewhat discursive manner. From the making of a simple wooden box—begun on the seventeenth page and finally completed on the fifty-third—the home mechanic is instructed in the niceties of cabinet work, taught the use of the lathe in turning both wood and metal, and given full working directions for the construction of a small steam-engine. Glazing, papering, whitewashing, soldering, electric wiring, and general household repairs are also treated; and the range should satisfy the most ambitious amateur. The directions are full and exact, and a proper emphasis is put on the selection and the care of tools, a number of which the amateur is taught to make for himself. The English authorship of the book reveals itself in some of the terms employed, which, like "joinery," "sprigbit," etc., have an unfamiliar sound to an American; in the little discourse on nails (p. 49), where the illustration shows unusual forms and names (the "French" nail with its "untidy" head); and in many other little ways. The author is evidently a man of wide mechanical experience, skill, and accurate knowledge in most of the matters with which he deals; but when he touches on electrical phenomena he is at once out of his depth. Some of the statements which betray him are distinctly funny. "Mrs. Galvani discovered galvanism by skinning frogs' legs, which she was preparing to cook for her husband's dinner in Paris." "Electricity can be kept in a bottle or other suitable receptacle in its separated condition"; and "can be compressed or expanded in much the same way as air or steam." The subject "is composed of a jargon of very 'scientific' terms; in fact, abbreviations of the names of people, spelt either backwards or forwards." It "is an interesting study when reduced to intelligible English, and freed from the jargon which so closely resembles that of a quack doctor, but the subject is much too long to be given in a book such as this. The amateur . . . should remember that the great discoveries are made by chance, and that with a little luck he can find some new property which he may call a 'Jack' or a 'Tom.' . . . Very little is yet known about electricity, but in the course of time its properties will probably be discovered. . . . In the present state of knowledge, electricity is a very dangerous toy to play with if used in large quantities; therefore the amateur must be careful."

From E. P. Dutton we have a handsome volume, printed in England, on 'Liquid Fuel and its Combustion,' by William H. Booth. The subject is one in which there is now a wide and general interest, and this work, which deals fully and authoritatively with the matters concerned, will be welcomed. The author gives an account of what has been done in the way of utilizing liquid fuels since the first introduction of the practice some twenty-five years ago; and discusses the development of practice and theory, with descriptions of various systems and the apparatus employed. The economies of liquid fuels are carefully considered, and chapters are included on boiler feed water and its purification, the storage and distribution of fuel oils, analysis of flue gases, and compressed air and air compressors. The work is well illustrated, and an appendix, which fills about one-third of the 400 pages, contains much valuable information in regard to official tests, the rules and requirements of fire underwriters, etc., and many useful tables.

A thin volume of 'Tables for Chemical Calculations,' by Professor Wells of the

Sheffield Scientific School (Holt), contains a five-place table of logarithms and logarithmic factors of all the data which are given. The book commends itself by some features which are novel in laboratory aid of this character. The one fault we have to find with it is a structural one. The first twenty-four pages are cut to facilitate reference to the logarithmic tables, with the result that one turns to the data on these first pages with considerable trouble and vexation.

'Physical Chemistry in the Service of the Sciences,' by Jacobus H. van't Hoff, English version by Alexander Smith (University of Chicago Press), is a small book with a striking portrait of Van't Hoff, of whose genius it is hardly worthy. We read in Mr. Smith's preface that "the lectures were delivered in English," yet the author speaks of the "version here presented" and of "diese englische Ausgabe"; so that we infer that the English of the original needed correction. It is, at least, interesting to see these matters dealt with by this important chemist and physicist.

The Société de Géographie of Paris has just issued, under the legacy of Renoust des Orgeries, the first number of the 'Documents Scientifiques de la Mission Saharienne,' by F. Foureau, chief of the expedition (Paris: Masson). The astronomical and meteorological observations here presented will be followed by reports on topography, geology, biology, ethnology and archæology. One must regret that the accounts of the wind and thunder storms, of which many were encountered, are so largely subjective as to give no clear idea of the entire disturbance, in which the observer could, of course, actually feel only a very subordinate part. It may be noted that the legacy of M. des Orgeries is to be applied to the aid of expeditions that are planned to bring the interior of Africa peacefully under the influence of France, and to make a homogeneous whole of her actual possession in Algeria, Senegal, and the Congo territory.

The exigencies of the German alphabet bring together, in volume five of the new edition of 'Meyers Konversations-Lexikon' —*Differenzgeschäfte-Erde*—(Leipzig: Bibliographisches Institut; New York: Lemcke & Buechner), wireless telegraphy, the three-plate color process, iron, railroads, precious stones, and electricity in manifold phases even to electrotherapy. These are all illustrated, the color printing in a very interesting way. So are the articles on eggs and evolution; the latter naturally overlapping the plates of embryology. There are excellent maps of Dresden, Düsseldorf, Edinburgh, Elberfeld-Barmen, Elsass-Lothringen, England and Wales; and a chart of earthquakes and volcanos. Encyclopædias are fitly treated historically. Dreyfus and Dumont rest amicably side by side in print. Frederick Douglass gets a quarter of a page, and a German edition of his autobiography, published in Hamburg in 1860, is cited; but the sketch is not too correct. There is a grave omission of President C. W. Eliot from notable Americans. As an example of what one may find, or expect to find, in this work, we may mention as a dictionary rubric Voltaire's "Écrasez l'infâme"—a cry much desiderated in this country for more than one evil element in our body politic.

Prof. Julius Goebel of Leland Stanford University contributes to the serial publication "Der Kampf um das Deutschtum" (Munich: J. F. Lehmann) the latest number, dealing with the German element in the United States. The author gives a readable and interesting sketch of the history of German immigration in this country; of the leading characters in this history from Pastorius to Francis Lieber and Karl Heinzen; and of the present condition, social and intellectual, of the German-American population. His expositions display a strongly pronounced personality with very decided sympathies and antipathies, so that the reader sometimes finds it difficult to maintain his own equilibrium of mind in perusing these pages. That a patriot like Carl Schurz should be characterized as "ein Mann, der für die Sache des klug von ihm benutzten Deutschtums nie etwas übrig hatte, als schadlose Redensarten," seems to be carrying partisan bias altogether too far. There is, however, a good deal of sound common sense in this book, and the author's insistence on the importance of the preservation of the German language in the interest of American society at large is entirely just.

The principal contents of *Petermann's Mitteilungen*, number one, are an account of the geology of Canada by Prof. H. Haas, an extended notice of the new edition of Stieler's 'Handatlas,' and Dr. K. Vogelsang's narrative of his expedition in central China to investigate the mineral resources of the Ta-pa-shan mountain range. He was led to form an unfavorable opinion as to their extent and richness, the coal being barely sufficient to supply the local demand. Dr. Andersson gives a sketch of the Swedish Antarctic expedition, with a summary of its scientific results.

The modern doctrine that mountain peaks and ridges usually owe their form to the erosion of valleys in broadly uplifted masses of the earth's crust, seldom finds better illustration than in those parts of the Cascade range that are described in recent essays by G. O. Smith and B. Willis (Professional Paper No. 19, U. S. Geological Survey). The mountains are shown to be an uplifted and maturely dissected portion of a broad lowland of erosion which formerly occupied a large area in this region, and of which the less uplifted and therefore less dissected portions are seen in the great lava plains of the Columbia River. The mountains are mountains not by reason of violent and disorderly uplift, as used to be taught, and as still may be believed in many quarters, but by reason of gradual and orderly stream and river work. They give us a good example of the veritable tortoise of uniformitarian erosion not only outstripping but even driving from the field the fabulous hare of catastrophic mountain upheaval. An appropriate corollary to this demonstration is found in the cañon of the Yakima, followed by the Northern Pacific Railroad, where the river has held its course and cut a gorge across several uplifts of the land that must have diverted the river to some other path had they been of rapid origin. Lake Chelan, an unusually deep basin on the eastern side of the Cascades, is ascribed to glacial erosion; but the omission of all mention in this connection of Gannett's noteworthy article on the lake (*National Geographic Magazine*, 1898) is a blemish on an otherwise edifying report.

A recent report from the University of Halle mentions the interesting fact that this institution was the first in Germany to give the medical degree to a woman, the present year being the one hundred and fiftieth anniversary of that event. It was in 1754 that the University created a daughter of Dr. Leporin of Halle a "Doctor Medicinæ." Her scientific studies had been carried on under the direction of her father, but in the University halls she defended a set of theses that secured her these academic honors. She is no doubt the pioneer of the modern university movement among the women of Germany, having as early as 1742 published a work entitled 'Gründliche Untersuchung der Ursachen, die das weibliche Geschlecht vom Studieren abhalten, darin deren Unerheblichkeit gezeigt wird, und, wie möglich, nötig und nützlich sey, dass dieses Geschlecht der Gelahrheit sich befleisse.' This first woman doctor of Germany died in 1762. We remark, by the way, that the University of Königsberg, in which the reaction against women students that set in about two years ago in the Prussian universities went so far that the medical faculty practically excluded women entirely, has, in a measure, relented. The medical department now again admits women to anatomical work, but not with the men.

In order to determine the average weight of the human brain, Professor Marchand of the Pathological Institute of the University of Marburg has, during the past seven years, examined 1,234 specimens. It appears that in the case of men between fifteen and fifty the average weight of the brain is 1,400 grammes; in the case of women 1,300 grammes. Only 30 per cent. of the males showed a weight higher than 1,450, and 20 per cent. less than 1,300 grammes. In the case of women, 25 per cent. had brains weighing less than 1,200 grammes, but 55 per cent. had brains weighing from 1,200 to 1,350. The difference in weight is not conditioned by the difference in bodily size, for men and women of the same size and weight show this difference as well as others. Professor Marchand asserts that the weight of the brain at birth is doubled in the first three-quarters of a year, and is trebled before the completion of the third year, after which period the rate of increase is much less. In the case of men, full development is reached at the age of eighteen or twenty; in the case of women, at sixteen or eighteen years. In childhood the ratio of the development of the brain and of the body is the same in males and females, independent of age, until the body has attained a length of 70 centimetres.

Beirut is the seat of the largest American institution of learning outside the United States, the Syrian Protestant College. Our consul reports that there are now 45 professors and instructors, 28 of whom are native Americans and graduates of American colleges, and 667 students. It has five departments, medicine, pharmacy, commerce, arts, and archæology. Last fall it trebled the size of its chemical laboratory and opened a "model pharmacy" in it. There are fourteen commodious buildings and a campus of about fifty acres. The English language is the principal medium of instruction.

A very comprehensive folding map of the theatre of war in the East has just been issued by the Bibliographisches Institut of

Leipzig (New York: Lemcke & Buechner). The main chart sweeps from Swatow and Formosa on the south to the middle of Saghalin, on a scale of 1:5,000,000. Side maps show Korea and the Yellow Sea environs (embracing Pekin), all enlarged to 1:3,000,000; the Liao-Tung Peninsula, with Port Arthur and Dalny, 1:850,000; Port Arthur itself, 1:22,000; the Tokio-Yokohama littoral, 1:200,000, and Yokohama 1:75,000. In this net all the operations by land and sea will surely be caught. The delineation is clear and elegant, and the only drawback to American use is the German transliteration; but, so far as China at least is concerned, where was a standard orthography ever attained, even in English? The author of this map is P. Krauss.

Equally deserving of mention and coming to us from the same New York house are two folding sheets of which the larger in form is A. Scobel's "Politische Karte von Japan, Korea, China und der Mandschurei" (Leipzig: Velhagen & Klasing). It contains seven maps: of the world for trade routes to China, of Asia for population, of Eastern Asia from Japan to Lake Baikal, Tibet, Burma and Tonkin, and the Chinese coast from Hong Kong to the northern extremity of Korea, with the environs of Canton and Hong Kong, Pekin and Kiao-Chau enlarged. The lettering is remarkably clear even when at its finest. The smaller form (but slightly larger sheet) is A. Herrich's 'Ost-Asien' (Glogau: Carl Flemming), also bearing seven maps paralleling some of Scobel's, but with Tokio and Seul added, the Gulf of Pichili for Port Arthur, and the Siberian railroad in connection with the European system. The continental map is mostly of the coast, and is on a liberal scale. Japan is shown in its entirety. While the execution is hardly abreast of that of the maps previously mentioned, the appearance is fairly open and legible.

Mr. William I. Fletcher's Summer School of Library Economy will open at Amherst, Mass., for the fourteenth season, on July 5, and close on August 12. Classes will be formed in French and German, with possible French and German boarding tables.

—In his capacity as president of the Massachusetts Historical Society, Mr. Charles Francis Adams last October commented destructively on the late Abram S. Hewitt's personal reminiscences concerning Queen Victoria's intervention in favor of the North during our civil war. It was a question of dates, place, and persons present, and not directly of the Queen's attitude of mind. In January Mr. Adams returned to the subject in a paper now partly reproduced in the Society's Proceedings (II., December, 1903—January, 1904). This is a compact little study of the mood and trend of the Palmerston-Russell-Gladstone Ministry up to the decisive point where its movement, looking to a European intervention in favor of a settlement of the American conflict, was suddenly blocked after the calling of a Cabinet meeting to that end. Mr. Adams gives abundant documentary grounds for believing that the veto proceeded from the Queen, probably while at Gotha, in the autumn of 1862, and through Lord Granville, then in attendance upon her; and not so much (if at all) from her own sympathy with the North or with the American republic as from her pious sense of being the depositary of the wishes of the late Prince Consort. Mr. Adams opines that "at the very most critical period of our foreign relations during the civil war—a period when it was simply touch-and-go with the Union—the whole course of events may not impossibly have turned on the individual attitude of the widow of Prince Albert." He suspects that the Granville papers, if examined, might solve the mystery of Palmerston's checkmate.

—In the series of monographs on "Historic Highways" which Mr. Archer Butler Hulbert is writing for Arthur H. Clark Co., Cleveland, the seventh volume, entitled 'Portage Paths: The Keys of the Continent,' describes geographically and historically these important roads—originally Indian carries, now the lines of important railways and canals, and often the main streets of large towns. Volume nine, 'Waterways of Westward Expansion,' is devoted to early navigation on the Ohio and other Western rivers; and volume ten, 'The Cumberland Road,' gives an account of our first national pike, built by Congress to open the West, which "carried thousands of population and millions of wealth into the West, and, more than any other material structure in the land, served to harmonize and strengthen, if not to save, the Union." In each of these volumes an important story is interestingly told. Publication of the eighth volume, 'Military Roads of the Mississippi Basin,' has been delayed to permit of more thorough investigation. It had been well if other volumes in the series had received the same consideration, for the successive volumes continue to demonstrate the excellence of the author's plan and the negligence of its execution. A fine opportunity has been wasted by an astonishing indifference to that accuracy of statement on which all valuable writing of history must rest.

—While space fails us to enumerate even the more startling misstatements, we suggest to the investigator that the errata may be usefully classified as follows: (a) Inconsistent misinformation: *e. g.*, the first steamer on the Ohio was built at Pittsburgh in 1811 (vol. ix., pp. 101, 137). It was built at Brownsville in 1811 (ix., p. 140). A regular line of steamer packets ran from Pittsburgh to Cincinnati in 1796 (i., p. 31). (b) Intermittent misinformation, as when Fort Frederic is placed alternately at Ticonderoga and at Crown Point. (c) Insufficient misinformation, as exemplified in saying that the names of Rome and Rochester, N. Y., were taken from the Classical Dictionary. (d) Ingenuous misinformation, wherein—the converse of (c)—an inexact statement receives verisimilitude by being adorned with plausible detail. Thus, after ignoring the Hudson-Wood Creek Portage and giving disproportionate importance to the portage from the Hudson to Lake George, the author adds, "The Hudson-Lake George portage is quite accurately drawn on Col. Römer's map of 1700." Römer draws a portage, and draws it accurately, but it is the portage to Wood Creek. His map indicates no route to Lake George. Mr. Hulbert takes opportunity "to offer a plea for the wide study of historic sites and for placing there monuments of some kind for the purposes of identification before it be all too late." In this plea we heartily join, with the added prayer that writers of serious history will refrain from setting up so many monuments in wrong places, and from displaying so many misguiding signboards along the Highways which they invite us to tread.

—Many interesting and little-known facts about Iceland are told in a small pamphlet of 80 pages entitled 'Mímir: Icelandic Institutions and Addresses,' printed in Copenhagen, and dedicated to the third Italian bibliographical conference in Florence. With a population of 80,000 inhabitants the island supports 41 periodicals, while 10 Icelandic periodicals are published in Selkirk and Winnipeg, Manitoba, for a constituency of 25,000 Icelanders! This colony has also several schools, churches, and other institutions. Iceland itself has not less than nine learned societies, one college, three professional schools, several high schools and agricultural schools, three museums, eight libraries, and its own national archives. There are three public funds for the encouragement of research and education, with a total endowment of approximately $40,000, and the annual Government appropriation for educational and scientific purposes amounts to upwards of $100,000 out of a budget of $450,000. The College of Iceland dates from the twelfth century, and the Althing is the oldest representative body in the world. The national library received some years ago from a donor who wished to be anonymous (and we will only say that he was an American) a remarkable collection of literature on the noble game of chess, of which the islanders are great devotees. The object of the present publication is (1) "to facilitate research, in the territory which it attempts to cover"; (2) "to inform the people of Iceland of the interest taken in their early literature and history throughout the world"; (3) "to bring the foreign student of Old-Northern letters . . . into nearer relations with the only region in which . . . the sagas are still household reading"; (4) "to promote the proper development, already happily begun, of that little nationality, a fragment of the old Teutonic world, which has kept itself alive, against innumerable obstacles, on the border of the Arctic seas."

—The natural wonders of Iceland are enthusiastically described, and the island commended as an ideal summer sanatorium, not at all difficult of access. "How to get to Iceland" is shown, as well as how to obtain Icelandic books for foreign libraries and to send books to Iceland. "The large public libraries will most gladly receive any books whatever, since their means for purchases are very restricted, and the demands of their readers insatiable; but, for the smaller book-collections scattered over the land, useful or entertaining (rather than purely learned) works will be especially acceptable—for not only is the fondness for reading everywhere great, but the opportunity for it, in the long evenings of winter, is most ample." In this connection it should be noted that, "next to Icelandic, Danish, and Swedish, the tongue most generally known throughout the island is English." The pamphlet gives the addresses of some eighty Icelandic scholars and more than two hundred foreign writers on Icelandic subjects, with an additional fifty in a supplement; their most important writings are mentioned, and the editors intend to make this bibliographical feature more prominent in a new issue which may be expected to come out some time this year. "To attain

the desired completeness," the editors state in the preface, "additions and corrections, changes of address and other information will be gratefully received and gladly used if addressed before June 1, 1904, to Mímir, Lungo il Mugnone 11, Florence, Italy." A request addressed as indicated will presumably secure to the interested a copy of the pamphlet itself.

—The art competitions encouraged annually at the New Year's season by the metropolitan newspapers of Tokio, Osaka, and Kioto, show little tendency to depart from fixed ideals and traditions. There is, indeed, among the score or so before us, one picture possessing some artistic merit, by Eisaku-Wada of Paris, a Japanese student who sends a well-produced semi-nude figure of Echo. In the French impressionist style, a young woman unclothed above the waist, stands against a background of green trunk trees in the forest gloaming. It is probable that such a picture cannot be acceptable to the Japanese, who, except in the case of a narrow circle of admirers, thus far have shown very little tendency to enjoy or appreciate the nude in art. Among the rich color pieces are those of a damsel holding a mirror, and another of a little girl within the house playing with her silk-wound ball in front of the New Year's decorations. Another, with appropriate poetry, shows in delightfully harmonious coloring a nineteenth-century lady of the court, and is a feast to the eye. One striking color print represents with pleasing accuracy that mediæval literary lady, Murasaki, whose famous novel of the eleventh century is still to-day not only a classic, but the acknowledged standard of the language—whether for Bible translation or the higher ranges of pure Japanese style. Most interesting to the lover of folk-lore is the daughter of the dragon king of the world under the sea, who moves through the sparkling waves to her home among the coral groves, with all her towers and pagodas flaunting banners of nacre and flags of pearl. If any one doubts that the art of Japan is living, and has been as yet but slightly influenced by the Occident, a single glance at these twenty specimens of recent art work thus patronized and stimulated by the newspapers would convince him to the contrary.

MRS. PAGET TOYNBEE'S EDITION OF WALPOLE'S LETTERS.

The Letters of Horace Walpole, Fourth Earl of Orford. Chronologically arranged, and edited with notes and indices, by Mrs. Paget Toynbee. In sixteen volumes, with portraits and facsimiles. Vols. I. to IV. Oxford: Clarendon Press; New York: H. Frowde.

It is difficult to add anything to what has been often and well said of Horace Walpole. His character, personal and literary, is rare and exceptional, but not hard to understand or to depict. It is, as observed by Macaulay, whose good sense here as elsewhere hits the mark which his vehemence of language seems to overshoot, the character of one to whom affectation is so natural that it ceases to be affectation. "The art itself is nature." The uniqueness of his position as a man of letters may be summed up in the observation that he is one of the few who have achieved real distinction by perfection in little things. What in the hands of another man of equal gifts might have been great, is with him small; what such a man might have disdained as small, he has made great. He is one of perhaps the only three persons who have obtained great celebrity in the world of letters by familiar correspondence alone—the younger Pliny, Madame de Sévigné, and himself. Other famous letter-writers, from Cicero to Edward FitzGerald, might possibly have gained immortality by letter-writing alone, but have so much wider and more substantial claims to recognition that their familiar correspondence merely counts, as Wordsworth so prettily says of Dante's sonnets, as a myrtle leaf in the chaplet of bay. Pliny and Madame de Sévigné had probably no great capacity for other kinds of composition, but Walpole, as historian, critic, and romancer, possessed not only talent, but originality. The apparently idle and frivolous hunter of curiosities was really a pioneer. His 'Castle of Otranto,' the first blossom of the romantic revival in Europe, actually anticipated by a few months the publication of the Percy Ballads, from which that revival is most commonly and perhaps most accurately dated. His 'Historic Doubts' respecting Richard the Third, though his particular thesis may be unsustainable, set a wholesome example of independence in historical research. Yet these works, though noteworthy as chronological mementos, would in no other respect have immortalized the author.

The accepted explanation of this phenomenon is no doubt the correct one. Walpole was not only an author, but a fine gentleman, and wrote in mortal dread of compromising his social reputation. He went further than Eugène Sue, who is said to have invariably written in a pair of lemon-colored kid gloves, presented to him by a lacquey upon a golden salver. Walpole's kid enveloped the whole man. Hence his relations with Fame, in so far as concerned what might have been the serious part of his work as an author, resemble Congreve's relations with Voltaire. Congreve, when visited by the latter, disclaimed all interest in his dramatic works, and affected to desire to be regarded solely as a fine gentleman. Voltaire told him that if he had considered him merely in this light, he would not have come to see him. If Fame has visited any of Walpole's works besides his letters, it is the delightful and truly valuable Memoirs of the Reigns of George the Second and George the Third, which approach most nearly to the character of letters, and might almost pass for letters addressed to himself by himself, and fused into a continuous narrative by the excision of the formal headings and conclusions.

If Walpole comparatively failed as a serious author through posing as an amateur and dilettante, he succeeded all the better in a style of composition from which amateurism and dilettantism were excluded by a genuine wish to excel. The labor requisite to make him a valuable historian or a sound critic of art was repugnant to his nature, but he did not mind spending any amount of time in seasoning a paragraph or polishing a period. He combined the characteristics of the preachers and the actors of his age, who, said Garrick, respectively delivered discourses on momentous themes as though they were matters of no consequence, and declaimed fictions as though they were insisting on solemn truths. There is scarcely one of Walpole's letters, on however trifling a subject, which does not bear the trace of careful composition. He showed that he looked to posterity as well as to his correspondents by keeping copies of his letters, and, when he could recover the originals, destroying or revising these with no sparing hand. Most of his letters to Mme. du Deffand, reclaimed by him, have disappeared, probably because he found their French incorrect; the letters to Sir Horace Mann survive only in expurgated copies. "His worst he kept, his best he gave," is as true of him as of the poet, and it is but justice to gauge his worth by his epistles. About the merit of these there have been no two opinions. They entirely fulfil the two chief conditions we are entitled to exact from the familiar letter-writer, that he should paint the sphere in which he moves, and that, in so doing, he should paint himself. This Walpole effects with perfect success, and has the advantage over every eminent competitor except Cicero and Sévigné that his sphere is not a coterie, but a large, cultivated, animated, and brilliant if frivolous society.

The name which has hitherto been chiefly connected with Walpole's in an editorial capacity is that of Peter Cunningham. Cunningham is by no means immaculate as a man of letters—as a would-be illustrator of Shakspere, indeed, there are serious stains upon his character; but as an editor of Walpole he could not go far wrong within the limits which he prescribed to himself. He collected such letters as were already in type or could be procured without much difficulty, printed them handsomely on good paper, supplied a modicum of useful annotation, and produced nine volumes exceedingly becoming to the shelf, from which, it is just to add, they have up to our time been continually taken down. After forty-six years' reign Cunningham is dethroned by a lady, who beats him out of the field by sheer weight of metal. Whereas the last issue of Cunningham's edition has 2,654 letters, representing 95 correspondents, Mrs. Toynbee's edition will have 3,061, representing 150. It will be observed that the proportion of the new correspondents is much in excess of the proportion of new letters, and this is highly significant. Cunningham took what was already conspicuous, Mrs. Toynbee has hunted in nooks and corners. She has cared supremely for her author, and has aimed at erecting a monument to his memory; Cunningham merely thought of achieving, as creditably as might be without much labor, a pleasant and lucrative piece of literary work. Mrs. Toynbee's zeal, on the other hand, has guided her to autograph dealers, to auctioneers' catalogues, to back numbers of periodicals, and to the stores of collectors like the late Mr. Alfred Morrison. Most of these recoveries seem to belong to Walpole's latter days, for the number of letters in the four volumes of this edition already published not already in Cunningham's is not very considerable, and but few of these are now printed for the first time. Some, however, have hitherto appeared only in places where they could be accessible but to the few. Among these is the earliest letter of Walpole that has been preserved, one addressed at the age of fourteen to Charles Lyttelton, afterwards Bishop of Carlisle, and the ac-

complished scholar to whom the Society of Antiquaries is believed to be indebted for its unique collection of single-sheet royal proclamations. Few schoolboys of the present day could write so elegantly, or would write so formally. Some verses enclosed have not been preserved.

Mrs. Toynbee not only has added numerous letters to Cunningham's edition, but has ascertained remarkable facts concerning letters already in print. Cunningham's text has been shown to be frequently faulty in the case of letters first printed by him, even when he had access to the originals. He has also perpetuated many errors of his predecessors, including a very odd one by which Mrs. Piazzi was converted into Bruce, the African traveller. His omissions are usually justifiable on the ground of propriety, and Mrs. Toynbee has felt herself necessitated to follow his example in the case of a large portion of the letters to Sir Horace Mann, which Cunningham republished, but apparently saw only in print. The originals of the letters to Mann are not in existence, having been destroyed by Walpole himself, to whom, in persuance of an arrangement between the correspondents, they were periodically returned. This proves that Walpole, from an early period, contemplated publication and aspired to epistolary fame, and this appears still more evidently from his having caused numerous passages to be omitted from the transcript made by his direction, and then destroyed the originals. The proscribed passages were nevertheless copied separately by his faithless secretary; but, these copies having been eventually given up to and burned by Walpole's executor, the passages are lost to the world, if that can be said to be lost which in all probability is no loss. So defective, indeed, was Walpole's *index expurgatorius* that the first editors of the correspondence, instead of vouchsafing the smallest hint to the public, omitted a considerable portion of what Walpole had retained; and their twentieth-century successor, albeit possessed with more than an Athenian's eagerness to hear or tell some new thing, is constrained to approve and imitate their action. The same remark applies to the omissions made by Cunningham in the letters to George Montagu. Whether similar or equally valid reasons justify Lord Ilchester's refusal to allow Mrs. Toynbee to see the letters in his possession cannot at present be known. The Earl's character for urbanity and culture requires Walpole to be scandalous; readers, nevertheless, will scarcely refrain from wishing his lordship churlish, and the letters fit for publication.

In other cases, Mrs. Toynbee has been unable to confirm the judgment of her predecessors; she has, for example, restored numerous passages in Walpole's letters to the Misses Berry which were omitted not merely by Cunningham, but by Lady Theresa Lewis, who had herself made many additions to Cunningham's text. As these are among the last in chronological order, it is as yet impossible to say whether Mrs. Toynbee's additions are of much importance—probably not; but it is always worth while to preclude all suspicion of garbling. There seems to have been much of this in the case of the letters to Hannah More, and Mrs. Toynbee particularly regrets not having been able to inspect the originals of all of them, since in those which she has examined passages have been cancelled and proper names erased, a disfigurement imperfectly compensated by the insertion of words and phrases by the elegant pen of Hannah More herself. Out of 177 letters to Marshal Conway, the originals of twenty-seven only are available for collation. Where can the others be? The letters to Madame du Deffand, seven excepted, are certainly irrecoverable. Out of the three thousand and odd letters promised by Mrs. Toynbee, the four volumes now published contain 720, down to November, 1760, the last being the celebrated account of the funeral of George II., with the description of the demeanor of "the burlesque Duke of Newcastle, running about the chapel to spy who was or was not there, spying with one hand and mopping his eyes with the other."

In the points of print, paper, and illustration, these volumes are in every way worthy of the Clarendon Press. The neat impression on India paper is especially to be commended, as it abolishes the difficulty of space, which might exclude the library edition from many dwellings, the sixteen imposing tomes being reduced to eight pocket volumes. Four illustrations are given with each volume, all so far portraits, except the welcome facsimile of Walpole's first letter. There will be eleven portraits of the author himself, three published for the first time. The first of these in date, the frontispiece to the first volume, prophetically represents "Master Horace Walpole" in the act of writing. The only criticism we can find to offer respects the annotation, which is excellent in quality, but might have been more ample. Walpole's own notes are preserved, except when mere repetitions; and Mrs. Toynbee "has added others whose usefulness, so far as they go, make us wish that they went further. Some ambiguous points are left unexplained, and the general reader would have been thankful for some information respecting many of the personages mentioned. It certainly would be inexpedient to swamp the text with commentary, but an accompanying volume of notes might be made almost as entertaining as the text itself.

MORE NOVELS.

Two Sides of the Face. By A. T. Quiller-Couch. Charles Scribner's Sons.

The Deliverance. By Ellen Glasgow. Doubleday, Page & Co.

The Novels, Stories and Sketches of F. Hopkinson Smith. "Beacon Edition." Charles Scribner's Sons.

Mr. Quiller-Couch's story of a butler personating his absent master can make none but the unskilful laugh. In his ghost story the ghosts are as detached from any reason for existing as they are from the flesh. But of the eight in his book, these two are the only stories that are not characteristically good. The rest range over the latter half of the eighteenth century in England, illustrating the rough living, violent manners, and military compulsions of a period when rudeness ruled the Court, the camp, the grove. When Mr. Quiller-Couch's heroes go on secret service in the Peninsular campaigns, or when his Cornish men undertake to defend their hearths and homes from the sheriff, a good story may confidently be expected—a rattling good story, we might say if there were not in his tone and topic something of more dignity than rattle; say, rather, a well-controlled thunder. No better story of its kind is to be read than "Stephen of Steens," whose house was his castle, "not perhaps by law, but assuredly by right."

Says the heroine of Ellen Glasgow's novel, in speaking of the love of a certain wife for her unsatisfactory husband, "It was a great love, which is the next best thing to a great faith." Answers the hero: "It was more than that—it was a great deliverance." The book may be called the story of a man's deliverance from evil by the love of a woman—a love great, compelling, conquering, and (if the mere reviewer may say so) stolid. When a woman finds that the man she loves has been engaged for five years in deliberately corrupting her brother in order to serve his own purposes of revenge, it would seem that his confession should turn her at least temporarily from him. Not in the least in the case of Maria Fletcher. Even at the moment of revelation, "her faint smile was still sketched about the corners of her mouth." Only later come "smothered sobs," and then words of incredible leniency: "Oh, how unhappy—how unhappy you have been!" Even the moral-suasion Mother, when Mary pushed baby into the street, held up her finger at Mary. Probably few things in a lover are so irresistible for a woman as to find him renouncing wrong-doing for her sake; but when that wrong is the prepense ruin of her own brother, body and soul, forgiveness itself might well forget its errand for the moment. In truth, the whole story of Christopher Blake's revenge on the overseer who is supposed (never proved) to have cheated him out of his ancestral acres, is an over-painful one to weight the hero of a novel withal. Were he pirate or murderer, he would be easier to follow. His godlike brow and his brutal mouth are contradictions of which the resultant is a creature to be beloved by the author only; certainly not by the reader—least of all, one would think, by the heroine at first sight and ever after, through her own unhappy first marriage and without flinching in the face of the discovery that he has sent her young brother to the dogs. His final sacrifice in taking upon himself punishment for the crime of the boy whom he had rendered capable of committing it, is fine enough to justify the reader in a little relenting—an act of grace impossible to a heroine already hopelessly committed to her infatuation.

The passion of the Blake family for the land that Blakes had lived on for two hundred years, is as intense and ineradicable as that of Quiller-Couch's Stephen of Steens. The picture of the defrauded and exiled family is full of pathos, and would be even more moving if, through any of the lamentings or reminiscences or heroic adjustment to privations, we could discover that the passion for the past included any higher or deeper sentiment than the passion for old port, old mahogany, old brocade, old plain thinking, and old deep drinking. It would be pleasant to love as well as pity the blind old dame who, in her silk and lace, lives for years on the kindly lies of her family and fancies herself still in her old home, the citizen of a firmly established

Southern Confederacy. Her memories of past grandeur are punctuated with epigrams of the cynical sort, chiefly about marriage. Though she says that to be a gentleman "embraces all morality and a good deal of religion," in reality she places less stress on either than on social correctness in adventure, and good breeding in the use of the ash-tray. The cheerful, optimistic old soldier wreck who has learned to be happy in watching the sky and the dandelions, regrets least in his life "his youthful follies," and "likes best to recall" the fact that he was ready to ruin himself for a woman—"even though he didn't." Are these the ideals that chivalry stores up for old age? The pretty daughter whom all the others spare in the general drudgery of their bitter poverty, is the familiar Southern type in the familiar faded flowered-muslin style, within and without. The spinster sister who carries the family on her shoulders and imposes her saintliness on theirs as reprisal, is a piteous likeness of many a Southern daughter surviving her family's days of luxury; slaving endlessly for them, with a vast legacy of pride of the sort that handicaps rather than helps. The heroine, sprung from the despised overseer class, is the real aristocrat of the group, barring the anomaly of her attitude toward the hero. Among the poor whites are some delightfully humorous characters. Mrs. Spade's downright views of life, for all their caricature, seem to clear the air of Mrs. Blake's musky fine-ladyism: "The best rule to follow, accordin' to my way of thinkin'," says Mrs. Spade, "is to make up yo' mind right firm that no matter what evil falls upon a person, it ain't nearly so bad as the good Lord ought to have made it." "'Virtue may not take the place of beaux,' my po' ma used to say, 'but it will ease her along mighty well without 'em.'"

Tobacco is a leading character in the story. We see the Virginians looking to it for their daily bread as for their daily work; we follow it as a crop and as a motive; we see Virginia methods of two hundred years ago still applied to the processes of the planting and the harvest; we see the human struggle surging round it as it always surges round the mainstay of material life, whatever that may be. Whatever glamour tobacco can borrow from sunrise and moonlight is here with all the dignity that labor's hard hand can bring. Not as poison, luxury, or comfort does it win a thought, but as life or death. Instinctively Millet's pictures come to the mind's eye as one follows the struggle of man with Nature. With its many interests, black, white, human, inanimate, ethical, social, psychologic, 'The Deliverance' offers richness and variety. The writing is almost wholly good, the reading often so, however one may protest against improbabilities, or however weary one may have become of decayed Southern gentility.

The tenth volume of the "Beacon Edition" of Mr. Hopkinson Smith's works closes the subscription edition as originally announced. But why may we not hope to welcome many more volumes so long as publishers and author shall live—each volume in its cheerful cloth dress, each with its colored illustrations from the writer or other competent sources, each with its beautiful paper and printing and with its water-marked lighthouse on every page, token of the author's reputation in making beacons and stories well-built and shining? Of the lighter aspects of travel there is no more bright, cheery, open-eyed chronicler than Mr. Hopkinson Smith. A happy hospitality of mind toward mankind, a huge appetite for picturesque experiences, a painter's eye, a gypsy's joy of life, a robust, unorganized charity for the under dog, a humorist's sense of situation, a constructor's sense of climax are the palpable features of his equipment. His stories are conspicuously to the point; a small point, it may be, but polished and executive. Charming are his sketches of all lands of color, be they Mexico, Holland, or Italy.

When it comes to portraiture, like other portrait artists Mr. Smith excels in one direction. One who has taken out of life and put into literature Colonel Carter, Chad, Captain Joe, Major Slocomb, Mr. Moon, and the Man from Troy has generously atoned for the artificiality of many others of his men portraits and most of his women. Of these, 'Tom Grogan,' the woman stevedore, is the most widely celebrated, but even Tom reads like an episode expanded into a bursting Cardigan jacket. As the heroine of a short story, we can fancy her the very spirit of womanly hauling. What is above and beyond this is perilously near the "mitherless bairn" fashion of portraiture. So, too, the many gentle old Southern ladies in the gallery remain in mind as fluffy creations of lace, white locks, and pot-pourri, turned out after a conventional pattern and quite undifferentiated.

Between the short stories and the Novels we make an analogous comparison. The stories stand with the best of the men portraits, let us say; they are nature reflected and interpreted. The novels, on the other hand, have a touch of the process method—thus much episode, thus much purple and fine linen, thus much dinner-pail; a little love, a little more sentiment, a few tears, a due portion of laughter, three table-d'hôte meals a day with wine or beer, all disposed about the central real achievement—the historically valuable Southern home, the admirable lighthouse, the lovable pump, the captivating diving-bell, the fascinatingly personal engine. These be the true heroes of his novels—the cake to which the folk are icing, with an over-tendency to sugar. Captain Joe and Captain Bob may be excepted. They are as winning as enrockment blocks and boat derricks. And yet we like them even better when they figure in the short stories. In these, indeed, there is rarely a person, a phrase or a color that does not absolutely fit into the scheme, and one may be sure that all conduce to a final touch which proves to be an accolade.

BOOKS FOR MUSIC LOVERS.

Wagner's Parsifal. By Maurice Kufferath. Henry Holt & Co.

Theodore Leschetizky. By Comtesse Angèle Potocka. Century Co.

The Life of Hector Berlioz. Translated by Katharine F. Boult. E. P. Dutton & Co.

Founders of Music. By Hannah Smith. G. Schirmer.

The Ring of the Nibelung. By Alice Leighton Cleather and Basil Crump. G. Schirmer.

Woman's Work in Music. By Arthur Elson. L. C. Page & Co.

The English translation of Professor Kufferath's admirable monograph on "Parsifal" appeared first about the time of the production of that opera as an oratorio under Anton Seidl's direction in Brooklyn, in 1890; it has been out of print for some time, and now reappears with an introduction by H. E. Krehbiel, and with all the mistakes of the first issue. Over and over again the word harmonies is printed harmonics, as it was in that edition; and, pray, what is the "trituration of motives" we read of on page 294 (where we also find modulation in place of modulations)? The new edition would no doubt have had a large sale had it appeared three months ago, when booksellers were at their wits' ends to supply the demand for books on Wagner's *Bühnenweihfestspiel*; but it will not be ignored now, for "Parsifal" will endure.

Of all the treatises on Wagner's last music-drama, this is by far the most elaborate and scholarly. In its 300 pages the opera and its subject are discussed from every imaginable point of view, and always readably as well as reliably. The sources of the play are discussed, and comparisons are made of the treatment of the Grail legend by other poets with Wagner's. But, of the nine chapters, the two which will interest the largest circle of readers are that on the first performance at Bayreuth, and another one, on the score, which analyzes the music with the aid of notation, to illustrate the leading motives. Professor Kufferath calls attention to the significant fact that the instrumentation of "Parsifal" alone occupied Wagner for nearly three years, and he dwells on the care the composer took to keep the whole work in the "simple tone of sanctity." He wished to suppress certain modulations and intervals that were not in this tone, and to avoid all pathetic harmony and sentimental melody. Saint-Saëns, we are told, felt inclined to criticise "Parsifal" in 1882; but in a moment of expansion he admitted to M. Stoullig that "one felt like a very insignificant sort of fellow when listening to such works."

The Countess Potocka is the sister-in-law of Leschetizky, the teacher of Paderewski, Essipoff, Fanny Bloomfield Zeisler, Schütt, and other eminent pianists of our time. Before he made a special vocation of teaching, he himself was a prominent concert pianist, and his adventures in divers European countries were varied and often romantic. They are related picturesquely by the Countess, who got her facts partly from his own mouth, partly from his diaries. Many eminent musicians figure in her pages, among them Liszt, Rubinstein, Thalberg, Donizetti, Meyerbeer (one of whose daughters was Leschetizky's pupil), Bülow, Lamperti, Paderewski, Goldmark. Chopin, his idol, he never had a chance to meet, which he regretted on musical rather than on patriotic grounds. In Leschetizky, we are told, "cosmopolitanism has smothered the love of country. In general he has little good to say of Poles, maintaining that they are underhanded and ungrateful." He has become a Hungarian subject, and he left the Catholic Church in order to marry Essipoff. As a teacher he is now in such demand, especially by American girls, that he needs four assistants to prepare them for him (*Vorbereiter*, they are called). It does not take him long to recognize talent. When

he first brought out Paderewski, a Viennese musician remarked that "the young man did not seem to promise much"; but his teacher retorted: "My dear sir, you will have to get used to hearing that young man's name." The Countess comments on Paderewski's wonderful gift of mind-reading and his childlike enjoyment of fun. Sometimes, we are told, he would "laugh so heartily that, through sheer exhaustion, he would sit down on the floor, and with no symptom of embarrassment at his undignified position." Some of the details given regarding Leschetizky's teaching are likely to frighten intending pupils. We read of him as throwing music at pupils; of "the often hasty retreat of the unfortunate pupil," "the thundering rage of the old man." However, "he is quickly soothed, and often expiates his harshness by a sleepless night of remorse."

The Dutton edition of the 'Life of Berlioz' is one of the Temple Autobiographies. It is the story of his career as told by himself in his letters and memoirs. The translator, Katharine F. Boult, recognizing the unreliable character of Berlioz's Memoirs as a character-study, has mingled with them the contents of his best letters, and the result is a most entertaining book, with hardly a dull page. Humor is one of the principal traits of Berlioz's writings; yet, as the translator points out in an introductory chapter, "he never discovers—as a man with a true sense of humor would have done—that in sharpening his rapier at Wagner and the Music of the Future, he is meting out to a struggling composer precisely the same measure that the Parisians had meted out to himself." In June, 1855, he writes gleefully from London that Wagner "is buried beneath the vituperations of the whole British press. He remains calm, for he says that *in fifty years he will be master of the musical world.*" A letter to Wagner, written three months later, he ends with the words: "Write me down an ass until further orders." In 1861 he is madly delighted with the fiasco of "Tannhäuser" in Paris. "Coming out, Wagner was vituperated as a scoundrel, an idiot, an impertinent wretch. . . . The press is unanimous in damning the opera."

Hannah Smith's little book on 'Founders of Music' is a series of "life-sketches for young readers," the composers selected being Palestrina, Bach, Handel, Gluck, Haydn, Mozart, Beethoven, Weber, Schubert, Mendelssohn, Schumann, Chopin, Liszt, Wagner. Familiar facts are presented in simple language, and there are a baker's dozen of portraits.

'The Ring of the Nibelung' is one of the numerous analyses of Wagner's tetralogy. The stories of the four operas are told in detail, and some of the leading motives are given in musical type.

Arthur Elson's book makes out as good a case as any one could for women in connection with music; yet it is a weak case at best, except on the side of interpretation. The question, "Where is there a single piece of first-rate music written by a woman?" still remains unanswered. Mr. Elson reviews his field in a comprehensive manner. After two chapters on ancient and mediæval times, he treats of the wives of composers. Clara and Robert Schumann get a chapter by themselves; then follow one on other musical romances, and half-a-dozen more on the musical women of England, Germany, France, America, and other countries. Most of the names given are as unimportant as they are unfamiliar. Here, for instance, is Mr. Elson's partial list of women who have written orchestral works: "Augusta Holmes, Chaminade, Luisa Lebeau, Emilie Mayer, Mme. Farrenc, Comtesse de Grandval, Elfrida Andree, Edith Chamberlayne, Mrs. Meadows-White, Aline Hundt, Oliveria Prescott, and in our own country Mrs. Beach and Miss Lang." A list of the men who have written orchestral works of the same degree of merit as these women would fill up most of the pages of Mr. Elson's book.

The Tariff Problem. By W. J. Ashley. London: P. S. King & Son. 1903.

The ideal that Mr. Chamberlain and those who follow him have placed before themselves is simply domination. The sight of "all the kingdoms of the world, and the glory of them" is too great a temptation to be resisted. So the author of this book is "loath to see the English people surrender their share in guiding the destinies of the world." He cannot bear to think of England's sinking into the position of Switzerland or Holland. She must dominate; she must be one of the three coming "world-empires." The only possible way to secure this position is by combination with her colonies. The only way to bring this about is to tax the trade with other countries, and exempt colonial trade. Of course, the man or the nation that proposes to dominate or to domineer will arouse jealousy and hatred. Most people are willing to dominate, but they dislike very much to have other people dominate over them. It is necessary therefore for those who set dominion as their ideal to prepare for defence. If they wish for supremacy, they must fight for it. They must have great armies and great navies, and, Professor Ashley contends, protective tariffs. Every nation but the English has a protective tariff. The time has come for her to resort to this weapon.

The case against free trade is very skilfully stated. To the wayfaring man, the arguments against free trade are, and always have been, convincing. If other countries tax goods sent to them from England, while England does not tax the goods sent to her by other countries, it seems clear that England is at a disadvantage. No doubt it is incorrect to assume, as some of the advocates of free trade have assumed, that the consumer of taxed goods pays the whole of the tax. The producer or seller of the goods must almost always pay some part of it. To a certain extent, therefore, England suffers from the tariffs of her customers. But do not her customers suffer more? That they do, free traders have frequently demonstrated, and Professor Ashley's case is weakened by his failure to attempt any reply to their demonstrations.

Much of his book is devoted to the task of proving that the exports of England are diminishing, and that such increase as they show is of a disastrous character. England's soil is robbed by the export of potter's clay, and her people are degraded by manufacturing for export clothing, furniture, oilcloth, soap, and jam. The increasing export of coal is described as a most alarming phenomenon. True, coal is consumed by English manufacturers; but this is a slow process. "The irony of the situation is rendered, if possible, more acute by the consideration that the smokeless steam coal so precious for naval purposes, which forms a large part of the coal export, is among the most important of munitions of war." It would seem to follow that the countries which supply England with food, with cotton, and with iron are rendering her a great service, and are on the road to their own ruin. There are actually Americans who remove fertilizers from the soil of their own country and sell them to enrich that of England. Our exports of petroleum are a far more monumental instance of national folly than the English exports of coal.

If Professor Ashley is alarmed by the exportation of coal, he is overcome with terror at the discovery of a conspiracy among the manufacturers of the United States and those of Germany to "dump" their products on the English market. Mr. Schwab and Mr. Gates are quoted as jauntily testifying that they sell their wares cheaper to Englishmen than to Americans. For more than a century, as our own protectionists have repeatedly warned us, Englishmen have been doing the same by us in spite of our tariffs; whence it might be inferred that customs duties were not a cure for this disease. Strangely enough, Professor Ashley does not mention the most frightful instance of all—that of the bounties paid by the Continental nations on the export of sugar. In consequence of this system, the English people have for many years been getting their sugar at half price, the difference being made up out of the taxes contributed by the people of France and Germany. Under these circumstances the industry of refining sugar has not flourished in England; to repeat Professor Sumner's classical epigram—"The Germans have the industry, and the English have the sugar."

This, according to our author, is a short-sighted policy—for the English. There may be some ephemeral gain in getting goods cheap. If Americans are willing to supply iron to Englishmen for less than cost, English manufacturers of ironware may receive a "temporary fillip." "But while the gain will be of doubtful duration, the loss by the destruction of the material-supplying industry will be profound, and will be widely demoralizing." This line of argument may sound plausible in England; we have heard it too many thousand times in this country to listen to it again with patience. Even to Englishmen the possible establishment of sugar refineries may not seem to justify increasing the cost of sugar to every family in England, though the objectionable industry of making jam for export be extinguished. It is not clear what industries Professor Ashley wishes to protect and what to destroy. His chief concern is that the trade unions should be favored; but if he prohibits the exportation of coal, the miners' unions would suffer. If he taxes the importation of cotton or of iron, similar results would follow. To propitiate Canada, he must tax the bread and meat of English workmen. He pleads that a small tax would not increase the price of bread; it would be paid by the foreign producer. But if the grain dealers of the United States should "dump" their surplus grain on the English market at the same price as before the tax was imposed,

the advantage to the Canadians is not apparent.

When he gets away from the uncomfortable subject of taxing bread, he becomes bolder. No half-way measures will be efficacious. "Duties of 50 or 75 per cent. *ad valorem* may be needed—or even prohibition." These duties may not be permanent; "if permanence can be avoided, it will be very desirable." But the matter cannot be left in the hands of Parliament. The Executive must be authorized "to impose the duties that may be required from time to time as the circumstances arise." We can imagine no more distressing situation than that of the English merchant or manufacturer under such uncertainty as this arrangement would cause. To be sure, the Executive is to be advised by a corps of professors of economics, after the fashion of the Germans, who shall constantly survey "every considerable branch of British trade and commerce—its condition industrially, technically, commercially," and furnish a parallel series of reviews of the industries of the other chief countries of the world. It does not seem worth while to consider this proposition seriously; practical men have not yet forgotten the dismal spectacle of a great body of English professors of economics chasing the *ignis fatuus* of bimetallism.

When it comes to explaining the part of the colonies under the new system, Professor Ashley treads very softly. As we have seen, he has to maintain that the English workman is not to pay more for his food, and yet to convince the colonists that they are somehow going to get more pay for supplying it. He must satisfy the woollen manufacturers of England that they are not to pay higher prices for their materials, and the Australians that they will sell these materials at higher prices. Even more delicate is the task of explaining to the colonists that they are expected to refrain from competing with English manufacturers. As these colonists are in the main bigoted protectionists, it will probably take some time to persuade them that "the main interest of the new countries now lies in the distribution of the population over the land and the maintenance of its physique by rural life." In this way the colonies will "avoid the evils of over-hasty industrialism." Since the whole scheme of imperial protectionism collapses unless the colonies take this view of their interests—which they will apparently not do before the Greek Kalends—the proposal to alter the policy of England seems premature. Recipes for hare soup are useless if the hare has not been caught; and if England cannot be a world empire until her colonies give up their protective duties, her citizens may well consider whether some other ideal may not be preferable to that of domination. Their great land—to quote William Watson's lines to Mr. Bryce—

> "Shall yet remember—she forgets to-day—
> How the munificent hands of Life are full
> Of gifts more covetable an hundred-fold
> Than man's dominion o'er reluctant man."

The Reminiscences of an Astronomer. By Simon Newcomb. Boston: Houghton, Mifflin & Co. 1903. 8vo, pp. 426.

Nobody will take up Professor Newcomb's blithe 'Reminiscences' in the expectation of social or political genre-pictures or revelations. The theatre of experience of a devoted researcher into an exact science is necessarily extremely narrow. It is doubtful whether he will have known even the chiefs in his own line so intimately as some less engrossed man or woman may have done. A student of science may find interesting information in the volume, as well as a cheery example when his task is discouraging, and a cheering voice when a great effort is to be made. The general reader will, for the most part, go to the book to learn something of that curious human variety, the great savant. Newcomb is quite the most distinguished man of science in this country to-day, as well as one of the most eminent in the whole world. His name will remain upon the page of scientific history, and eventually take its place high in the second rank, distinctly above Leverrier's or even Hansen's, because of the breadth of his work. He is one of the eight *associés étrangers* of the Paris Academy of Sciences. This is universally acknowledged to be the greatest public honor that can be conferred upon a non-French man of science. Newcomb is the first citizen of the United States to receive it (if we are right in thinking that Louis Agassiz never completed his citizenship). It has never yet been bestowed upon a native citizen of the United States, although Franklin and Rumford received it.

The unscientific as well as the scientific reader will find these memoirs entertaining. Such anecdotal books always make agreeable reading; and Newcomb's powers of telling a story and of painting a situation are much beyond the mediocre, while his light, pleasant style is quite remarkable. The two best chapters are the one that gives an account of the author's own work, and the one called "Scientific Washington." The brief notice of the Johns Hopkins University may also be singled out as better even than the rest; and it does justice to the singular faculty of Dr. Gilman, that university's only true begetter. The picture of the old Nautical Almanac Office in Cambridge from 1857 to 1861 is interesting, because that office bred a true school of mathematicians and philosophers, students mostly of Benjamin Peirce. As for scientific Cambridge as a whole, Newcomb was at that time not sufficiently developed, and as a consequence had not sufficient opportunities, fully to comprehend it. But perhaps the gem of the book is the account of his boyhood, a boyhood which, one can see, taught him much that was most valuable just because it did not teach him what he burned to know. It will afford the reader a lesson in human nature, too, by showing how apparently small a difference in his innate make-up would have converted this illustrious man, whose eminence is as little accidental as a man's can be, into an utter nobody, or even into an obscure little quack doctor of Nova Scotia. Young fellows will do well to ask themselves what was the ingredient of his character that saved him. Everywhere, the volume is pleasant reading. The author has shown a perfectly distinct apprehension of who might be interested in his reminiscences, and why, and has written it for them.

A History of Japan during the Century of Early Foreign Intercourse (1542-1651). By James Murdoch and Isoh Yamagata. Tokio: 10 Nishikata machi.

The work before us is one of the very few books on Japanese history which is based on original research, and written after long and laborious examination and comparison of documents and the weighing of evidence. Yet in its literary presentation it is hardly worthy of its great theme. It deals with that ever-interesting epoch in the world's history when the Japanese first knew and became known to Europeans, through mutual personal experiences, the interchange of products and the fruits of mind, and by embassies to and fro. Then the mighty onset of Western commerce and knowledge, and a terrific religious invasion, carried on with burning zeal and in the spirit of the Inquisition, threatened to destroy Japanese civilization and to bring the most Eastern of kingdoms under the intellectual and spiritual yoke of Southern Europe. Such a theme demands the highest literary expression, and a dignity of narration in harmony with the great events and personages described. One does not expect of the author any prepossession in favor of either Japanese or Portuguese, nor are we surprised at his aloofness of sympathy with the propagandists from Europe. Indeed, a cool, judicial spirit is exactly what we all desire in a historian; but the possession of even this excellence does not justify the author's use of slang and some decidedly low forms of the English language in treating of what he dislikes—a method which suits better a sensational newspaper than a dignified history.

Yet these faults are on the surface. After noticing them, it is only common justice to call attention to the great value of this work of more than 700 pages, which is indexed and has a rich equipment of colored maps. These show, as does no other work we know of, outside of the native literature, the feudal divisions of Japan in the times of Nobunaga, Hideyoshi, and Iyeyasu. The battle plans are remarkably accurate and informing. An introductory chapter gives an admirable bird's-eye view of the history until the year of the arrival of foreigners. Two or three things Mr. Murdoch, who has lived many years in Japan, brings out clearly. One is that the rigid lines of demarcation between the samurai, or the warrior class, and the farmers, artisans, and merchants, so characteristic of society since 1600, were by no means strict in the old days. Any plebeian who could prove himself a good fighter was willingly received under the flag of a feudal potentate. So far from being a caste of hoary antiquity, at least as evidenced in the wearing of two swords, it was not until the last half of the sixteenth century that this privilege was reserved only to the samurai.

What makes the period treated by Mr. Murdoch so interesting to students, and most like the time spanned by the life of the present Mikado, is, that men of real ability, instead of crafty wire-pullers behind imposing figureheads, ruled the country. Japan's chronic disease during most of her history has been nepotism, and she has suffered from the ascendency of rings and cliques; but in the sixteenth, as in the nineteenth, century, these were ruthlessly broken up. Men of real genius obtained control of national affairs, and they insisted upon the promotion of their subordinates who made devotion to duty

their first consideration. In the last analysis, it may be said that the reason why the Yedo bureaucracy, that dominated the country from the death of Iyeyasu to the rise of native genius and energy in the southern clans and the *coup d'état* of 1868, was able to hold its own so long, lay in the expressed purpose of the great founder to create a system of government which could be administered by men of mediocrity.

Mr. Murdoch, in his chapter on the Portuguese discovery of Japan, disposes of the pleasing fiction that the pious and mendacious Pinto was the first European on Japanese soil. He is very vivid in picturing Xavier's movements and the spread of Christianity in Kiushiu. He holds the threads clearly in narrating the story of the three great men of Japan, and many of his pages are brilliant and fascinating. Nobunaga patronized the Jesuits, setting them against the bonzes, and enjoying the sport of their conflict as he would that of two fighting-cocks in a pit, and then finally crushed the Buddhist hosts—armies in fact, with reality of helmet, armor and weapons, as well as armies in name. In showing how Nobunaga rose and fell, and how Hideyoshi entered into his predecessor's labors, but with profounder genius, keener insight, vaster ken, and even greater energy, the author depends on no unscrutinized tradition or unchallenged legend. We make bold to say that, although other scholars have been fascinated by the same theme and have treated of this mighty parvenu, who, coming out of a stable, humbled the proudest of the many rings and cliques of nobles that hedged about the throne against the people, there is no picture of his personality, actions, and measures like that here presented. Furthermore, we venture to think that, without the coöperation of his Japanese helper, this picture of Mr. Murdoch's could not have been made so clear and strong. As in a stereoscope, the two differing mental projections, European and native, are brought into a common field of vision, with both relief and solidity.

The chapter on the Korean war (1592-1597), in which the Japanese swept the peninsula clean of its art and art works, has especial freshness, since Prof. H. M. Hulburt's Korean researches are here well utilized. With his usual critical challenge to popular impressions, Mr. Murdoch explodes the idea that the sea-power of the Koreans, which sadly upset the plans of the invading Japanese, extended as far as iron-clads. He believes that the famous "tortoise boat" which sunk the Japanese war junks was not iron-plated, but received its chief offensive power because of its swiftness and superior artillery. The author sets more store upon the great Osaka struggle (1614-1615) than upon the battlefield of Sekigahara, as the decisive event in forecasting the destinies of Japan for over two centuries. He treats of the Tokugawa administrative machine in a chapter which, while illuminating, leaves considerable to be desired. He shows how clearly Iyeyasu foresaw that in time of luxurious peace few of his descendants were likely to be men of any very marked ability. Of the Portuguese and Dutch; of the revolt at Shimabara, in 1637, which he considers, in its animus and procedure, to have been almost wholly Christian; of the expulsion of the Portuguese, and the Dutch at Deshima; and of internal affairs immediately after 1616, the author writes clearly, and shows a strong grasp of his many-sided subject.

We understand that another volume is to follow, for which we can assure a very warm welcome from scholars. If for no other reason than to correct the manifold and variegated errors in previous works on Japanese history, all libraries of any importance in Occidental countries should possess this work.

Sevastopol, and Other Military Tales. By Leo Tolstoy. Translated by Louise and Aylmer Maude. Funk & Wagnalls Co. 1903. Pp. xlviii., 325.

This volume is the first of a series which is intended to be "a reliable version of all Tolstoy's works." The translators belong to a small but enthusiastic minority who regard Tolstoy's religious and philosophical tenets as of more importance to the world than his artistic creations. They are in sympathetic personal relations both with Tolstoy himself and with his friend Vladimir Tchertkoff, who publishes in England the authorized Russian editions of the works of Tolstoy that are under the ban of the censorship. They state that they do not wish to earn money by their translations; and they evidently regard this edition as the fulfilment of a moral obligation.

On a cursory examination, this opening volume seems superior both in accuracy and in English style to the versions of the same tales hitherto most readily accessible in America. The versions of the more important novels will furnish a firmer basis of comparison. The present volume is well printed on good paper, and is not expensive. Besides this, Mr. Maude states in his preface: "It is hoped to reach the many readers who can only afford cheap books, by reproducing these translations at a low price in the second year of their issue." The notes are good, and at the close of the volume there is a useful index referring to them. In a word, the execution of this volume and the plans for those to follow show conscientiousness and competence for the task undertaken. Though few people will sympathize entirely with the tone of Mr. Maude's preface, this book gives great cause for rejoicing to those who care for Tolstoy. Let us hope that the present translators will be able to do more than "lay the foundations" for their edition.

Some "patriotic" sentences are omitted from 'Sevastopol,' though they appear in the Moscow edition. For the omission Mr. Maude has authority from Tolstoy, who writes: "All [these passages] were either altered or inserted by the editor [of the magazine in which 'Sevastopol' first appeared] to meet the wishes of the censor." At a distance of almost fifty years, and after many mental and spiritual revolutions, Tolstoy's memory may deceive him. Such things have happened with other authors. He may even have written the "specially abominable" passage: "It is a comfort to think that it is not we who began this war, that we are only defending our own country, our Fatherland." In such cases it would be better to retain the offensive passages in brackets, or at least to give a full list of them.

Bryant's Complete Poetical Works. Roslyn Edition. D. Appleton & Co. 1903.

It is now more than twenty years since Mr. Parke Godwin, the son-in-law and biographer of the poet, published in two bulky quartos his definitive edition of Bryant's verse. That in all this time there has appeared no convenient reissue of it in a single volume, though it left nothing to be desired in text, notes, and arrangement, is proof enough, if evidence were wanting in other quarters, of the decay into which has fallen the first considerable representation in American literature. "Bryant is a fading and almost Ossianic figure, a writing ghost, to most of us," writes Mr. Woodberry in a recent essay; and the fact, if not the implied criticism, seems incontestable. Longfellow, the only other American poet who has ever compared with Bryant in general popularity, has appeared in edition after edition, and the publishers seem to be unable to supply him in forms varied enough to meet the public demand. Bryant, on the other hand, who at one time enjoyed a singleness of reputation such as has been acquired by no other native poet, has long been easily accessible only in the old and incomplete Household Edition prepared by himself two years before his death, and in reprints of still earlier editions even less complete.

At last, however, we have the new Roslyn Edition, a collection that comprises in a single volume all the verse that Bryant ever wrote. But though it is complete and convenient, it is still far from being satisfactory. It seems inexplicable that in its preparation some use, at least, should not have been made of Mr. Godwin's editorial labors. His text, notes, and arrangement, preceded by a Memoir based upon his biography, would have made an ideal edition. That so sensible and logical a plan was not followed is apparently due to the fact of there having been no editorial supervision of the work as a whole. The late Mr. R. H. Stoddard contributes a memoir, somewhat sketchy and inaccurate, and Mr. H. G. Sturges a complete chronology of the events of the poet's life with an admirable bibliography of his work; but neither one nor the other nor any one else appears to have had anything to do with the body of the book, which, except for the addition of the fifty-odd poems first included by Mr. Godwin in his edition, is merely a reprint of the old Household Edition. In view of this fact, the "Note to the Reader," in which it is stated that the poems are arranged in the order in which they were written, is false and misleading. This is the arrangement adopted, very wisely, we think, from every point of view, by Mr. Godwin, who also placed after each poem the date of its composition. In the Roslyn Edition, however, the poems are given as they were arranged by Bryant himself, in the interest, presumably, of what he considered an effective presentation, so that "The Ages" precedes "Thanatopsis" as the first poem in the volume—a precedence which it deserves on the grounds neither of time nor of merit.

With respect to the text, we notice the failure to follow Mr. Godwin's lead in at least one important particular. The second stanza of "The Waterfowl" reads or should read:

> "Vainly the fowler's eye
> Might mark thy distant flight to do thee wrong,
> As darkly painted on the crimson sky
> Thy figure floats along."

Bryant was always dissatisfied with the word "painted," which he felt to conflict with the idea of floating in the line following; but, although he tried several expedients, he never succeeded in improving the sense without injuring the poetry. In the last edition, he changed the line to read:

"As seen against the crimson sky,"

which, as Mr. Godwin remarks, is tame, and weakens the effect. Bryant himself finally restored the line to its first form in several later instances where the poem was to be printed separately. Mr. Godwin did likewise, and there now seems to be no reason why any editor with a sense of Bryant's style should not adopt his precedent.

For notes, the Roslyn Edition has only Bryant's few explanatory remarks. Mr. Godwin added many others of a personal and critical interest, but none of them is retained except his list of the various readings of certain lines of "Thanatopsis," which are given by Mr. Sturges in the bibliography.

Apart from these matters, what one misses most in the volume is an adequate estimate of Bryant's genius and place in American literature. If Mr. Stoddard's memoir on the biographical side is sketchy and inaccurate, it is even less satisfactory when it touches on the work of the poet. Here if ever there was an opportunity to attempt a rehabilitation of Bryant's reputation. But, instead of a sympathetic and discriminating effort to meet the charges of those who see in Bryant only the sentimental and didactic poet, the servile imitator of Wordsworth, there is only vague and general characterization which passes into a vein of extravagant eulogy. "We should like to know what lines in Southey and Kirke White suggested 'Thanatopsis' that they might be printed in gold hereafter," writes Mr. Stoddard in one place; and in another, praising him at the expense of Wordsworth: "'The Excursion' is a tiresome poem, which contains several exquisite episodes. Mr. Bryant knew how to write exquisite episodes, and to omit the platitudes through which we reach them in other poets." Such lack of proper perception and of real appreciation disqualified Mr. Stoddard for the task of reintroducing Bryant to a new generation of American readers, who are at least as likely to be prejudiced against him by an excess of injudicious and uncritical warmth of enthusiasm as by the narrowly depreciatory tone of a critic like Mr. Barrett Wendell, for whom Bryant is merely a provincial English poet, expressing "a somewhat formal sentimentality which had hardly characterized vital work in England for fifty years." Of course, Bryant is much more than this. He is an American poet, whose native inspiration is so imaginatively and sincerely expressed that it is of little consequence in what school his style was formed. Yet, on the other hand, he is no Wordsworth; and although we may sometimes call him the "American Wordsworth" by way of expressing what we feel to be our indebtedness to him for having rendered romantic with poetic assocaition our native landscape, he is not for one instant seriously to be compared with that great poet-philosopher whose impress is on all English poetry since his time. It is not merely that there is in Bryant's poetry none of Wordsworth's mystic pantheism. There is, to offset this, Bryant's expression of the religious ideals of Puritanism. It is rather that, compared with Wordsworth, Bryant brings to the imaginative interpretation of nature a much smaller capacity of mind and heart. Wordsworth may often indulge in platitudes, but his "exquisite episodes" are profound revelations of spiritual truth; whereas in Bryant, no matter how fresh or delicate or piety-felt his expression, there is almost inevitably a touch of the obvious and commonplace. There can be no doubt that it is this want of either intellectual depth or originality that is the real source of weakness in Bryant's poetry.

BOOKS OF THE WEEK.

Barnard, L. F. S. Friends Hither and Yon. (Verse.) Boston: Richard G. Badger. $1.

"Mrs. Bancroft was a brilliant woman, and all her life was associated with people of distinction." —Brooklyn EAGLE.

Letters from England

1846-1849

By MRS. GEORGE BANCROFT

With twenty-four full-page illustrations. Crown 8vo. $1.50 *net* (postage extra)

"Remarkably attractive."
—Chicago JOURNAL.

SOME OF THE SCENES

A Voyage to England in 1846
Liverpool and Its People
Social and Other Contrasts
A Trinity College Celebration
A Children's Masque
Richmond Park & Kew Gardens
A London Dinner
A "Court Day" in 1847
A Drawing-Room
At the Covent Garden Opera
A Dinner at Buckingham Palace
A Day with Lady Byron
Hampton Court
The Queen's Birthday
The Queen's Ball
Audley End

EVERYONE who enjoyed Madame Waddington's "Letters of a Diplomat's Wife" will be interested in this new collection of letters written by Mrs. George Bancroft, the wife of the historian, during her husband's ministry to the Court of St. James from 1846 to 1849. The letters were written by a remarkable woman and give a picture of a remarkable period. Most of them were in the form of a journal addressed to members of Mrs. Bancroft's family, and they are full of personal ideas and opinions concerning people in the literary and artistic world and in the intimate social and court life into which the writer's position introduced her. Her life seemed to her more like a drama than a reality, and like a drama her letters all read—vivid, picturesque, and spontaneous.

"Lively and entertaining observations of men and things."—Minneapolis JOURNAL.

"Of uncommon interest."
—N. Y. TIMES.

Another Volume of
LITERARY LIVES
With 17 illustrations $1.00 *net.* (postage 10 cents.)

CARDINAL NEWMAN

By **William Barry D.D.**, Author of "The New Antigone," etc.

CONTENTS

Early Years
The Tractarians
First Catholic Period
Apologia Pro Vita Sua
The Logic of Belief
Dream of Gerontius
The Man of Letters
Newman's Place in History

"In one thing," writes Dr. Barry, "Newman tar surpassed Wesley; he was a man of letters equal to the greatest writers of prose his native country has brought forth."

ELECTRICITY AND MATTER

By J. J. Thomson, D.Sc., LL.D., Ph.D., F.R.S., Professor of Experimental Physics, Cambridge. With diagram, $1.25 *net* (postage 11 cents).

In this volume the author, who is recognized as the highest authority in England on Physics, discusses the bearing of the recent advances in Electrical Science made by the discovery and study of Cathode and Roentgen Rays and Radio-active substances on our views of the constitution of matter.

OVERTONES: A Book of Temperaments

By **James Huneker,** author of "Mezzotints of Modern Music," etc. With frontispiece portrait of Richard Strauss, 12mo, $1.25 *net* (postage 12 cents).

CONTENTS:—Richard Strauss; Parsifal: A Mystic Melodrama; Literary Men Who Loved Music: Balzac, Turgenieff, Daudet, etc.; The Eternal Feminine; The Beethoven of French Prose; Nietzsche the Rhapsodist; Anarchs of Art; After Wagner—What? Verdi and Boito.

A New Book by
MERRIMAN

TOMASO'S FORTUNE: And Other Stories

By **Henry Seton Merriman,** author of "Barlasch of the Guards," etc. 12mo, $1.50.

The late Henry Seton Merriman left at his death a volume of nearly a score of short stories which possess in an unusual degree the qualities that have made his novels acceptable to a multitude of readers. The book shows Mr. Merriman the master of the art of the short story as well as the novel.

KOREA

By ANGUS HAMILTON
Illustrated. $1.50 *net*

"A timely book, a well-considered, matured and informing work by a man who knows the country from end to end and can put pictures on paper with consummate ease."
—*London Academy.*

Completion of the Definitive Edition of

THE WORKS OF LORD BYRON

A New Text, collated with the Original MSS. and Revised Proofs, which are still in existence, with many hitherto unpublished Additions. Edited by ERNEST H. COLERIDGE, and ROWLAND E. PROTHERO, M.V.O. With Portraits and Illustrations. 13 vols., each $2.00.

THE LIFE OF EDWARD FITZGERALD

By THOMAS WRIGHT. With many illustrations. 2 vols., 8vo, $7.50 *net.*

It contains a great amount of new matter, and many unrecorded anecdotes, and throws new and interesting sidelights on the life of this great letter-writer and fascinating man of genius, whose work is becoming better known and more appreciated every year.

The TEST

By MARY TAPPAN WRIGHT.
12mo. $1.50.

A powerful novel of contemporary American life by a writer of very individual and original talent. The singular intensity and power to move, shown repeatedly in "Aliens," are here at their strongest, and the situations in "The Test" are such as to call out all Mrs. Wright's exceptional literary art.

LEADING NEW TEXT-BOOKS

Gateway Series of English Texts

General Editor, **Henry van Dyke** Princeton University.

Cloth, 16mo. Eighteen volumes.

This series will include all the College Entrance Requirements in English. The books are convenient in form, attractively and substantially bound, reasonable in price, and printed from clear type. The notes treat of difficulties in the text, allusions and references and points of construction. The editing of the volumes is carefully and judiciously done.

Fisher's Outlines of Universal History Revised Edition $2.40

By **George Park Fisher,** D.D., LL.D., Professor in Yale University.

Also in three parts. Price, each, $1.00.

A careful revision of this well-known work, including whatever amendments are called for by recent historical investigation. The bibliography connected with the successive periods has been modified to meet present needs. The history has been brought down to the beginning of the twentieth century.

Morey's Outlines of Greek History = = $1.00

By **William C. Morey,** Ph.D., Professor in the University of Rochester.

Gives special attention to the growth of civilization, in art, literature and government. Points out clearly the essential facts of Greek history and shows its influence on subsequent events. It contains also a survey of Ancient Oriental Nations. Clear and well balanced, interesting and readable. Supplied with numerous helpful notes and illustrations.

François' Beginner's French = $0.65

By **Victor E. François,** Instructor in French, College of the City of New York.

This book enables teachers to use French in their classes from the very beginning. Each of the 49 lessons contains brief statements of rules, short French texts, exercises in transposition, questions, grammar drill, and English sentences and passages for translation into French. The recent official changes in the French orthography are incorporated.

Rolfe's Shakespeare Revised Edition

Edited by **William J. Rolfe,** Litt.D.

Cloth, 16mo. Forty volumes. Each, 56 cents.

This most popular edition of Shakespeare has been thoroughly revised and reset in new size. The page is made smaller to adjust the volumes to pocket use. The notes have been carefully gone over and many new helps to the student are included. This new edition reflects the present state of Shakespearean criticism.

Moore's Cicero de Senectute = $0.80

Edited by **Frank Gardner Moore,** Ph.D., Associate Professor of Latin in Dartmouth College.

An important edition, embodying much new critical material. The text is supplied with very full footnotes, and is accompanied by a scholarly introduction in which the character of Cato is elaborately set forth. The appendix contains critical and supplementary notes, an index of persons, and a general index to the notes.

Dresden's German Composition = $0.40

By **B. Mack Dresden,** A.M., Instructor in German, State Normal School, Oshkosh, Wis.

This meets the demand for continuous prose material for translation into German. The book is the result of much thought and experience with classes in this subject. In it the author has embodied those ideas and methods which he has employed with great success with his own pupils.

Monsanto & Languellier's Practical Course in Spanish. Revised Edition = = $1.25

Revised by **Freeman M. Josselyn, Jr.,** Assistant Professor of Romance Languages in Boston University.

For many years one of the most successful Spanish grammars before the public. The revision embodies the new rules of accentuation promulgated by the Spanish Academy. The original form of the work has been retained so far as possible, but such grammatical statements as needed change have been recast. The Spanish text is presented in accordance with the latest rules for orthography.

Pearson's Latin Prose Composition = $1.00

By **Henry Carr Pearson,** A.B. (Harvard), Horace Mann School, Teachers College, New York.

Combining a thorough and systematic study of the essentials of Latin syntax with abundant practice in translating English into Latin, this book affords constant practice in writing Latin at sight. It is complete in itself and meets the most exacting college entrance requirements.

Lane's Latin Grammar Revised Edition $1.50

By **George M. Lane,** Ph.D., LL.D., Professor Emeritus of Latin, Harvard University.

Distinguished for completeness, convenience of arrangement, accuracy of detail, and precision of expression. Combines condensation with clearness. No law of the language is neglected, no exception forgotten. In the revision by Professor Morris H. Morgan of Harvard University, many changes and corrections have been introduced.

Modern Language Texts

During the last year fifteen new volumes have been added to the series of modern readings in French, German, and Spanish. These texts now number over eighty-five. They are supplied with helpful notes and adequate vocabularies, and include the entrance requirements for modern language reading of the principal colleges. Complete lists and detail descriptions will be sent to any teacher.

Gleason's Greek Primer = = $1.00

By **Clarence W. Gleason,** A.M. (Harvard), Roxbury High School, Roxbury, Mass.

This book can be completed in less than a school year. The verb is developed slowly and naturally, with the second aorist to the fore. The number of lessons is great, and gives much practice in verb forms. Infinitive and participle and indirect discourse are treated at length.

An Illustrated Descriptive Catalogue of High School and College Text-Books will be sent without charge to any address on request. Correspondence is cordially invited and will be promptly and cheerfully answered.

AMERICAN BOOK COMPANY

New York Cincinnati Chicago Boston Atlanta Dallas San Francisco

THE NEW EDITION OF

Chambers's Cyclopaedia of English Literature

TREATS OF **1216** WRITERS NOT MENTIONED IN ANY WORK OF A SIMILAR CHARACTER IN THE ENGLISH LANGUAGE. IT CONTAINS **852** MORE PAGES THAN ANY OTHER WORK OF ITS KIND. WE WILL BE GLAD TO SEND TO ANY ONE INTERESTED FULL DESCRIPTIVE CIRCULAR SHOWING SAMPLE PAGES.

COMPLETE IN THREE IMPERIAL OCTAVO VOLUMES

Illustrated with approved portraits and drawings. A detailed Table of Contents in each volume. Library Bindings. Price, $15.00, net, per set. Carriage extra.

OPINIONS OF THE PRESS

"As it now stands completed in three generous volumes, this revised edition of 'Chambers's Cyclopædia' must be reckoned easily the most generally serviceable manual of English literature obtainable."—*N. Y. Nation.*

"One of the completest expositions and commentaries upon the entire body of English literature which have ever been presented."—*N. Y. Times Sat. Review.*

"The house of Lippincott deserves the thanks of American scholars and readers for presenting this admirable work in so satisfactory a manner."—*Brooklyn Daily Eagle.*

"A library in itself, and deserves a place in every household as well as in every ambitious collection of books."—*Bulletin, San Francisco, Cal.*

Graded Supplementary Reading Series

The aim of the publishers in issuing this new series has been to meet the requirements of classes in supplementary reading for the primary grades. While the books are interesting in matter and beautiful in mechanical make-up, they excel especially in their teaching features. Above all, the grading is as scrupulously considered as in any regular series of readers.

The following books are now ready:

Classic Fables
For Advanced First Reader Grades
Selected and Edited by EDNA HENRY LEE TURPIN.
127 pages. Cloth. Price, 30 cents.

Grimm's Fairy Tales
For Advanced Second Reader Grades
Selected and Edited by EDNA HENRY LEE TURPIN.
207 pages. Cloth. Price, 40 cents.

In Press

Andersen's Fairy Tales
For Advanced Third Reader Grades
Selected and Edited by EDNA HENRY LEE TURPIN.

International Law

By W. E. HALL

Fifth Edition. 8vo. $6.00

This new edition of this well-known treatise has been edited by Mr. T. B. Atlay, and new matter has been introduced in order to bring the book down to date. Events in Japan and China, the Venezuela boundary dispute, the Hague Conference, with its various conventions, together with incidents in the Spanish-American war, and the war in South Africa are among the topics which have demanded Mr. Atlay's notice.

A School Principal's Opinion:

"I am pleased to say we are highly satisfied with them. Typography, binding, paper combined make these volumes almost ideal for class use. Kindly send me a copy of your catalogue so that I may learn what other volumes you publish in the same series."

The Astor Prose Series

The BEST BOOKS

in all prose literature, printed on good paper and neatly bound, with frontispieces and title-pages printed in two colors. Cloth, assorted colors. 261 volumes, 12mo.

Per volume, 60c. Price to schools, 40c.

"The best books for the money published in England or America."—FROM A CUSTOMER.

Shakespeare's Works

"First Folio Edition," Edited, with Notes, Introductions, Glossaries, Lists of Variorum Readings, and selected Criticisms, by CHARLOTTE PORTER and HELEN A. CLARKE, Editors of the "Camberwell" Edition of Robert Browning.

To be completed in 40 handy volumes, size 4¼x6¼. Sold separately. Cloth, *net* 50 cents; limp leather, *net* 75 cents. (Postage, 5 cts)

The following volumes are ready:

A MIDSOMMER NIGHTS DREAME
LOVES LABOUR'S LOST ***The*** **COMEDIE OF ERRORS**
THE MERCHANT OF VENICE

". . . I am convinced that these editors are the best equipped among us all for the beautiful yet arduous labor which they have taken in hand. The plan is mature and satisfying; it is what editing should be, or what, more's the pity, it so often is not."—EDMUND CLARENCE STEDMAN.

THOMAS Y. CROWELL & CO., 426-8 West Broadway, New York

GEORGE FOX:

An Autobiography

Being the Story of his Life as told in Selected Passages from his Journal. Edited, with Notes and an Introduction, by RUFUS M. JONES, M.A., Professor of Philosophy in Haverford College.

Two volumes, 12mo, cloth, gilt top, with maps of his journeys in England and America, and numerous illustrations. Postpaid, $4.00 *net.*

Students' Edition, in one volume, without the illustration. Cloth, postpaid, $1.50 *net.*

PRESS NOTICES

". . . We have in the two volumes before us a really valuable missionary labor, which is bound to bear fruit. It will open the pages of this unique record of spiritual experience to many who would never read it otherwise, and so help to a better understanding of the great movement of which George Fox was the central figure."—*Philadelphia Ledger*, January 17, 1904.

". . . In the transcription of the Journal . . . Dr. Jones, by careful and judicious editing, has produced a continuous narrative. It is a dramatic story. . . . Expunging the multiplicity of theological discussions with which Fox himself interspersed his narrative, the editor has reserved the personal narrative alone, which shows us forth George Fox himself, in his own day, and in his own historical setting. . . . The copious footnotes and the frequent illustrations add much to the charm of an already charming work."—*Boston Evening Transcript*, February 17, 1904.

". . . The abridgement and editing are by Rufus M. Jones, professor of philosophy in Haverford College, who, though evidently himself one of 'the people called Friends,' makes no exorbitant claim for Fox, and in his notes and introduction exhibits a degree of detachment that deserves remark and praise. . . . The introduction is happily conceived, and the notes convey, in almost every case, information that illuminates the text. This appears to have been abridged from the edition of 1694 in a judicious manner."—*The Nation*, March 3, 1904.

THE INDEPENDENCE OF THE SOUTH AMERICAN REPUBLICS

A Study in Recognition and Foreign Policy

By FREDERIC L. PAXSON, Assistant Professor of History in the University of Colorado, and sometime Fellow in the University of Pennsylvania. 12mo, cloth. $2.00 *net.*

"The title to this excellent little volume gives its intention and scope, and Mr. Paxson has, with rare restraint, confined himself strictly to his subject. . . . [He] outlines clearly the rise of a doctrine of recognition, and as clearly recounts the events passing in South America which led to the revolt against Spain and eventually to independence. . . . His study is based upon original resources. . . . Mr. Paxson has justly emphasized the influence of John Quincy Adams."—WORTHINGTON C. FORD in *American Historical Review*, January, 1904.

"This little book, which reviews comprehensively and brilliantly the inception and culmination of the revolts of the Spanish colonies in the Southern continent, is especially timely to-day."
—*Boston Transcript*, September 2, 1903.

"Mr. Paxson has done one signal service in bringing out the fact that even more completely than has been surmised, John Quincy Adams was the real head of the Monroe Administration, and was the real power behind the throne as regards the Monroe Doctrine. Furthermore, the author shows that the Monroe Doctrine itself was in process of formation for many years before it was enunciated in 1823. Finally, the present study throws new light upon the rivalry between John Quincy Adams and Henry Clay. Thus we have a work which will attract the immediate attention of every student of American history, and the attention will be well repaid." —*The Outlook*, August 29, 1903.

FERRIS & LEACH, Publishers, PHILADELPHIA

BOOKS OF PERMANENT VALUE

The Philosophy of Auguste Comte

By L. LEVY-BRUHL, of the University of Paris, authorized translation with an introduction by Frederic Harrison. 8vo., *net*, $3.50.

"He has done the thinking world a signal service. He gives us in a style conspicuously lucid, in a single volume of moderate size, the salient features of the French philosopher's message, and thus in every sense puts it within the reach and means of the many."—*N. Y. Times Sat. Review.*

The Society of To-morrow

A Forecast of its Political and Economic Organization. By G. de MOLINARI, Correspondant de l'Institut, and Editor-in-Chief of "Le Journal des Economistes," with an Introduction by Hodgson Pratt.

With an Appendix of the Cost of War and Preparation for War in the United States, 1898-1904. By EDWARD ATKINSON. 8vo, *net.* $1.50.

A valuable work treating of the moral, political, and social dangers which menace human society, and of the best way of dealing with them.

CHRISTOPHER COLUMBUS

His Life—His Work—His Remains. By JOHN BOYD THACHER, author of "The Cabotian Discovery," etc. 3 Vols. Royal 8vo, 300 plates (Portraits, Facsimile Manuscripts, Views and Maps), per set $27.00. Vol. III completing the work *ready.*

"The most complete presentation of the story of Columbus."—*Brooklyn Eagle.*

AMERICAN POLITICS

I. The American Republic and Its Government

An Analysis of the Government of the United States, with a Consideration of Its Fundamental Principles and of Its Relations to the States and Territories.

"A sounder or more useful commentary has never before seen the light Even Mr. James Bryce's study of the 'American Commonwealth' must on the whole be deemed less fruitful. Not a single page should be overlooked."—M. W. HAZELTINE in the *N. Y. Sun.*

II. Political Parties and Party Problems in the United States

A Sketch of American Party History and of the Development and Operations of Party Machinery, together with a Consideration of Certain Party Problems in their Relations to Political Morality.

"Exceptionally clear, interesting, and impartial. A lucid explanation of the workings of party machinery, and a strong statement of the moral evils now debasing our political life, and the remedies which an awakened public conscience may apply. A thoroughly good book for the school and for the study."
—*Outlook.*

By JAMES ALBERT WOODBURN, Professor of American History and Politics, Indiana University.

Two volumes, sold separately, each complete in itself and indexed. Each, net, $2.00. (Postage, 20 cts.)

NEW YORK **G. P. PUTNAM'S SONS** LONDON

American Art for School Rooms

The work of American artists has won throughout the world abundant appreciation of its distinction and accomplishment, in portraiture, landscape, symbolical painting, and mural decoration. But in the selection of subjects for the adornment of the walls of school rooms, its value as an educational influence, although not overlooked, seems not to have been fully perceived. It is, to be sure, difficult to choose pictures wisely for this purpose, for the considerations affecting a choice cannot be limited to mere questions of good art and representative periods, — although even on this ground alone American art should be more fully represented in schools than it is. Will a proposed picture interest the boys and girls that are to see it day in and day out? Will they understand it or care whether they understand it? However good the art, if it does not interest the pupil, bare walls, well tinted, would serve as well. This is not to imply that classical or mediæval art should be ignored in schools, but it is true that many examples of it, although excellent in some aspects, fail of effect because they speak a language that our boys and girls do not understand, — because they are painted with feelings and sympathies that are not the feelings and sympathies of American boys and girls of the present day. In European art Justice used to be represented with her eyes bandaged. Edward Simmons paints a Justice for a New York court with eyes unbound and showing clear vision. To a man who asked him why he had thus departed from tradition in this symbolical figure, Mr. Simmons replied, "I think Justice should have her eyes wide open, particularly in the New York Criminal Court House." Which of these two conceptions of Justice will appeal most to the pupils of a school? Examples of independent thought and fresh insight on the part of American artists can easily be multiplied. Our American art is, indeed, full of human vitality, is inspiring in its themes, and speaks the language of our own time. Our boys and girls, with masterpieces of European art before them, should, it is submitted, have at least an equal opportunity of acquaintance with the representative works of American art.

To provide such works Messrs. Curtis & Cameron, whose house has for so many years stood as the one art publishing house distinctively representative of American art, have developed their facilities for the extra large sizes required for proper effect on school room walls. The increase in size over the standard sizes of their Copley Prints is by what is known as bromide enlargement, and the effect is highly satisfactory, both in standard gray and in sepia tone. A special descriptive list of school subjects, fully illustrated, is sent upon receipt of 10 cents; stamps accepted.

The attention of all readers of this announcement — apart from the matter of school decoration — is particularly invited to the ILLUSTRATED CATALOGUE of Copley Prints, which is quite out of the class of ordinary catalogues. It contains illustrations of upwards of 200 paintings, substantially all of which are otherwise obtainable only in the Copley Prints. The most distinguished American artists are represented; for example, the illustrations include Edwin A. Abbey's entire frieze of the *Quest of the Holy Grail* in the Boston Public Library; John S. Sargent's complete mural decorations in the same building; Augustus St. Gaudens's *Shaw Memorial* and Sherman statue; landscapes by George Inness; Elihu Vedder's Lazarus, Samson, Cumæan Sibyl, and others; works by W. M. Hunt, John LaFarge, Daniel C. French, Kenyon Cox, Edward Simmons, Abbott Thayer, Edwin H. Blashfield, Winslow Homer, and so on. This Catalogue is sent upon receipt of 15 cents in stamps.

The Copley Prints are excellent for gifts, and for the further adornment of one's own walls. They may be obtained of the leading art dealers throughout the world. The publishers, however, fill orders direct if desired, and are especially glad to send to persons to whom the art stores are not readily accessible. Appreciating the difficulty of selecting prints without first seeing the subjects, the publishers also send "on approval" to intending purchasers. Upon such orders within the United States the publishers pay the mail or express one way; both ways if prints are retained to the amount of $5.00.

As to the quality of these Prints, they have for years been recognized as the best art reproductions made in America. They received the highest award gold medal at the Paris Exposition of 1900. Mr. Abbey, referring to the prints of his *Holy Grail*, says, "It gives me much pleasure to testify to the excellence of the Copley Prints. Those that have been published reproducing my own work, I could not wish bettered." Mr. Sargent writes, "I have pleasure in expressing my opinion of the excellence of your Copley Prints."

The Copley Prints

Complete Illustrated Catalogue, 15 cents (stamps). Above picture copyright, 1895, by Edward Simmons; from a Copley Print copyright, 1896, by

Curtis & Cameron, Publishers *9 Pierce Building Opp. Public Library* *Boston*

The Nation.

NEW YORK, THURSDAY, MARCH 31, 1904.

The Week.

The President is displaying his usual belated sensitiveness after a rash act—this time in connection with his pension ruling. He has found out that it is of doubtful legality and of an unpopularity not at all doubtful; consequently he is about to rise to explain, so the Washington dispatches inform us. Certain precedents are to be cited, it appears, but the chief defence is that this lesser evil was accepted only to avoid a greater. That is to say, the movement for a general service pension act was getting to be formidable. Congress felt itself too weak to withstand it; the heroic President himself distrusted his own ability to oppose a demoralizing and ruinous measure. So the plan was devised of squandering $14,000,000 in order to prevent the squandering of $80,000,000. The idea that it is the duty of the Chief Executive to prevent all squandering is, of course, obsolete. So, apparently, is also the proverb that, if you give certain people an inch, they will take an ell. Certainly, the sop which the President has thrown to the pension lobbyists will, instead of satisfying them, only whet their appetite for more.

That blessed word Mesopotamia is nothing to "administrative entity." By grace of it, Secretary Hay is able to remain perfectly calm although the American flag is hauled down at Niu-Chwang, under the declaration of martial law by Russia. This would be a deadly insult except for a soothing application of the "entity." All we have to do is to say that we never did think Niu-Chwang a part of either entity or quiddity, and that lets us out. But this grateful calmness at Washington is only a part of a large peacefulness of temper which the impending Presidential election has suddenly imposed on the Administration. It is no longer "policing" San Domingo nor "showing a firm front to Russia." The President's advisers having warned him that another indiscretion in foreign affairs would be fatal to his electoral prospects, he is—for the time being—the meekest and most long-suffering of men.

Admiral Dewey's failure to land in San Domingo had a queer look. There was some desultory firing on shore, but what was that to the hero of Manila? This is to say nothing of his companion in arms, "Loomis, Acting," who, as everybody knows, is ready to eat foreigners alive. But the lame explanation, telegraphed from Havana, is now, however, superseded by a more plausible account. It seems that the doughty Admiral was not aware, until he reached Dominican waters, that our Minister to the black republic is himself a negro. Imagine, then, the consternation on Dewey's ship when Mr. Powell came aboard. Horrid visions of another Booker Washington dinner affrighted the gallant officer. If he went ashore, he would surely have to call upon the Minister; later he might even have to invite him to dine! That was enough to blanch the face which the thunder of the Spanish guns left unmoved. Hence the hasty retreat; hence the strange excuse that a few random bullets had stopped the man who had despised the Manila torpedoes, in right Farragut fashion, and had sailed in to singe the beards of the Dons. No wonder that the Southern papers are chuckling over the way in which one civilian negro put the Admiral of the Navy to flight.

The Panama melodrama is over, and the stage properties are being disposed of. The army of the republic has been reduced to one battalion, and the entire navy is offered for sale. Now may the heroic Panamanian seek the shadow of his own vine and fig tree, and take a well-earned rest. He has labored, but President Roosevelt has entered into his labors, and will look after affairs on the Isthmus. The President may urge noble activity, but the inhabitants of the new republic are predisposed to an existence free from all the little annoyances of everyday life. It would be folly, therefore, for them to strut across their mimic stage and play their little part any longer. Besides, $10,000,000 (the gratuity which this country has dropped in the lap of Panama) will, after all, not last forever. Unless "rigid economies" are practised, independence will not turn out the "good thing" the Isthmian patriots had reason to expect. Panama knows on which side her bread is buttered. Why on earth should she spend her windfalls for police purposes? We are prepared to look after her that way, and also to insure her good sanitation. Her legal adoption by Uncle Sam has not yet taken place, but that is a mere formality, and does not prevent her from "laying down" on the old gentleman.

Since the first explosion in the House over the so-called Bristow report of "charges" against Congressmen, it has been made abundantly clear that the document contained much irrelevant matter indiscriminately printed. In certain cases, obvious injustice was done by giving the names of Senators or Representatives in the index as among the culpable. Several of them have been able to show either that their action had been perfectly correct, or else that it would appear so if all the correspondence were given out. Representative Kitchin, for example, has produced further letters relating to the post-office at Oxford, N. C., which puts the matter in a different light from that of the original report. He asserts that a part of the correspondence in this case was deliberately "suppressed"; but that seems unlikely. It was only another instance of the careless and uncritical way in which the clerks of the Department swept the pigeon-holes and threw the resulting mass at the House. Just how much injustice was done by this we shall not know until the McCall committee tells the whole story, but, on its face, the report was glaring evidence of official ineptitude. Issued by the Postmaster-General, the blame for the ill-arranged affair is technically his, and is one proof more of his unfitness for the office he holds.

Senator Hoar never touches any subject that he does not adorn. His lucid interpretation of the Civil Service law on March 23 possesses all the charm of novelty. The purpose of that measure has hitherto been misunderstood. Senator Hoar says that the old theory that to the victor belongs the spoils had much to commend it. But, like all good things, it was subject to abuses. Appointments were sought not alone on the ground of "political faith," but because of allegiance to the "particular political chieftain." This made the Civil Service law necessary. It was not that academic examinations were needed to find out the fitness of applicants for office. Oh, dear, no! What was wanted was some means of insuring "equal distribution in all parts of the country of Government employment." With the insight of genius, Senator Hoar has got at the very heart of our political situation. A euphemism was needed to reveal to us the real nature of our Quays, Platts, etc. That has now been supplied by the senior Senator from Massachusetts. "Political chieftain" is a term that explains itself. It tells us that politics in this country has reached a state of feudalism. Irresponsible barons have arisen on every side, each with his body of retainers (intent on loaves and fishes), and these "political chieftains" have waged war on each other to the subversion of public interests. The strife has been so bitter that a *modus vivendi* is absolutely necessary, and this is supplied by the Civil Service law. Let us be glad, however, that incidentally the public derives a modicum of benefit from the measure.

Senator Burton of Kansas appears to be one of the most innocent gentlemen ever indicted. He explains his course with touching simplicity. Do you ask why he took a retainer of $500 a month from a company doing illegal business? Why, he "needed the money." The phrase is his own, and he used it in court apparently without the flicker of an eyelid. Then with what a grace of naïveté all his own Mr. Burton explained how he was but following high Senatorial example! Many Senators made large sums, he understood, by "practising before the Departments," and Mr. Burton was but imitating them. And he was doing it in a very "humble" way. Where they made their $30,000 or $40,000, he was content—for a beginning—with a mere $2,500. One can see how all this will ingratiate Mr. Burton with the Senate. To say that many Senators are as deserving of indictment as he, is a very miracle of tact for a man under a cloud and in need of the sympathy of his colleagues. The jury having convicted him, all the more will Senators not let him off easily for having been guilty of the blunder—worse than a crime—of hailing them as fellow-grafters.

"Of course," said a Republican Senator the other day, in a burst of candor, "we here in Washington are acting like a set of cowards." He was referring to the official programme for an early adjournment of Congress—possibly by May 1 so as to dodge or strangle measures clamoring for attention. He meant particularly the labor bills urged upon Congress. There was the eight-hour project. There was the anti-injunction bill. Both these measures, the Senator admitted, were big with injury and menace; both ought to be fought openly in Congress; both should be made the occasion of laying down sound economic and political doctrine, and of telling the labor unions wholesome if unpalatable truths. But Congress dared neither pass nor defeat the bills. Consequently, the plan was to kill a little more time by having "hearings" in committee, and then suddenly adjourn and skulk away home. The attitude is certainly not heroic—it looks painfully like sneaking away; yet it has the approval of a militant Administration. But it is not even prudent. Nothing is gained by shirking. These labor whimsies have got to be met sooner or later, and the sooner they are met the less formidable will they prove. Temporizing and evasion are the most foolish as well as the most contemptible of policies when it is a case of public mischief that has, in the end, boldly to be fronted, unless it is to be allowed to work havoc in the commonwealth. Putting off work that has to be done merely doubles it. Questions that you refuse to settle when you can, have an ugly way of settling *you* later on.

Politicians are slow to feel the pull of bravery's gravitation. Yet political annals are starred with the names of those who have taken their courage in both hands and compelled admiration even from their opponents. John Stuart Mill having once said that English workingmen were careless about speaking the truth, in minor matters, was challenged therefor on the hustings. He quietly avowed having expressed the opinion, and added that he still held to it. The resulting cheers came from none more heartily than from the laboring men in his audience. An early instance of Mr. Cleveland's clear courage is worth referring to on account of a certain approval it won him. When Governor, he vetoed the popular five-cent-fare bill. One Theodore Roosevelt was then a member of the Assembly, and he rose to say that the Governor's action in withstanding prejudice and pressure had made him ashamed of himself for voting for the bill. Yet Senators at Washington would make cowardice the chief of political virtues!

A new method of limiting production has been devised by the Plumbers' Union at Alton, Ill. Their rule strikes not at scabs, but at bosses. In order that these shall not work, they are bidden under appropriate penalties to wear white shirts while superintending all jobs. Thus the boss, who should be only the cause of work in others, is readily distinguishable from the journeymen plumber, who may work as much as his union lets him. Furthermore, since a stiff shirt is an uncomfortable garment for exercise, careless or perniciously industrious bosses are to be deterred from manual toil by the thought of immaculate collars and cuffs. If there be anything in the evolution theory, the boss plumbers of Alton should gradually assume, with the boiled shirt, the majesty and the manners of our New York floorwalkers. As for the tendency of such an action, it never does any organization good to make itself ridiculous, and this rule for boss plumbers is about as foolish as, say, a requirement of football uniforms for journeymen.

It will not do to let a good thing be carried too far. This is one of the lessons that the labor unions are now learning. The painters in Pittsburgh, who have more logic than humor, have lately found themselves in a pretty plight. Their district council was holding a meeting for the purpose of discussing some new by-laws. When the one fixing the wages of the council's "business agents" at $3.40 a day was read, one of these functionaries jumped to his feet and shouted: "I refuse to work for less than $4 a day!" To quote one report of the meeting, "the remark came like a night attack on Port Arthur." The council learned that there were more things in heaven and earth than were dreamt of in their philosophy. It was $4 or a strike. One member thought to reduce the obstreperous agent to terms by reminding him that "a business agent is no trade"; but all in vain. The aggrieved party secured the support of two fellow-agents. A sympathetic strike was called, and then the union began to review the facts. These were very embarrassing. It was figured that the agents had no right to strike without the union's consent. But, on the other hand, it was their place to investigate and report on their own action. If they saw fit, they might order a sympathetic strike of the whole union. But against whom? What would happen if the dissatisfied agents should form a union of business agents and raise wages? The unions in that case would be bankrupt. As might be expected, $4 a day was found to be a cheap means of escaping from this metaphysical entanglement? The surprising thing is, however, that before reaching this solution of the problem the union did not consider the expediency of "scab" walking delegates.

Possibly most persons will not be able to view the foreign-trade statement for February quite as favorably as do some of the Washington correspondents. It is not clear that "the permanence of prosperity is indicated by the fact that domestic manufactures exported in February, 1904, were greater in value than in any preceding February, and formed also a larger percentage of the total exports than in any preceding February." Great stress is laid on the fact that $38,000,000 of manufactured goods was exported, against $34,000,000 in 1900, the previous banner February, and that for eight months the same class of exports exceeded 1900 by $20,000,000. But unfortunately the prosperity of the country does not depend entirely on its manufactures. Agriculture is still the main source of its wealth, and the Republican enthusiasts seem to forget all about this side of the situation when they discuss the February trade statement. It passes comprehension how a good Republican Administration can see anything to boast of in a report that shows that in a single month total imports increased over $6,000,000, while exports fell off more than $5,500,000. The fact simply is, for one reason and another (chiefly because of speculation in this country), our exports of agricultural products decreased nearly $13,000,000 in February, though there was a gain of about $5,500,000 in the exports of manufactures. To be sure, the aggregate figures for eight months show an increase in exports and a decrease in imports; but the significance of the trade figures is quite as much in what they reveal regarding the present tendency as concerning the past.

Gov. Warfield's modification of the negro disfranchisement amendment now before the Maryland Legislature is worthy of careful consideration. Waving aside suggested applications of the iniquitous "grandfather clause," he proposes a property qualification of $400 for all voters. This would undoubtedly work extensive disfranchisement of the negroes, but it would be fair to both races. The passage of such an amendment would give Maryland real distinction as a State that had passed special legislation on the negro problem without resort to fraud. Accordingly, we trust that Gov. Warfield's fair and simple proposal will be duly weighed by the Legislature. Its summary rejection, as predicted in the dispatches, would be unworthy of the State that in all its history has conspicuously given examples of political and religious tolerance.

Mayor McClellan continues to speak with no uncertain sound of his determination to put down and keep down open gambling and vice in this city. This is gratifying, and we have no doubt that the Mayor means what he says. But he must be aware, by this time, how great a labor he has on his hands, and how little support he is getting from Tammany. Indeed, it is clear that his course has already produced something like a revolution in Tammany. Murphy is almost broken down in health under the repeated demands for an explanation by angry district leaders. They never expected to be "good" in this way, and the pressure upon them of the gamblers and liquor-sellers whose money they took is getting to be something fearful. None of these things will move the Mayor, as we believe, but they should certainly convey a warning to him. He will have to exercise double care in the choice of his subordinates. Already he has had to get rid of two Tammany police deputies, and the remaining one, McAvoy, cannot follow them too speedily. Between Tammany and decent government a great gulf is fixed. That was asserted before the election, and Mayor McClellan is proving it true after. The Tammany mutterings of insurrection are really a compliment to him; but he should learn from them that vice cannot be held under by vicious men.

After two years of deliberation, the plan for awarding the Rhodes scholarships has been perfected, and the first stated examinations will be held on April 13 and 14 next. Dr. Parkin, representing the trustees, has overcome the difficulty of linking the educational systems of America and the colonies with that of Oxford, by requiring that all candidates shall have passed at least two years in a degree-giving college. These upper classmen will thus be, academically speaking, from a year to two years in advance of the Oxford freshmen. Rhodes scholars, after the difficulty of adjustment is over, should form an intellectual élite. All this is curiously at variance with Mr. Rhodes's will. It was evidently his notion to supply average undergraduates, and not special students. He actually advised that recommendations for athletic, likable, and efficient qualities should count for more than examinations. A pious regard for his wishes leads the trustees to solicit testimonials on prowess and popularity, but it is not to be believed that these will outweigh the examinations, which, by anticipation, are already causing shudders among ingenuous youths, otherwise completely fortified with all manly qualifications. We believe, however, that Dr. Parkin has made a very wise interpretation of his charter. Requiring a certain maturity and preparation in his candidates, he provides against unworthy beneficiaries and insures against the too-ready absorption of the Rhodes scholars in the ruck of Oxford passmen. Mr. Rhodes, had he attempted to execute his own deed of gift, would have been the first to see that grave trustees cannot undertake to find sub-freshmen of conspicuous magnanimity and capacity for leadership. Unluckily, you cannot examine for the qualities that made Mr. Rhodes himself famous.

Premier Combes's bill forbidding all teaching by the religious orders passed the Chamber of Deputies on Monday by the comfortable majority of forty-seven. In debate, the original severity of the act has been somewhat mitigated. Ten years' respite before total suppression—instead of five—is allowed; M. Leygues, Minister of Education, succeeded in saving the schools that prepare for missionary service abroad. But in general the act is likely to achieve its end of forcibly secularizing French education, for the Senate will hardly venture to stand against the anti-clerical passion now so strong in the electorate. M. Combes's bill has been spoken of as the completion of Waldeck-Rousseau's Anti-Associations law of 1901. Nothing could be further from the truth. Waldeck-Rousseau, as he has explained in and out of the Senate, merely desired a discretionary power to use against disloyal or dangerous orders. Combes has practically declared that all the religious orders are disloyal and dangerous, and has secured a wholesale writ of expropriation and proscription. He denies to the Roman Catholic associations what in all free countries is regarded as an inalienable right—that of maintaining schools. A law so subversive of republican principles can be justified only on the theory that the religious orders are actually imperilling the existence of the republic. M. Combes's measure is virtually that of a dictator directed to see that the republic receives no harm.

Very soon M. Combes must defend his Naval Secretary, M. Pelletan, against the gravest charges of inefficiency. It appears that the *enfant terrible* of the Ministry has let the machinery of his department grow rusty. Reduction of the personnel has caused deterioration in the ships and wasting of the stores. Ill-advised changes in cruisers under construction have run up their cost inordinately; appropriations for dockyards lie idle in the treasury for want of engineers to set the work in motion. So long as the bill against the religious orders is preferred business, M. Combes is likely to hold his majority; beyond that all is uncertain; but the disaffection of the Parliamentary Socialists is very likely to centre upon Comrade Pelletan's mismanagement of the navy. Meanwhile, everybody is recalling Léon Bourgeois's epigram on the Naval Minister: "I advised giving Pelletan a portfolio so that the next Government needn't do it; but I never said he should be passed out through the Department of Naval Affairs."

The proposed Japanese war taxes were apparently more than even a patriotic people were prepared for. The Government's programme has in the main received the approval of the leaders of both political parties, but certain features of it have been found grievous. It has been decided that the proposed land tax shall be lowered somewhat, and that the plan to tax salt and silk stuffs shall be dropped. As a result of these modifications, the projected revenue will, it is estimated, be reduced about $5,000,000. The land tax has been bringing in about $24,000,000 annually since 1899, when the rate, owing to the financial necessities of the nation, was increased to 3.3 per cent. on agricultural and village property and to 5 per cent. on city building sites. Salt and silk stuffs have hitherto been exempt from internal-revenue exactions, and the disinclination of the political leaders to make any change is significant. The burdens of the Post-Bellum Programme have told severely on the Japanese people. From 1886 to 1896 the annual tax receipts of the nation increased from about $31,000,000 to about $36,000,000. But since 1896 they have jumped to $79,000,000, an increase of more than 100 per cent. On top of this comes the war revenue measure, which is likely to prove so burdensome that even a $5,000,000 saving is a matter of no light importance. Indeed, the situation is such that it is now proposed to limit the period of the new taxes to one year after the close of the war, although this will not help the sale of the bonds which the Government will sooner or later have to put on the market.

THE DEMOCRATIC OPPORTUNITY.

The course of events is every day emphasizing the great opportunity before the Democratic party. Never was the longing for an eligible Opposition more pronounced or widespread. Thousands of Republicans are coming reluctantly to believe that what their own party most needs is a sound drubbing at the polls, and are asking with unconcealed anxiety whether the Democrats are likely to offer a platform and a candidate such as the country can hear of without alarm. Under our system of party government, the natural remedy for such arrogance, such corruption, such fierce factionalism as the Republicans are now displaying in office, is to turn them out; and it is mainly a question of the Democrats showing themselves fit to be used as the means of punishment.

So much for the general situation, and for things external to the Democratic organization. Within it, moreover, the occasion is most auspicious for ridding the party of two pests at one shot. Rightly considered, the joined forces of Bryan and Hearst are a great stroke of luck for a sane Democracy. It is not often that a party has so good a chance to renounce publicly the devil and all his works. To repudiate either man mentioned would count for much; to show that it is able to ride over them both, in their unholy alliance, would of itself go far to prove that we have again a Democratic party, clothed and in its right mind.

It is a sure affinity which brings Bryan and Hearst together. Both are essentially self-advertisers. To both, notoriety is the breath of their nostrils. Both exploit their Democracy purely for personal aggrandizement. If Bryan is a firebrand, Hearst is a whole conflagration. He preaches the war of classes. He regards the Treasury precisely as he does his own millions—just so much money more with which to buy political support. Having caught the trick of anarchistic utterance from Bryan, he far outbellows his teacher. Yet Mr. Bryan, in his desperate attempts to sustain his failing fortunes, does not hesitate to strike hands with this vulgar compound of ignorance and recklessness, who thinks that money can gild his infamous career. We had hoped that Mr. Bryan, whose private life has been, we believe, beyond reproach, would shrink from the repulsive contact of a man whose life has been passed in unmentionable licentiousness; but seemingly he will stop not even at that to wreak his vengeance, if possible, and prevent his own threatened submergence.

By seizing the opportunity to defeat this noble pair of brothers, the Democrats would do more than they possibly could in any other way to reassure the country. That would be bringing forth fruits meet for repentance. On the other hand, to stoop to Hearst would be to sink the party almost beyond recovery. Senator Clay of Georgia has truly said that the nomination of Hearst would mean not only immediate disaster, but a stain upon the party's good name which it could not live down in twenty years. Some political sins are unpardonable; and one such would be for the Democratic party to take up with a man who, to say nothing of the foul-smelling trail he has left behind him, would make of a Presidential nomination a huge advertisement of himself and of the disgusting wares he has to sell.

The signs are, on the whole, gratifying. It is obvious that Southern Democrats are not going to touch the Bryan-Hearst pitch. Delegates from New York, New Jersey, Pennsylvania, and Massachusetts will surely be against that combination of dirt and desperation, and will be in a position, first of all, to write the Democratic platform. Let that be made sound and clear, and both Bryan and Hearst will be ruled out *ipso facto*. If they bolt, so much the better. That would furnish the last needed guarantee that the Democratic party had left off the feeding of swine and had set out for its father's house. The hour has, in short, struck for a resolute, energetic, and honest Democratic leadership. The saner men in the party are plainly more awake than they were a month ago to both their peril and their way of escape. Hard work is before them, but it is certain that they can, if they will, go to St. Louis in such force that the fusion of the worst elements will be routed.

DEFINING "POLITICS."

President Roosevelt's letter to the Panama Canal Commissioners is, of course, really a letter to the country. Those eminent gentlemen did not need to be informed so solemnly of their own eminence. They knew, before they were told, that they had been chosen to do a great work; that they are not politicians, but engineers; and that the more business-like and honest their methods, the better will be the result. It is, therefore, the public and not the Commission that the President is taking into his confidence. He wants the people to know that he intends to have the Isthmian canal uncrossed by the trail of politics. The Commission is to be non-partisan, having no relations with the spoilsmen and place-hunters; and its work, accordingly, is to be marked by integrity and efficiency throughout.

This is excellent, and Mr. Roosevelt deserves praise for enunciating these principles, and for acting upon them. But what a reflection it all involves upon the manner of conducting the other large business enterprises of the Government! At Panama, the President says, we are to rule out utterly all political considerations. We do not want to see slackness and waste and corruption stain and check that vast undertaking, so we resolutely exclude politics. Admirable; but how about the other departments of governmental business, where we allow politics to hold sway? If political appointments and political control at Panama would mean bungling and pilfering and a squandering of the nation's funds, do they not imply the same thing at Washington? The conclusion seems unavoidable. Mr. Roosevelt's letter, in fact, appears to contain an accurate if unconscious definition of politics. By its absence we learn what its presence signifies. The President tells his friends indignantly that he is incapable of imperilling the great national labor on the Isthmus by turning it over to the politicians. Yet he is all the while turning over to them much greater and more important business of the Government. Thus, on his own showing, the inefficiency and waste which he is guarding against at Panama he is tolerating at home.

Compare, for example, the Panama Canal with the Post-Office. The former is to cost, say, $300,000,000, and will do a business of perhaps $4,000,000 or $5,000,000 a year. But the Post-Office investment of this country must be far larger, and its yearly business is twenty-five times as great. Yet this department of the Government is steeped in politics. Some of the resulting waste and fraud we have lately seen painfully in evidence. Does the President, however, say a word about applying the same business and non-partisan standards there that he insists upon in building the canal? To be thoroughly consistent, he should have written a letter to Postmaster-General Payne, on that gentleman's appointment to office, of a tenor similar to the one he sent to the Canal Commissioners. Paraphrasing the latter, it would have run about as follows:

"DEAR MR. PAYNE:

"I have appointed you to be head of the Post-Office Department, simply because I think you best fitted for that great task. I have not sought to ascertain your politics. If at any time I feel that you are not rendering the best service which it is possible to procure, I shall disregard my feelings for you and get a better man forthwith. I shall expect you to appoint no man for reasons other than your belief in the aid he can render you, and under no circumstances will you pay the slightest heed to any backing or influence he may have. The expenditures you will supervise as rigorously as if they were being made for a private corporation dependent for its profits upon the returns. Representing neither section nor party, you are to secure the best talent this country affords to meet the conditions as they arise."

The very suggestion sounds like a joke—but why should it? Business is business. What would mean extravagance and delay and peculation and scandal on the Isthmus, will surely mean it everywhere else. Mr. Payne was put into the Post-Office Department purely as a politician, and for the very purpose of letting politics bring forth its perfect work. The

appropriations mount; the deficit swells; scandals thicken. Why not? Has not the President just explained how the same calamities would befall the canal if he did not keep it out of the clutches of the political looters? A principle of human nature does not alter with a few degrees of latitude. The way to be economical and honest and efficient at Washington is the same as at Panama. Mr. Roosevelt starts back in horror at the thought of surrendering the Isthmus to the spoilers; but he yields them the continent without a qualm.

We have always felt that there was a singular hesitancy in driving home the non-partisan argument. It is admitted, to a certain extent, for cities. The numbers are increasing of men who will say that the affairs of a municipality should be taken "out of politics." The same principle has been maintained in connection with our colonial dependencies as it is now in the case of the Panama Canal. That is, we say that cities must not be despoiled or colonies ravaged by the politician, but that he is to be allowed to wreak his will upon all our larger administrative business! Some day, the American people will wake up to this nonsensical inconsistency. If politics spells waste and plunder, it should be banished from all public business. President Roosevelt, by his innocent confession that corrupt politicians would ruin the canal if he allowed them to get a hand on it, has officially defined politics as a system of wilful waste and incapacity. How long are we going to endure it at home while washing our hands of it abroad?

TO SAVE THE SHORTHORN KINGS.

Mr. John W. Springer, the cowboys' candidate for vice-president, asked at a recent cattlemen's convention why "the producer of meat, who feeds the world," should be singled out for financial destruction. It was only right and proper, he said, that Wall Street gamblers, "who coddle their peewee brains that they can 'buck the tiger' on the stock market," should lose, but that the capable shorthorn king of the prairies should fall before the Beef Trust was pitiable. Speaking of the experiences of the cattlemen in the past year, Mr. Springer said: "Without apparent reason, prices began to drop, and they have gone from bad to worse." At the Texas State convention of cattle growers, which has just closed its sessions at Fort Worth, the same story was heard, with variations. Men buttonholed one another in the hope of making "deals" in cattle, but there were few who cared to buy at any price. Offers of $17 a head for two-year-old steers were the best to be had, though before the packers perfected their combination the same class of stock sold readily for $22. More enthusiastic detractors of the Trust declared that the decline in prices paid to the grower had been as much as 50 per cent., involving a total loss to the country of considerably more than $500,000,000.

Whenever charges like these are uttered by the stock growers, denials are made by the packers. But it is difficult to convince the man of the prairies and stock farms that it is simply the law of supply and demand which regulates prices of live stock. The experience of a ranchman in Indian Territory who, besides owning some thousands of cattle, runs a general supply store, is, however, full of significance for the plainsman's reasoning. This man submitted figures to prove that the price of cattle had decreased to such an extent that he no longer found it profitable to raise them, and at the same time, as a storekeeper, he knew that the prices charged by the packers for canned meats and refrigerated products are higher than when steers were bringing better rates at the Chicago stockyards. The story of the ranchman who went to Chicago with a trainload of fat steers is familiar through having been told before a Congressional committee. This shipper found at the stockyards only one buyer to bid on his cattle, and the price offered seemed absurdly low. He waited a day, at considerable expense, in the hope of getting another offer, but none came, and he was compelled to accept the original bid. Watching the herd after the sale, the ranch-owner saw it divided and partitioned among a number of Chicago packing houses. The ranchman, therefore, concluded that competition among the great packing houses has ceased—a Trust.

The general public shares the quarrel, too. With the prices of live stock far below the normal level, why does the price of meat to the consumer remain at the high level of three years ago, when cattle brought nearly twice as much in the Chicago markets as they do now? Yet, again, whenever the consumers make this complaint in too loud a voice, the packers retort that the blame is not theirs but the wicked retailers'. The retailers, whether of New York or Chicago, point, in turn, to the prices they are charged by the packers. And when the investigators again crowd the packers, and figures are produced to convict the latter, the fault is skilfully shifted to the farmers. It is asserted—as a member of the firm of Swift & Co. stated in a Chicago newspaper—that the farmers found corn too expensive to feed to cattle, and as a consequence an unusual number were sent to market. That is an old argument—too old to convince the cattle owners.

Driven from one argument to another, as they have been, the final stand of the packers has been made on a refreshingly novel contention. It was a yard expert of Chicago who explained that too much prosperity throughout the country has rendered all but the choicest cuts of beef almost unmarketable. For the benefit of the interviewer, the picture was drawn of the country stepping up to the butchers' block and demanding porterhouse and sirloin steaks in abundance, and scorning the 73 per cent. of the carcass that cannot be converted into such delectable cuts. Were the cattle all ribs and loins, it is explained, the packers could manage to extract some profit from what is now a miserably paid industry. But the round steaks and other less desirable parts must be sold at a loss to the packer, though it is somewhat mystifying to learn that what the packers sell to the retailers at 6½ cents a pound is readily sold to the consumers for 12 cents a pound, and sometimes more. Still, it is in line with the great bulk of argument tending to deny the existence of a Beef Trust.

The Atlanta *Constitution* suggests that the desultory and indecisive efforts so far made by the Attorney-General to curb the packers' combine be exchanged for vigorous investigation. As is pointed out, there is little immediate prospect of successful competition by independent packers, and certainly there can be no stimulus towards improving the conditions of cattle raising so long as cattlemen are persuaded that another law besides that of supply and demand rules the markets. If only to save to the country a cowboy running-mate for the President and to preserve a race of "Shorthorn Kings," something ought to be done.

THE FINISHING TOUCHES.

"Whatever is worth doing is worth doing well," is the motto adopted by the Republican organization in this State. The leaders, having made up their minds that New York will go Democratic in November, are resolved that it shall go so completely that nobody can have the slightest doubt or misgiving over the result. This theory, that Gov. Odell and his advisers have resolved that they may as well be killed for a sheep as a lamb, offers the only reasonable explanation of their present attitude.

To specify—the bill to facilitate prosecution of gamblers is finding scant favor among the friends of the Odell machine. In the Senate, Brackett was the chief opponent, and Elon R. Brown ably seconded him. In the Assembly the bill has been sleeping the sleep of the just in the Committee on Codes, and the prospect is that, still unconscious from knockout drops, it may be delivered over to the tender mercies of the Rules Committee in the last days of the session. Indubitably, Richard Canfield would gladly pay from $25,000 to $50,000 to the Republican State Committee if this bill were killed; for, although the proposed law might not enable Mr. Je-

rome to clap him into Sing Sing, it would put him to much inconvenience and expense. But no amount of money that Canfield can raise could offset the political consequence of smothering Mr. Jerome's darling.

If the bill fail and the Democrats nominate Mr. Jerome for Governor, there will not be enough of the Republican State ticket left after November 8 to hold a wake over. Mr. Jerome could make a campaign that would be, not a whirlwind, but a cyclone. He could pose as the man who was ready to bring even a Vanderbilt on the witness stand in order to convict the richest and most powerful gambler in America. The Vanderbilts could easily make their peace with Gov. Odell's Republican State Committee—they can always exert vast influence near their railway lines. But still the word Vanderbilt is not exactly a trumpet call to the farmers and merchants along the New York Central. On the contrary, the rank and file of both parties would be only too glad to promote a District Attorney who defied the name with which people associate the phrase, "The public be damned."

But, aside from this popular prejudice against a family of capitalists—a prejudice which, however unreasonable, would have great political effect—plain people would feel a highly proper resentment against a party that protected a rich criminal in return for a campaign contribution. If Senator Brackett is so fatuous as to imagine that your average country Methodist, Baptist, or Presbyterian, who is still a Puritan, would cling to the Republicans in the face of such charges, he knows nothing of the force of moral convictions. These church people, who are the backbone of rural Republicanism, would give Jerome as candidate a majority which would recall Cleveland's sweep in 1882. Should the Republican politicians want to widen their experience by being buried under an avalanche, the way to destruction and wisdom lies open before them.

The railroad bills are even more conspicuously cherished by the Republican majority in the Legislature. Already within a week we have had the spectacle of New York delegations going to Albany to save themselves from the rapacity of their own representatives. The bill which virtually nullifies the street-car transfer privilege here at the moment when the fight for it seems almost won in the courts, the so-called relocation bill, which apparently enables the company to move its tracks from one street to another and thus acquire a new franchise, are outrages upon public sentiment in this city. If those measures become law, no amount of campaign literature, no flights of oratory, can ever persuade New York that there has not been a deal between the corporations and the Republican committee, of which Gov. Odell is to be chairman. On no other supposition would the action of the Legislature be intelligible. In an interview a week ago, James S. Lehmaier, an enthusiastic Republican, bluntly declared that nothing could drive more votes away from the Republicans than "a surrender to the unjust demands of the railroad corporations." To-day such a surrender seems not merely possible, but probable.

Men who have profound confidence in the sagacity of Gov. Odell speak comfortably as if their warfare were accomplished: "He's responsible for the result now, and he simply must win or be ruined politically." But the fact is that for Gov. Odell a firm grip on the organization is more important than a victory for either the national or the State ticket. If he can save the Legislature from the wreck, or even one house of it, and can make his control of the machine absolute, he can bide his hour in serenity. Gov. Odell as State Chairman, in a Presidential and State campaign, with vast sums to spend, can make his authority in the party so complete for a long time to come that the result of the next election is a minor matter. The main thing is to tap the barrel; and Gov. Odell and his legislative adherents have their hands on the spigot.

At one time the city of Paris offered a reward for saving a drowning man; and rogues used to agree with the watermen, throw themselves into the Seine, and share the reward. In order to prevent this fraud, the reward was made 12 francs for saving a man and 36 for recovering his body; that is, there was a clear profit of 24 francs in letting him perish. The situation in this State is somewhat the same. Should the Governor, as chairman of the State Committee, be able to demand from the corporations a large and immediate reward for doing their bidding, he may profit more handsomely by recovering the dead body of his party than by rescuing the drowning.

THE ART COMMISSION, 1903.

The Municipal Art Commission has for some years been exercising a jurisdiction no less useful than anomalous. Over the acceptance, location, and relocation of works of art it has had full control since the charter of 1897. This power was extended to such public buildings as the Mayor might designate, and, in the amended charter of 1901, to all municipal buildings costing $1,000,000 or more. That gives the Commission a very substantial veto power. In the year covered in the annual report just issued, the Commission passed upon works of a value of $33,600,000; in about half of the models, designs, etc., submitted to it, it required improvement before final acceptance. In all, it passed upon 117 submissions in 1903, against 64 in 1902 and 23 in the previous four years of its existence. Thus, in the past two years the Commission, which had previously had somewhat nominal functions, has become distinctly a power to be reckoned with.

So far, attempts to override its authority have been unsuccessful. For example, a contractor on the Blackwell's Island bridge attempted to proceed upon plans which, while rejected by the Commission, had been otherwise regularly approved. The matter involved $7,000,000. The court ruled that, as the "Art Commission, . . . vested with the veto power by law, has rejected the original design, that disapproval disposed of it. The bridge could not thereafter be constructed in accordance therewith." If the Commission was fortunate in getting ample confirmation of its powers in this conspicuous case, another test case, that of the Bronx Court House, remains in a less satisfactory condition. It illustrates very well the kind of difficulty this new authority meets.

By authority of the Legislature, the Borough of the Bronx bought a site for the Municipal Court House. A worse location could hardly be imagined. The elevated railroad, high at that point, cuts diagonally across the proposed façade and almost envelops the building. The plans for this expensive structure came from a local contractor and builder, who resigned from the place of Building Superintendent just in time to reappear as the architect of the new Court House. The plans and designs were despicable, whether from the point of view of art or utility, but the Commission preferred to rest its veto chiefly upon the unsuitableness of the site. No important public building, the Commission held, should be erected in such an unfavorable location—especially in the Bronx, where land is yet comparatively cheap. President Haffen made the cause of his devotee, Mr. Garvin (the ex-superintendent and architect to be), his own, and at his instance an opinion was secured from the Corporation Counsel in which the Commission's veto of a site was judged illegal. Accordingly, the attention of the Commission has necessarily turned to the building itself, a model of which has been ordered under the charter provision. Naturally, such solicitude about a mere job—though a $1,000,000 one—has irritated President Haffen and his followers. Never before in the history of the Bronx had anybody interfered with a profitable transfer of real estate, or bothered about the place or looks of a public building. The baffled Haffens and Garvins at once suspected personal animus, and made preposterous charges against prominent members of the Commission. In a recent public hearing Mayor McClellan made short work of this gossip, and practically bade the protagonists of the Bronx produce the model

as required by law or cease from troubling.

Evidently the Art Commission, thanks largely to the Mayor, more than holds its own with Haffen and Garvin and the old-school political builders of the Bronx; but in the matter of its authority to regulate the site of a public building the question remains open. Mr. Rives's adverse opinion was based upon a literal reading of the charter, which gives no such power expressly. If the power exists it must be obtained inferentially, either as a necessary complement to the powers already conferred in the charter, or as a natural extension of the undisputed right to fix the site for all works of art. Clearly, a fine building may be almost as much impaired by bad location as a statue or a fountain. If the Commission, chiefly in the interest of dignified architectural effect, has the right to veto the plans of public buildings, it should have the cognate right of preventing the handsomest designs from being nullified by unsuitable surroundings.

Were such a power granted through judicial finding or the amendment of the charter, it would bring new and heavy responsibilities upon the Commission which it could fulfil only by cooperation with the various administrative committees of the city. Obviously, it is awkward for the Board of Estimate and Apportionment to acquire a site, only to have it condemned and virtually ordered resold. Under ideal conditions all new sites would be first discussed, and an agreement arrived at. In fact, as the annual report attests, such negotiations are already usual:

> "The work of the Commission has brought it into official relation with nearly every department of the greater city and the boroughs of Manhattan, Brooklyn and the Bronx. Most helpful coöperation has been had from all, of which we have availed ourselves to the utmost by liberal construction of the law providing:
>
> " 'In all matters of which the Commission takes cognizance pertaining to work under the special charge of a commissioner or department, the commissioner having such special charge shall act as a member of the Commission.' "

On the whole, then, the Art Commission has fitted into its untried and difficult functions with surprisingly little friction. Mayor Low turned over more than a hundred discretionary cases to it, where Mayor Van Wyck had submitted none. Mayor McClellan has already manifested his friendliness in very serviceable ways, and Commissioner McAdoo welcomes its counsel on police station sites. An even surer sign of the respect the Commission has won is the gradual but marked improvement in all the plans presented. The mere knowledge that drawings, models, etc., are to be rigorously scrutinized by an expert body, stimulates to their best work many who formerly looked upon the city as their softest client.

FROM WATERLOO TO ST. HELENA.—I.

PARIS, March 8, 1904.

There are as many as three members of the French Academy who devote all their time and efforts to an exact reconstitution of the history of the Emperor Napoleon and of his epic period. M. Frédéric Masson gives us volume after volume on this subject; M. Albert Vandal has written in succession the history of the Russian campaign, the history of the Eighteenth Brumaire and of the transition from the Directory to the Consulate. We owe to M. Henry Houssaye a very interesting and dramatic account of the years 1814 and 1815. Lately, M. Houssaye has followed Napoleon from Waterloo to St. Helena, and described what may be called the political agony of the Emperor.

Three days after his abdication, on June 25, 1815, Napoleon, who had resolved to sail from Rochefort for America, left for the Malmaison, where he intended to remain till the day of his departure should be fixed. He had a small following—only Marshal Bertrand, Generals Gourgaud and Montholon, and a few officers. He found at the Malmaison the Princess Hortense, and received there visits from his brothers Joseph, Lucien, and Jerome, the Duke of Bassano, Lavalette, the Duke of Rovigo. In the evening Gen. Beker arrived. His ostensible mission from Fouché, the President of the Provisional Government, was to see that Napoleon's safety should not be endangered; in reality, he was to watch the movements of Napoleon. Beker was a good and honest man. Napoleon, who understood at once the nature of his mission, told him that he might be tranquil; he would not break the engagements he had made. "If the choice of an officer had been left to me," he said to Beker, "I would have named you, for I have for a long time known your loyal character." He had a long conversation with Beker, and finally said to him: "I am impatient to leave France to avoid a catastrophe of which the odium would fall on the nation." He added: "Let them give me the two frigates which I have asked for, and I will start at once for Rochefort. But it is well that I should reach my destination without falling into the hands of my enemies."

The Malmaison was just what it was when Napoleon lived in it under the Consulate. "It had the same distribution of apartments, the same neo-Grec decoration, the same furniture, the same statuary, the same pictures, and, in the park, the same lawn, flowers, exotic trees." One can well imagine the Emperor's feelings when he found himself in the place which he had inhabited in his youth with Josephine. He spoke of her to the Princess Hortense, to Bassano. "Poor Josephine," he once said; "I cannot get accustomed to being here without her. I always seem to see her coming out of an alley plucking one of the flowers she was so fond of. . . . She certainly was more full of grace than any person I have ever seen." And he had divorced her, the only woman he had really loved. Viewing it at the distance of a century, we can well say that the divorce was a great mistake; it was a turning-point in Napoleon's career. He sacrificed too much to enter into the families of the old sovereigns, and to become a guest at the table of Olympus. The principle of adoption was better adapted to his system of government than the hereditary principle. He had long thought of adopting Prince Eugene, and the history of France would have been very different if Napoleon had not sought, as he did, the alliance with Austria. M. Frédéric Masson insists much in his late volume on the change produced in all the Emperor's plans and in his political conceptions by the marriage with Marie Louise and the prospect of leaving the imperial crown to a son allied to the imperial family of Austria.

Napoleon, as I have said, was very anxious to obtain two frigates to accompany him to the United States. Fouché officially asked the Duke of Wellington for a safe-conduct for Napoleon. Did he hope that Wellington would refuse it? So it was thought by many, who suspected that Fouché only wished to inform Wellington of Napoleon's desire to leave France. Marshal Davout considered the presence of Napoleon at the Malmaison a danger; he was afraid that Napoleon would place himself again at the head of the army. The Executive Committee which had taken the Government of France in hand, decided that the two frigates at Rochefort should be armed to transport Napoleon to the United States, that Gen. Beker should escort him, and that the frigates should leave the port only after the arrival of a safe-conduct.

"The safe-conduct!" says M. Houssaye. "If Fouché, with an ingenuity which it is difficult to suppose in him, had asked for it, he was quite sure now that it could not be obtained. Wittingly or unwittingly, Blücher's aides-de-camp misinformed La Fayette and his colleagues regarding the intentions of the Powers on the subject of the future French Government, but they told the truth on the question of the guarantees which they were determined to exact against Napoleon. The allies wanted to end with 'the perturbator of the world.' "

Metternich wrote to Wellington that "the three sovereigns considered it an essential condition of peace that Napoleon should remain in their keeping." Wellington, in accord with Blücher, said that he would not suspend military operations till Bonaparte was a prisoner. Lord Liverpool judged that "the best thing would be to put Napoleon in the hands of the King of France, who would treat him as a prisoner." Blücher wished simply to execute Napoleon before the Prussian army, "to render a service to humanity" (letter to his wife from Compiègne, June 27). Gneisenau wrote from Senlis (June 29): "If Wellington is opposed to the execution of Napoleon, he thinks and acts like a true Englishman. England owes nobody so much gratitude as this man, since, by the events which he has directed, the greatness and the wealth of England have been augmented. It is not so for us Prussians; we have been impoverished by Napoleon."

Fouché, who was always well informed, arranged matters so as to prevent Napoleon from leaving for Rochefort and to keep him at the Malmaison. He was quite ready to deliver him to the Allies if it was necessary in order to obtain an armistice. If he could obtain no passports, the Emperor preferred to remain at the Malmaison. In vain did his friends beg him to depart. On the morning of June 28, he sent M. de Flahaut to the Executive Committee to ask once more for passports. Flahaut saw the members at the Tuileries, but obtained nothing but angry words from Davout. "General," said Davout, "go back to the Emperor; tell

him that his presence is an obstacle to any kind of arrangement. He must go; otherwise, we shall be obliged to arrest him. I will arrest him myself." The Emperor was meanwhile taking measures for his departure. Orders were given to make a deposit of three millions in gold with the house of Laffitte, which was to send it to America, to supply from time to time the needs of Napoleon.

The last visitors were arriving: the Duchess of Vicenza, Madame Duchâtel, Countess Caffarelli, Countess Regnaud de St. Jean l'Angely, Talma the actor, whom Napoleon had always admired and protected, Corvisart the surgeon, who gave him a small bottle full of a red liquid. "See," said Napoleon to his valet, "that this bottle be always in one of my garments, so that I may seize it rapidly."

When he was alone, he read a book of Alexander Humboldt's, the 'Journey to the Equinoctial Regions of the New Continent.' He could not remain idle; he said to Monge:

"Idleness would be for me the most cruel torture. Now that I am without an army and an Empire, I see science alone capable of imposing itself strongly on my mind. But to learn what others have done is not enough for me. I want to make a new career, to leave works, discoveries worthy of me. I want a companion who can make me rapidly cognizant of the present state of science. We will together survey the new continent from Canada to Cape Horn, and in this immense journey we will study all the great phenomena of the world."

Monge offered to be this companion; but he was seventy years old. The Emperor thanked him with much warmth.

The Prussians were approaching; they were already near Gonesse. An officer of the National Guard came from Paris hurriedly, and advised the Emperor to be on his guard. He sent a few dragoons on a reconnoissance along the Seine. New instructions were sent by Fouché; he did not wish Napoleon to fall into the hands of the Prussians, and sent word to him that the two frigates at Rochefort were at his disposal. The Emperor made no further objection, and answered that he would leave the Malmaison. He offered, however, to the Executive Committee to play once more the part, not of an Emperor, but of a general, and to arrest the progress of the enemy with the remains of the Guard, not the army corps, which were still intact. The Emperor put on his uniform of the Guard, his boots, his spurs, his sword. He said to Beker: "I promise, on my honor as a soldier, a citizen, and a Frenchman, to start for America on the very day when I have repulsed the enemy."

Beker went to Paris and carried the Emperor's message to the Executive Committee. Fouché entered in a great rage; Napoleon's offer was refused. Carnot and Caulaincourt were silent. Beker retired, with a letter from Fouché to the Duke of Bassano, giving him notice of the refusal. He found the Emperor at the Malmaison, surrounded with officers and horsemen. "These people," said Napoleon to him (meaning Fouché and the members of the Committee), "do not understand the state of things. They will repent having refused my offer." Then he added immediately: "There is nothing now for me to do but to depart." He went to his room, deposited his sword and his military uniform, and put on civilian clothing. He entered the room where Josephine died, and remained alone in it for several minutes. He bade good-bye to his brother Joseph and to Queen Hortense, and made her a present of a diamond necklace. He took leave of the little garrison which had kept guard round him for a few days, and left in a carriage drawn by four horses, with Gen. Bertrand, Rovigo, and Gen. Beker, till he arrived at Rambouillet, where he wished to stop. Not a word was uttered.

Correspondence.

A REPLY.

To the Editor of The Nation:

Sir: I have, until now, maintained unbroken the following rule: Always profit by public criticism, but never answer it. I break this rule for the first, and I trust for the last, time because of the recent communication, headed "A Protest," from the pen of Professor Jameson. This communication concerned Messrs. George Barrie & Sons of Philadelphia, the publishers of 'The History of North America,' of which I have the honor to be the general editor. Its language was of such a nature as to demand a reply from me, although I am but incidentally mentioned in the article.

In the first place, to make my position clear, I desire to state that I have no connection with the advertising department of Messrs. George Barrie & Sons, and I am in no wise responsible for their circulars and pamphlets used to describe 'The History of North America.' I can therefore speak of the matter to which Mr. Jameson takes exception without that personal interest bred of authorship. In the second place, I am prepared to state, after due examination of the advertising matter issued by my publishers, that, aside from the hyperbole considered good trade form and in accordance with the usages of publishing firms, though personally distasteful to me, I find little to take exception to. That little consists of three instances. The first does not enter into the present discussion; the second and third involve changes that Messrs. Barrie & Sons consented to make as soon as their attention was called to the erroneous impression that the phraseology of their circulars might create. The two instances to which I refer are: the use of the word "by" instead of "to" in one circular, and the insertion of the words "determined on" or the omission of the words "through a committee" in another circular. I will not attempt to discuss the question whether or no these instances afford sufficient ground for the attack made by Mr. Jameson upon Messrs. George Barrie & Sons. I simply point out the fact that these instances resulted from slips made by the advertising department of my publishers, and were promptly corrected as soon as they were brought to the attention of the publishers themselves.

If Mr. Jameson, or any one of like standing, had stated to my publishers that in his opinion certain words or phrases were erroneous, there is no doubt, judging from my experience with the firm mentioned, that the suggestion would have received prompt, courteous, and complying attention. This would have been the case even if the objection had been so made to impressions created rather than to words printed. Even in the present case the Messrs. Barrie are desirous of removing all valid cause for objection, but such has been the character of Dr. Jameson's letter that though they, at my suggestion, modify their statements, they nevertheless insist upon their right to use the following phrases: "The American Historical Association some time ago, through a committee, favorably considered the question of a comprehensive monographic history" and "Based upon a plan suggested to the American Historical Association." Mr. Jameson has in his protest charged the said publishers with deliberate misstatement and wilful attempt to deceive. The best proof of the justice of their position is to maintain it in the face of ill-founded criticism. By so doing they will also demonstrate the erroneousness of Mr. Jameson's attitude. Yet they assure me that they will gladly receive suggestions from interested persons and will carefully consider such communications.

The statements in the advertising matter that have been so vehemently objected to by Mr. Jameson were based, so I am informed by my publishers, upon statements made by me in my General Introduction to 'The History of North America.' In so far as they are so based, they are strictly accurate. It is to be regretted that their strict accuracy is marred by the slips of composition already referred to. The statement made by Messrs. Barrie that the plan of 'The History of North America' is based upon the plan outlined to the American Historical Association is, however, strictly true. The existence of this plan is of record. It had been talked of for some time previous to the Boston meeting of the Association in 1899, but at that meeting definite action was taken, and the matter was referred to a committee "to consider the advisability and feasibility of publishing a monographic history of the United States" (Proceedings, 1899, Vol. I., p. 27). This reference to a committee seems a step nearer to the adoption of a plan for a history "to be issued under the auspices of the American Historical Association" than the action of the Washington meeting spoken of by Mr. Jameson. But a step that led still nearer was taken by this committee, which consisted of Profs. A. B. Hart, Herbert B. Adams, W. A. Dunning, John Bach MacMaster, F. J. Turner, Moses Coit Tyler, and Mr. Charles Francis Adams, for these gentlemen reported favorably upon the project (Proceedings, 1900, Vol. I., p. 18), and resolved to "ask the Council [of the Association] at the Detroit meeting to pass the following proposed vote." This vote embraced, among other provisions, the following conditions—"publications to be made in small volumes," under "an editor-in-chief," and the work to be "a coöperative history of the United States" (Proceedings, 1900, Vol. I., p. 19). Such was the plan proposed to the American Historical Association, such the plan upon which the present history is based, such the claim that is made by Messrs. George Barrie & Sons for their work. Because of these facts, it is evident that the statements made by my publishers are, with the instances rectified, absolutely true.

If Mr. Jameson will read my general introduction to 'The History of North America,' he will find that I plainly set forth the fact of the rejection by the Council of the

American Historical Association of the proposed plan, which he is quite correct in stating was not mine, and which I may add is nowhere claimed to have been mine. He will also find the following statement:

"This determination of the Council, although at the time it was uttered it gave rise to much adverse criticism, was, nevertheless, the correct one. The members of the Council realized fully the need of a general history. They were heartily in favor of it, but they wisely declined to involve the Association in the determination of those to whom the preparation of the work was to be intrusted or to assume the responsibility for the work, thus condemning all other works after its preparation had been completed."

Continuing, I speak of the fact that the action of the Association unfettered individual enterprise, and then I describe the manner in which 'The History of North America' was carried to a successful conclusion ('History of North America'; Lee; Barrie, Philadelphia, 1904. Vol. I., p. x.). It will, therefore, be seen that I in no way connect the present work with the American Historical Association, nor do my publishers intend so to do. They insist, however, and I am glad to coincide with them, that the present work is based upon the plan proposed to 'The American Historical Association.'

Trusting that this letter will close a controversy which I regret, I am, sincerely,

GUY CARLETON LEE.

JOHNS HOPKINS UNIVERSITY, March 24, 1904.

Notes.

Messrs. Harper will shortly publish 'The Gems of the East,' by A. H. Savage Landor; 'Greater America,' by Archibald R. Colquhoun; 'Extracts from Adam's Diary,' by Mark Twain; and 'Memoirs of a Baby,' by Josephine Daskam.

'Physical Training for Women by Japanese Methods,' by H. Irving Hancock, author of 'Japanese Physical Training'; 'Bog-Trotting for Orchids,' by Grace Greylock Niles; 'Norwegian Rambles'; and 'What Handwriting Indicates,' by John Rexford, are in the press of G. P. Putnam's Sons.

'Working with the Hands,' by Booker Washington, is in preparation by Doubleday, Page & Co.

George W. Jacobs & Co. will shortly publish 'Phases, Mazes, and Crazes of Love,' by Minna Thomas Antrim.

In the revival of books to meet the current interest in the Far East two could not be overlooked. Mrs. Hugh Fraser's 'Letters from Japan' (Macmillan) have lost none of their attractive flavor, nor have they become antiquated, in the five years since we first spoke in praise of them. The two volumes of 1899 are now combined in one, with all the profuse and well-chosen illustrations, and with no abatement in elegance of manufacture, the type being large and open. The other work in question is J. Dyer Ball's handy dictionary of 'Things Chinese,' some eleven years old, and now issued in a fourth revised and enlarged edition (Charles Scribner's Sons). For ready reference there is nothing like it (for China), and it is as readable as ordinary dictionaries are not. Besides the alphabetic topical arrangement, there is a pretty full index, too little analytical, however, in parts. A third book, English like the others, and most recent, 'The Mastery of the Pacific,' by Archibald R. Colquhoun (Macmillan), has too obvious a bearing on the present crisis in the western Pacific not to be put forth again. Of this also we have spoken at length and favorably; and it contains, our readers will remember, notable chapters on the "Expansion of the United States" and "The Philippines and the Filipinos," as well as on the Dutch islands, Borneo, and Japan. The illustrations are fine, but the index very inadequate.

Guide-books are equally in season with the foregoing. From Charles Scribner's Sons we have Baedeker's 'Northern Germany' in a fourteenth edition, and 'Central Italy and Rome' in the same stage of revision, which need no comment; and a new edition of 'Philips' Handy Volume Atlas of the World,' edited by E. G. Ravenstein. This tiny volume, with rounded corners, readily slips into the pocket. Each map is attended by a page of geographical data; the maps are as far as practicable uniform in scale, and there is an extensive index. A rigid selection has secured clearness in the lettering. The British possessions have been especially cared for. Four plates are given to the United States.

Misses Charlotte Porter and Helen A. Clarke pursue their laudable handy reproduction of the first folio Shakspere with 'The Merchant of Venice' (T. Y. Crowell & Co.). The apparatus of argument, literary illustrations, selected criticism, and glossary constitute much more than half the volume.

The tenth volume of the 'Cyclopædia of Law and Procedure,' edited by William Mack (American Law Book Co.), is, as the publishers very justly say in issuing it, "remarkable in several particulars." It is not only enormous in bulk (to this we have become more or less accustomed in legal publications), but, aside from a few definitions, it is entirely devoted to a treatment of the law of private corporations by a single hand; it is, in fact, a treatise on that subject by Seymour D. Thompson. Mr. Thompson in the last thirty years has been an indefatigable writer and editor, to say nothing of a term of twelve years on the bench of the St. Louis Court of Appeals, nor of his standing as a practitioner today; as an encyclopædist, this volume gives him a rank entirely by himself. It cites some 25,000 cases, and the author is to treat Foreign Corporations in a later volume of the same series. Judge Thompson's qualifications for his task are unusual, and the present volume, where we have examined it, seems very full and useful.

'Tolstoy the Man,' by Edward A. Steiner (The Outlook Co.), is a very surprising book. The publishers state, in an introductory note, that Dr. Steiner spent several months in Russia for the purpose of obtaining material for it; that he not only interviewed Tolstoy, but talked with the latter's intimate friends and his adherents in Moscow, saw many letters which throw new light on the great writer's doctrines and practices, and used other facts obtainable only from Russian newspapers and books. Dr. Steiner himself, in his preface, after a preliminary wholesale condemnation of the Russian Church, which, very obviously, he has never studied and does not understand, adds that he was favored with the use of an unsurpassed collection of Tolstoyana in Berlin, and had sources of other valuable material in Russia indicated to him. Allusion is also made to his having known Count Tolstoy many years ago, and having visited him thrice since the first meeting. After this strong introduction, the reader naturally expects a remarkable banquet of fresh, first-hand observations, sketches, and deductions. As a matter of fact, Dr. Steiner has simply compiled a portrait of the great writer from the latter's published works. All, or practically all, that is original or could not have been obtained from easily accessible works (which Dr. Steiner has quoted from the German, in default of acquaintance with the Russian language), is contained in the first sixteen pages of the first chapter. For anything apparent to the contrary, his knowledge of Count Tolstoy is confined to a meeting of a few hours, twenty years ago, and of about one day (including one night in the Count's house) during his journey of 1903. If that is not the case, and if he knew more, it is a pity that he suppressed it, since (with the scanty exception of the two visits just mentioned, the account, on page 223, of certain "disciples," and Dr. Steiner's perfunctory moralizing) the book is such as any intelligent reader could have compiled on an island of the South Seas from Tolstoy's own writings and what had previously been published about him. The proofreading of names is careless throughout, and puzzling for any would-be student—Tshertkoff and Therkow, for example, being intended to represent the same person, and the Count's eldest daughter being labelled "Tatyana Sevorna" instead of "Lvovna."

The third edition of W. J. Dibdin's 'Purification of Sewage and Water' (London: The Sanitary Publishing Co.; New York: D. Van Nostrand Co.) is, indeed, "revised and enlarged" almost beyond recognition; and in its present form seems to us the best existing summary of the conditions of the sewage disposal problem. Mr. Dibdin himself, when chemist to the London County Council, was among the first to recognize the importance of the bacteria in these processes, pointing out as early as 1887 that the oxidation of the organic materials by the activity of these organisms was their essential feature. The Lawrence experiments of the Massachusetts State Board of Health showed how an almost perfect purification could be secured by intermittent filtration through a layer of sand. It was the English observers, however, who discovered that beds of broken stone or coke furnished ideal conditions for the contact of air, sewage, and films of bacterial growth. Mr. Dibdin is naturally a firm believer in the strictly aerobic process, the so-called contact and trickling filters, since his own work at Barking and at Sutton was along this line. He treats Cameron's preliminary ripening process in the septic tank with somewhat less respect. In general, however, the book is a well-balanced one. The introductory chapters on the chemistry and bacteriology of sewage, on its sterilization and chemical treatment, are sound and helpful. Practically all the important work done in America as well as in England, is considered; the digests of the reports of the Royal Commission and of the Leeds and Manchester experiments being particularly admirable.

'The Grant and Validity of British Patents for Inventions,' by James Roberts,

M.A., LL.B., etc. (London: John Murray; New York: E. P. Dutton & Co.), is designed as a guide for those who desire to take out British patents, and is written from the standpoint of the inventor rather than the lawyer. The first part consists of a clear and sufficiently concise statement of the principles governing the grant and validity of British patents, with special reference to the proper drawing and amendment of specifications and claims. This part contains copious references to the decisions of the courts. The second part consists of abstracts of the leading patent cases, very fully illustrated by drawings which are unquestionably useful for reference. The third part contains the clauses of the numerous statutes now in force relating to the grant of British patents. There is a full index to the decisions cited. The book, which is both large and handsomely made, will be useful to persons desiring to obtain patents in England, although the scope of the somewhat revolutionary act of 1902 remains to be determined by the courts. To lawyers practising in the United States, such a book cannot be of great importance, since the statutes which govern the grant of letters-patent in England and the United States respectively are radically unlike, and the decisions of the courts on the scope and validity of patents consequently repose on widely different principles.

The new wave of romanticism now passing over the whole of Europe has brought with it a renewed interest in what is perhaps the most typical figure of German romanticism of the beginning of the nineteenth century, the poet Novalis. Since Rudolph Haym and Wilhelm Dilthey, some thirty years ago, first laid the foundation for a just appreciation of this wonderful and enigmatic genius, a number of new editions of his works and a large array of critical studies of particular phases of his poetry have borne testimony to his reawakened popularity. The crowning evidence, however, of his ascendency upon contemporary thought is to be found in the work of a Frenchman of German extraction which has just appeared, M. E. Spenlé's 'Novalis: Essai sur l'Idéalisme Romantique en Allemagne' (Paris: Hachette & Cie). This is, beyond all doubt, the most exhaustive, the most profound, and the most artistic view yet given of Novalis's life, personality, and poetic significance. It is a model of impartial and at the same time sympathetic criticism, full of happy characterizations, wide in scope and condensed in expression; in short, a piece of literary research which itself is literature. The most valuable contribution to our knowledge of facts contained in this essay consists in the analysis of the relation between early German romanticism and the religious mysticism and scientific occultism of the end of the eighteenth century. Prof. Henri Lichtenberger, to whom the work is dedicated, may well be proud of such pupils as M. Spenlé and Fernand Baldensperger, whose remarkable study on Gottfried Keller was mentioned in these columns some weeks ago.

The economic development of China, and especially the rich province of Sechuan, is the main topic of the unusually interesting paper by Col. C. C. Manifold in the *Geographical Journal* for March. Here is a region nearly 70,000 square miles in extent, and "supporting the densest population to the square mile that is to be found in any agricultural area in the world; its soil allowing in many places of three crops in the year being taken off the same land. . . . A country with immense industries, holding great deposits of coal, salt, petroleum; and in the older formation of mountains fringing it are to be found copper, lead, quicksilver, and gold." Add a network of navigable rivers. There is already an enormous local trade, which could be indefinitely increased by direct communication with an ocean port. A feasible route for a railway from Burma through Yunnan has been discovered which, with the proposed extension of the French railway from Tonkin and the improvement of the navigation of the Yangtse, will probably secure this in the not distant future. Col. Manifold, who travelled some 9,000 miles in China, remarks on the decay of the Buddhist temples and monasteries nearly all over the land. "Except in Mongolia and Far Western China, little is done for the Buddhist religion now." The personal influence of the officials over the people was shown by the fact that, in an inland city which he visited, the French Lazarist Fathers were unmolested during the Boxer troubles, because the district ruler, "though he had only a few ragged, ill-armed constables to enforce his authority," discouraged any attack on the foreigners or their property. At one point he came upon men who were constructing a new road for the return journey of the Emperor and his court from Hsian-fu to Pekin, in obedience to traditional custom. It was a "very amusing thing to note that all the old obsolete watch-towers, of which there are often five or six to the mile, and which probably for many past reigns had been broken down and out of repair, were carefully covered over with matting, so that their ruined state, though it was known to the Court, should not force itself obtrusively on their notice, for by ancient edicts these towers must be kept in a proper state of repair and defence."

Nigeria was the subject of a paper read at a recent meeting of the Society of Arts in London by the wife of the high commissioner, Lady Lugard, better known as Flora Shaw, formerly head of the colonial department of the London *Times*. After calling attention to the importance of the wise and active development of the tropical dependencies, she gave a sketch of the way in which 500,000 square miles of territory and 20,000,000 people were brought under British control in four years. The means employed were an inconsiderable native force officered by a few whites. The people, however, welcomed them as deliverers from the barbaric despotism of the successors of the Moslem shepherds who conquered them a hundred years before. The tribute, for instance, which they demanded from their subjects was slaves, so that "slaves formed the currency of the empire, and large sums were reckoned not in coin, but in human beings." The result had been the gradual depopulation of the land, and the decay of agriculture and the arts for which the Hausas have been famous since the days when the Saxons still ruled in Britain. No attempt has been made to establish a European form of government, but the Indian system has been adopted of "ruling through native princes, by the intermediary of a British resident, who, with a small staff of white men, was established at the headquarters of each emir, and who acted as the guardian of the treaty rights conceded in each case by the emir. In less than four years every province in the protectorate had been brought within this scheme." To these officials Lady Lugard paid a high tribute as some of the very best types of Englishmen, whose "fairness and kindness in dealing with native questions and with the individual natives themselves had, perhaps, had more to do with the rapidity and completeness with which our administration had been established in Nigeria than any other single quality."

In a paper read before the Bergen County (N. J.) Historical Society in January, Mr. William A. Linn took for his subject "Baron Steuben's Estate at New Bridge" in that county. The estate in question, on which the dwelling house is still standing, had belonged to a Tory, John Zabriskie, and been confiscated, and was given to Steuben by the State of New Jersey in gratitude for his services in the war of independence, for his use and occupancy during life, but eventually, after a nominal sale at auction, in fee simple. Steuben, however, preferred to live and die on the land grant of the State of New York, and sold the New Bridge estate back to Zabriskie. Mr. Linn, who uses Kapp's biography of Steuben freely for a good summary of his career in two hemispheres, corrects it in the particular that Steuben is said to have refused the New Jersey gift on learning of Zabriskie's being impoverished by the confiscation, and to have interposed on his behalf; the facts being as just set forth.

We are requested to state that the following persons have been elected as the Organization Committee of the American Bibliographical Society: Chairman, Worthington C. Ford, Library of Congress, Washington, D. C.; secretary-treasurer, George W. Cole, Graham Court, No. 1925 Seventh Avenue, New York city; Wilberforce Eames, Lenox Library, New York city; A. G. S. Josephson, John Crerar Library, Chicago, Ill.; and Azariah S. Root, Oberlin College Library, Oberlin, O.

The discovery of radium by Madame Curie, with the assistance of her husband (though Rutherford, who is the first authority on the subject in this country, speaks of her simply as "the discoverer") has had the effect to revolutionize our fundamental scientific ideas to an extraordinary degree. But it has another significance. It is not simply that a member of the sex which has been so rigorously excluded, as a whole, from laboratories, should have had the good luck to make one of the greatest of discoveries, but there is the happy conjunction in this case of a husband who insists that she shall have the credit that is her due. It is reported that one of the coveted distinctions with which France rewards her great men has been declined by M. Curie because it was not offered to Madame Curie as well.

—The April *Century* recognizes the uppermost topic in current interest by printing an article on the great Siberian railway, from the pen of the United States Consul at Antung, James W. Davidson, F.R.G.S. Aside from war interruptions, one may enter a car at Paris and proceed by rail to Pekin in sixteen and a half days—a feat the possibility of which was ridiculed as unworthy

of serious consideration by a Paris journal less than two decades ago. The distance from Paris to Port Arthur by train is given as 7,299 miles, about eleven-twelfths of it through Russian territory. The plan has been to establish virtually a through service between these points during the coming summer. Accustomed as we have been during recent years to look only upon the darker side of things Russian, it will surprise most readers to learn from Mr. Davidson of the great care with which the Russian Government provides for the welfare of its employees along this railway, even though they be mere Chinamen. With such facts as are here given, one must admit that the hold of Russia upon the Mantchurian territory is not one of mere brute force, but has in it an important element of substantial favors rendered. The luxurious provisions to be made for travellers on the forthcoming "train de luxe," which is to pass over the line weekly, are too numerous to be detailed here, even in outline. Suffice it to say that they surpass anything to be found in existing train service in Europe or America. A paper on "Landmarks of Poe in Richmond," by Charles Marshall Graves, has some very interesting drawings, including St. John's Church (where Poe's mother is buried and where Patrick Henry delivered his famous words, "Give me liberty or give me death"), the Allan house, the Swan tavern, and Duncan Lodge, the home of the MacKenzies.

—The March *Fortnightly Review* contains the discourse on the "Growing Distaste for the Higher Kinds of Poetry" recently delivered by the Laureate before the Royal Institution. By the higher kinds of poetry Mr. Austin means the epic and the dramatic. In stating that most readers turn with invincible repugnance from narrative and dramatic poems of any considerable length, Mr. Austin falls into an error of diagnosis. The difficulty lies not so much in positive dislike as in the fact that even the educated among us, whether of choice or necessity, are caught in the mad whirl of affairs which gives no time for extended reading in the lines of literature in question. A census of those who have never read the 'Canterbury Tales,' 'Paradise Lost,' or the 'Faerie Queene,' would possibly be far less instructive as to the real attitude of educated men towards poetry than a count of those who have gone through life with an earnest desire to read these works, have drawn them from libraries, borrowed them from friends, bought them, laid out detailed plans for their perusal, but have continually allowed themselves to be foiled out of a real pleasure by the cares of this world and the deceitfulness of riches. As to Shakspere, we feel satisfied that the Laureate falls into serious error of fact as well as of explanation. The countless editions of his works which are continually in process of distribution surely indicate a vast number of deeply interested readers, and readers to whom his real element of superiority—imaginative thought and imaginative action—is not especially repugnant, as Mr. Austin would have us believe. The relative infrequency of quotation from the great masters of verse, as compared with times gone by, is not to be attributed simply to ignorance of their works. We are governed largely by fashion in such matters, and it is not the style in the present age to wear one's literary heart upon his sleeve, as of old. Let us not be too ready to assume that all have bowed the knee to Baal. It has recently transpired that a busy scientist, in the rushing Harvard life of the present decade, could give deep thought to the age of good Queen Bess, and express his thought in no bad verse, as verse now goes; perhaps more than we know are giving hidden hours to the great poets of the past.

—'Memorials of Mary Wilder White' (Boston: The Everett Press Co.), compiled by a daughter, Elizabeth Amelia Dwight, and edited by a grand-daughter, Mary Wilder Tileston, makes its principal appeal to relatives and descendants for whom it was originally prepared; but the sub-title of the book, "A Century Ago in New England," hints at a wider circle for which it will have some interest as an evocation of certain aspects of New England mind and character in the closing years of the eighteenth century and the first decade of the next. Two charming silhouettes of Mrs. White confront us with sincere presentments of her dainty loveliness, but suggest a more vivacious disposition than her letters and her diaries disclose. Born in 1780, in 1801 she married a young West Indian planter and went with him to Guadeloupe, arriving at a time of local insurrection. For two years her life was crowded with vicissitudes, her husband and her brother dying, while her own health and safety were precarious. But the interest of her memoirs depends far less upon these stirring times and tragic stuations than upon the subsequent affairs of her quiet widowhood in Concord, Mass., and her life in Newburyport, where she lived after her marriage with Daniel Appleton White in 1807 until her death in 1811. The husband, a classmate of Dr. Channing, became, as Judge White, one of the local celebrities of Essex County. In the recent biography of Horace Binney he showed to better advantage in his mature correspondence than in the "tame extravagance" of his love-letters, herewith produced. But extravagance was in those times the general note, and the letters of the young girl and widow printed here are so stilted in their Johnsonese as to afford us that amusement which their defect of humor inexorably denies. There are interesting glimpses of Buckminster and Channing, and of various Concord people; most notably of Emerson's eccentric aunt, Mary Moody Emerson, with whom the subject of these memorials was intimate, collaborating with her in letters published in the *Monthly Anthology*, and writing her many privately that curiously reflect the tastes, the manners, and the reading of the time.

—'Ethics of Democracy,' by Louis F. Post (New York: Moody Publishing Co.), is, according to the author, a "Series of Optimistic Essays on the Natural Laws of Human Society." From the wording of the dedication to the memory of Henry George, we are led to infer that it is from the Ethics of Democracy that the Natural Laws of Human Society are to be evolved. But what are the Ethics of Democracy? The book is divided into seven parts, which deal with such subjects as "Individual Life," "Business Life," "Economic Tendencies," "Politico-economic Principles," "Democratic Government," and "Patriotism." In the course of it there is a good deal of writing which may almost be called eloquent, and a good deal that is nearly incoherent. The drift of the whole is Socialistic, but there is in it political economy of the most systematic kind, and political writing of a sound sort. The difficulty is that the author seems unable to distinguish what is sound from what is unsound, and the result is that we have a jumble rather than a book. The essay on Imperialism, for instance, contains a very clear statement of the anti-fatalist view of history; that on Trial by Jury supports the absurd idea that a verdict, however ridiculous, is sacrosanct, and that a judge who expresses his opinion of it commits a crime "worse than contempt of court," because it is a crime "against democratic government." In the same way, Mr. Post has some good general statements supporting the view that political economy is a science of *tendencies;* but in a chapter on "Our Foreign Trade" he solemnly assures us that "our swelling export balance" is largely composed of "tribute" in the shape of rents paid to alien owners of American lands for which "nothing comes back"—a view of our situation which would seem, if believed, to show that there is no hope for us. Indeed, Mr. Post compares our case with that of Ireland. As to public debts, he declares Repudiation to be a "sacred right," qualified, however, by the fact that it must neither be "dishonestly exercised" nor "dishonestly neglected." On the whole, it may safely be said that Mr. Post is not a guide to be implicitly followed, and that those who accept him as a teacher will find it exceedingly difficult to calculate to what conclusions he may not lead them.

—Mr. George E. Littlefield's account of 'The Early Schools and School-Books of New England' is mainly a description of the various text-books in copies of which he has found evidence that they had been used by children who in later years did their part towards developing in eastern Massachusetts what Dr. Crothers calls its "deeply rooted prejudice in favor of intelligence." For nearly forty years Mr. Littlefield's book-shop on Cornhill has been the haunt of Bostonians who care for the history of their town, and into it have come the attic clearings of a thousand-odd New England housewives anxious to get rid of the accumulations of their predecessors. While searching through these for the treasure which every bibliophile is always hoping to find in some pile of old books, Mr. Littlefield long ago realized that the schoolbooks which his fellow bookmen regarded as the veriest junk had an importance all their own, and by no means insignificant. They were the conclusive evidence of how New England got its education. Possessing the inherent Bostonian sense for the historical aspect of things, he began to collect these tattered and torn remains of schoolboy struggles, to look into them for the dates which show when the owners of the scrawling signatures were using the books, and to search for other evidence which would prove when the popular textbooks were first brought over from England, how long and how extensively they were used, and what influence they had upon the curriculum and the pupils. These gatherings give a very unusual value to the volume in which they are brought together. It is a contribution of considerable

importance to the historian of American education, and it would be most unfortunate if its aristocratic seclusion in the rare company of the "Club of Odd Volumes" publications should result in its being overlooked by those who are making that subject their especial study.

—The Japanese Government, through the Imperial Cabinet's Bureau of General Statistics, has sent forth its annual publication on the 'Movement of Population in the Empire of Japan' during the year 1900. The work is an elaborate quarto of 354 pages. The preface, title-page, heads of columns, and tables are in French. The addition of Romanized letters, with the Chinese script and Arabic numerals, make this work of easy consultation, as well as of high interest to the student of vital statistics. Under thirty-four categories, with the most careful classification of sex, age, and place, is given information concerning birth, death, marriage, divorce, diseases and registry. Expert medical knowledge and statistical skill have been employed upon the work throughout, which, however, does not present the total of the population of the Empire (now about fifty millions), for this is not the publication of a census, which hereafter is to be decennial in point of time and very elaborate as to methods of inquiry and publication. Incidentally this work disposes of some curious notions recently set forth, not only by newspaper writers, but even by medical and literary men of repute who, having been in Japan more or less remotely in the past, have not kept up with the movement of population and events. For example, it has been recently stated that *kakke* (beri-beri), which was formerly confined to the low-lying districts at the mouths of rivers, has been, because of improved means of communication by railways and steamers, converted into a national scourge, and will more than decimate the Japanese armies abroad during the coming springtime. As matter of fact, *kakke* has been so far eliminated from the Japanese navy that, as a rule, it is only the old and experienced surgeons who have treated a case on shipboard. The very minute tables of diseases, covering 95 pages, shows that in the whole Empire, excluding Formosa, there were in 1900 but 6,500 deaths from this disease, a figure which, it is safe to say, is scarcely one-tenth of what the facts would have shown fifty, possibly even twenty, years ago. Another ridiculous statement, made by a supposed high authority in London, a gentleman who had flitted through Japan, is that the Mikado's army was virtually controlled by the two clans of Satsuma and Choshiu, and that quarrels between the various clansmen were very common. This not only is untrue, in a nation that threw the whole clan system overboard thirty-four years ago, but is disproved by the facts of to-day. These tables follow the same plan that is used in enlistments and in furnishing commissions to officers, in that the procedure is for the most part not according to the legal or ancestral domicile, but according to the real place of business or residence. In a word, clans and clan "influence" exist only in memory. The subject-matter of longevity, as revealed by the tables, presents interesting phases, but space does not allow further notice of this highly creditable publication.

LORD ACTON'S LETTERS.

Letters of Lord Acton to Mary Gladstone. Edited, with an introductory memoir, by Herbert Paul. With two plates. London: George Allen; New York: The Macmillan Co. 1904. Pp. 353. Cloth, 8vo.

An interesting Introduction to these Letters makes us better acquainted with a remarkable character which has hitherto been somewhat misunderstood. Lord Acton has been commonly regarded as a prodigious reader, a vast collector of books, an unrivalled storehouse of learning, prevented by some peculiarity in his character and perhaps by his very overfulness of knowledge from giving his erudition to the world in a book. Lord Acton's passion for reading and accumulation of learning, especially historical and religious, could not be overstated. It was calculated by a friend that he devoured on an average an octavo volume a day. It was true, also, that he disappointed the world by not writing a great book. Books, however, are not the only vehicles of knowledge and thought. Lord Acton contributed largely to periodical literature, lectured with great effect as Professor of History at Cambridge, and thus exerted no small influence on the literary and intellectual life of his time. Nor was he by any means a recluse. He took an active interest in public affairs, was for six years a member, though rather a silent member, of the House of Commons, and so versed in foreign politics that at one time there was an idea of sending him as Ambassador to Berlin. He was very social, a good talker as well as a lively correspondent, and a first-rate judge of cookery and wine.

The present volume contains only Lord Acton's letters to Miss Mary Gladstone, now Mrs. Drew. But he opens himself freely on leading questions, both of Church and State, as well as on his special literary subject, the treatment of history. He writes, as he says himself, "in serene confidence to the most chosen of correspondents." His idea of history, to speak first of his special line, appears to have been that it should be philosophic, dealing essentially, not with personal character and action, but with the ideas and spirit of the age; or with personal character and action only as revelations of ideas and spirit. The ruling influence he takes to have been always fundamentally religious. To get a great corpus of history written on this principle in its application to successive periods appears to have been his aim in organizing the composition of the "Cambridge Modern History," an enterprise the result of which is doubtful, not only because the narrative is unavoidably dry, but because it seems hardly possible to get a set of minds sufficiently in philosophic unison to carry on the vast narrative in the same spirit and from the same point of view.

The practical answer to this vexed question as to the proper mode of treating history seems to be that there are different modes of treating it, each good in its way as being adapted to a particular class of readers. The philosophic mode alone commends itself to a grand expert like Lord Acton. But, to be read by people in general, the narrative must be lively, and it can hardly be lively without being personal. The one historian of whom, in these Letters, Lord Acton speaks with unqualified admiration is Stubbs. Stubbs is worthy of unqualified admiration in his way as a master of profound and accurate erudition; but ordinary readers would find it a weary task to plod through those three incomparable volumes. Nor is it likely that, when they had accomplished the task, a vivid impression would be left upon their minds. Lord Acton vilipends Carlyle as an historian, and in a less unqualified way Macaulay. Those writers have their defects, undoubtedly, though Carlyle can hardly be taxed with failing to portray the spirit of the age with which he deals. But the ordinary reader surely has learned from both of them a great deal of history—history in the main true—which he never would have learned from a narrative of the English or the French Revolution on anything like the method of Stubbs.

In politics Lord Acton was a Liberal, inclining, apparently, sometimes rather to the aristocratic, sometimes to the democratic, side of the party. He is always for liberty, of which he projected a History—an arduous undertaking, and, if completed, a bulky affair it would have been. He is for a House of Lords, on the ground that the elective house is always varying with the changing moods of the people, and that something is required to temper the violence of the variations. But the question is whether the action of the House of Lords is really regulative. Lord Acton says it represents the land. He should rather have said that it represents the landowner.

If Acton is chary of admitting the personal element in history, he is not chary of admitting it in politics. His admiration, or rather adoration, of Mr. Gladstone is unbounded. He says that when our descendants shall stand before the slab that is not yet laid on the monuments of famous Englishmen, they will say that Chatham knew how to inspire a nation with energy, but was poorly furnished with knowledge and ideas; that the capacity of Fox was never proved in office, though he was the first of debaters; that Pitt, the strongest of ministers, was among the weakest of legislators; that no foreign secretary has equalled Canning, but that he showed no other administrative ability; that Peel, who excelled as an administrator, a debater, and a tactician, fell everywhere short of genius; and that the highest merits of the five, without their drawbacks, were combined in Gladstone. Gladstone was a great and memorable statesman. The meed of honor justly due to him is ample enough. The only proceeding of his hero in which Lord Acton can find any fault is his obituary eulogy of Disraeli, which, no doubt, involved some inconsistency, and had better have been pronounced by the Speaker or by the leader of Disraeli's party; but the leader of the House could not help himself; he had to play his official part. Of Disraeli's distinction there could be no doubt. These Letters unluckily do not extend over that period of Mr. Gladstone's life when he had coalesced with Parnell and was struggling to carry Home Rule.

Saving his personal devotion to Gladstone, Lord Acton's view of politics is independent, and some original and weighty remarks will be found scattered over these Letters. Of the United States he says,

defending extended suffrage against his opponents:

"They will admit much of my theory, but then they will say, like practical men, that the ignorant classes cannot understand affairs of state, and are sure to go wrong. But the odd thing is that the most prosperous nations in the world are both governed by the masses—France and America. So there must be a flaw in the argument somewhere."

His opponents might demur to the case of France, and with regard to America they might point to sources of prosperity far other than political. Having made a special study of the American Constitution "in the amplitude of its safeguards and in its fatal want of elasticity," he observes that a "monarchy cannot be too Constitutional, but a Constitutional republic is a difficult thing to work." In one of his lectures he expressed a hope that the United States would not undertake the government of Mexico, observing that "a confederacy loses its true character when it rules over dependencies, and a democracy lives a threatened life that admits millions of a strange and inferior race which it can neither assimilate nor absorb." Attention had not then been so much called to the danger of admission by another gate, that of foreign conquest, of millions of strange and inferior races, the assimilation of which would be more difficult still.

But the most striking, we might almost say astounding, thing in the Letters is the writer's handling of the Papacy. It was well known that Lord Acton was a Catholic of the Liberal school, one of the circle which, with Lacordaire and Montalembert, had undertaken the arduous work of reconciling submission to absolute authority over the soul with practical liberty of thought and action. He had stood forth as the ardent ally of Strossmayer and Döllinger against the Jesuit and the Jesuit-ridden supporters of Infallibility in the Vatican Council. But he was not, like Döllinger, cut off from the Church. He was never, so far as is known, threatened with excommunication. Nor was it generally doubted that he had lived and died in practice and doctrine a devout Catholic, and a faithful liegeman of the Papacy, though one of the moderate school. There was nothing to contradict this in his alliance with Mr. Gladstone, who was essentially a Catholic, hoping to restore, on the basis of moderate Catholicism, liberated from ultramontanism, the unity of Christendom. Such passages, therefore, as the following, which, to avoid any danger of misrepresentation, we give entire, astonish us, and cannot fail to astonish and even to horrify not only the ultramontane, but any believer in the Papacy as the headship of the spiritual world.

In a letter to Mr. Gladstone quoted in the Introduction, Lord Acton says:

"I have tried in vain to reconcile myself to your opinion that Ultramontanism really exists as a definite and genuine system of religious faith, providing its own solutions of ethical and metaphysical problems, and satisfying the conscience and the intellect of conscientious and intelligent men. It has never been my fortune to meet with an esoteric Ultramontane; I mean, putting aside the ignorant mass and those who are incapable of reasoning, that I do not know of a religious and educated Catholic who really believes that the See of Rome is a safe guide to salvation. . . . In short, I do not believe there are Catholics who, sincerely and intelligently, believe that Rome is right and that Döllinger is wrong. And, therefore, I think you are too hard on Ultramontanes, or too gentle with Ultramontanism. You say, for instance, that it promotes untruthfulness. I don't think that is fair. It not only promotes, it inculcates, distinct mendacity and deceitfulness. In certain cases, it is made a duty to lie. But those who teach this doctrine do not become habitual liars in other things" (pp. 63, 64).

"For there are many opinions, not only sanctioned but enforced by the authorities of the Church of Rome, which none can adhere to without peril to the soul. The moral risk on one side is greater than the dogmatic risk on the other. He can escape heresy in Anglicanism more easily than he can escape the ungodly ethics of the Papacy, the Inquisition, the Casuists, in the Roman Communion. The solicitation, the compulsion, will be made irresistible in the latter. A man who thought it wrong to murder a Protestant King would be left for hell by half the Conferences on the Continent. Montagu, Bramhall will not sap this man's Catholic faith so surely as the Spanish and Italian moralists will corrupt his soul" (pp. 233, 234).

"The Inquisition is peculiarly the weapon and peculiarly the work of the Popes. It stands out from all those things in which they coöperated, followed, or assented, as the distinctive feature of papal Rome. It was set up, renewed, and perfected by a long series of acts emanating from the supreme authority of the Church. No other institution, no doctrine, no ceremony, is so distinctly the individual creation of the Papacy, except the dispensing power. It is the principal thing with which the Papacy is identified, and by which it must be judged.

"The principle of the Inquisition is the Pope's sovereign power over life and death. Whosoever disobeys him should be tried and tortured and burnt. If that cannot be done, formalities may be dispensed with, and the culprit can be killed like an outlaw.

"That is to say, the principle of the Inquisition is murderous, and a man's opinion of the Papacy is regulated and determined by his opinion about religious assassination.

"If he honestly looks on it as an abomination, he can only accept the Primacy with a drawback, with precaution, suspicion, and aversion for its acts.

"If he accepts the Primacy with confidence, admiration, unconditional obedience, he must have made terms with murder.

"Therefore, the most awful imputation in the catalogue of crimes rests, according to the measure of their knowledge and their zeal, upon those whom we call Ultramontanes. The controversy, primarily, is not about problems of theology: it is about the spiritual state of a man's soul who is the defender, the promoter, the accomplice of murder. Every limitation of papal credit and authority which effectually dissociates it from that reproach, which breaks off its solidarity with assassins, and washes away the guilt of blood, will solve most other problems. At least, it is enough for my present purpose to say that blot is so large and foul that it precedes and eclipses the rest, and claims the first attention" (pp. 298-300).

If there were such a thing in the papal code as posthumous excommunication, the soul of Lord Acton would be in some peril. It certainly will lose the benefit of any masses that may have been purchased for it, and the payment for which may be still standing to its credit. Moreover, the present work will not miss the distinction, very gratifying to its publishers, of prompt insertion in the Index.

ACTUAL GOVERNMENT IN THE UNITED STATES.

Actual Government as Applied under American Conditions. By Albert Bushnell Hart. (American Citizen Series.) Longmans, Green & Co. 1903.

As appears from Mr. Hart's preface, and indeed throughout the volume, this is a descriptive work. It is designed for teachers and students as well as ordinary readers. He calls it "an attempt to describe the government as one might undertake to describe a great railroad." But as a great government is not only a working machine, but an historical growth, description involves some history, and this Mr. Hart gives *pari passu* with his description. The history and law, however, are kept in the background, the main object being description. This covers an encyclopædic field, *e. g.*, the individual and his personal rights, including citizenship; the whole frame of government, including the State and Federal Constitutional systems; suffrage; elections; party and machine organization; State and Union in their relation with one another; the State legislatures, executives, and courts; local government and its problems; Congress; the Presidency; the civil service; the Federal judiciary; land and land-holding; boundaries and annexations; Territories and colonies; taxation and finance; foreign intercourse; foreign commerce; war powers; the organization of commerce and transportation; education; religion; public morals, and public order. In view of the use contemplated above, there is also a short list of "a few of the most helpful books on American government," and a "select bibliography" on American government of some twenty pages. To our mind this bibliography is of little value as a guide. Essential books, such as the 'Federalist,' the Debates in the Convention, and Cushing's well-known Manual of the law and practice of legislative assemblies, are omitted, while, on the other hand, some 850 volumes of periodicals are referred to, including the entire series of 'Appletons' Cyclopædia,' the *Atlantic Monthly* and the *North American Review*. There is little trace of selection in the list.

Mr. Hart's essay in political description, of a kind not before attempted, is important, but it is written *currente calamo*, and the author appears to be indifferent on the score of accuracy. So long as he gives a general impression of the subject in hand, he cares little about the correctness of details. This is especially noticeable when he deals with legal subjects, and frequently results in great confusion; and as almost all government is in large part law, is a very serious defect in a manual for students and teachers. For instance, in his account of the English Habeas-Corpus Act, which contains the principle of habeas corpus imbedded in our system (p. 26), he describes it as providing that *any person who thinks that another is unjustly imprisoned* may sue out the writ. Fortunately for prisoners, the remedy is not so narrow. The writ must issue even if the person committed applies for it. In discussing the tariff (p. 401), he says that for many years passengers were allowed to bring in wearing apparel "suitable for the voyage." The quotation marks imply quotation from the statute; but this was not either its language or its meaning. By the old act, *"wearing-apparel and other personal effects* (not merchandise), not including articles not actually in use and necessary and appropriate for the use of such persons for the purposes of *their journey* and present comfort and convenience," were free of duty (Tariff of 1890, sec. 752). It

was not the voyage, but the whole trip or journey; the difference is very great.

Again, at p. 524, in discussing the first great "Granger" case, Munn v. Illinois (94 U. S. 113), Mr. Hart says that the Granger movement was "checked" by this decision of the Supreme Court, and describes the judgment as being that any State regulation must be *reasonable*, and that the courts must judge whether a given rate is reasonable. Not only is this wrong, but the decision was exactly the opposite of what it is here stated to have been. The Court decided that the State of Illinois might fix the maximum of charges for storage of grain in warehouses; that the question was one "of power"; that what was reasonable compensation was a legislative and not a judicial question. So far from being a check to the Granger movement, this decision was its *magna charta*. If railroads can still look to the Federal courts for protection in these matters, it is owing to the issue of subsequent litigation, and in spite of Munn v. Illinois, not because of it. At page 357, in discussing Federal jurisdiction over "national forts and sites," Mr. Hart seems to leave the question of concurrent State criminal jurisdiction where he finds it; as a statement of law the passage is confused, and nothing more.

These instances, which have been taken almost at random, if they stood by themselves, might be of little importance; but Mr. Hart's indifference to accuracy is by no means confined to law: it runs through the whole book. Any one would suppose, from his account of the nominating system (p. 91), that "caucus" and "primary convention" were interchangeable terms. Unless caucus and primary are distinguished, it is impossible for the student to understand that the nominating system has undergone a vast change. The present congeries of nominating conventions has taken the place of the earlier order, in which, from 1800 to 1824, Presidents and Vice-Presidents were nominated by party *caucuses* of members of Congress. The earlier system was supposed to be undemocratic, because it was not representative, and was superseded by the latter. Mr. Hart's method of dealing with the subject suppresses the history, which is essential. When he writes about the "previous question" (p. 251), he confounds the previous with the *main* question, and speaks of a motion, so far as we know not hitherto even imagined by writers on parliamentary law, "that the previous question be now put." Oddly enough, not content with this, he displays the confusion in his own mind still further by adding that if this motion is carried in the affirmative, debate at once ceases, "and the 'previous'—*that is, the then pending*—question must be voted on."

In dealing with foreign affairs there is the utmost vagueness. On page 432 Mr. Hart twice states that we had a "war" with France in 1798. It is unpardonable in a publicist to describe these troubles as a "war" in the same breath with the war of 1812 and the Mexican war. The *Alabama* claims are disposed of (without being described further than as a "great international difficulty"—"the fitting out of Confederate cruisers in British ports") by saying that, after the civil war was over, the United States took up the "problem," and settled it "to its satisfaction." Our relations with Japan are summed up by saying that "in 1854 we broke in the crust of Japan and began trade with that country." This is of no use to a student, and is not supplemented by any account of the present treaties with Japan, by which extra-territoriality has been abandoned and Japan brought within the "family of nations." At page 376 the Monroe Doctrine is discussed. The writer of a book on "actual government" might have been expected to give the text of the Doctrine, but that is not Mr. Hart's way. He describes it as "some phases" of "the principle of special and paramount interest in American questions."

His account of the general foreign policy of the United States is very unsatisfactory. He gives two pages to a history of it (p. 431), and there was an excellent opportunity in such a book to exhibit it as a policy involving the substitution of arbitration for war in the settlement of disputes, freedom of expatriation and repatriation, and the support of neutral rights and duties. Whatever may be its future, no history of it is good for anything which does not give these points great prominence. We get no real history of it at all here. An instance of a very reckless use of language is the author's statement that the United States exercises "something like a protectorate" over Mexico, "not formally through the Government, but by the influence of American capital there," which "practically requires a guarantee from the Mexican Government" that order be maintained and property be respected. This is a strange sort of protectorate.

Mr. Hart is at his best in pure political description, and in this field he brings out or enforces points of importance. His fourth and fifth chapters on suffrage and elections, and party and machine, are favorable specimens of his work. What he says of the inevitable *predesignation* of favorites in any system of nomination (p. 110), of there being only one ultimate relief from the extreme evils of party organization (p. 111), and of the possibility of administering a rebuke to party leaders by staying at home (p. 111), is all good. In what he says about police (p. 575) he calls attention to a fact generally overlooked, but deserving of attention, that, except for the enforcement of liquor laws, no State has organized any system of centralized rural police, such as exists throughout England and all over the Continent.

The Life and Letters of Robert Lewis Dabney. By Thomas Cary Johnson. Richmond, Va.: The Presbyterian Committee of Publication. 1903.

In this volume of some six hundred pages is told the life story of a typical Virginian of the educated class, of the school bred under the economic and social conditions of the slave system, of which the spirit affected his whole body of thought upon theology as well as upon politics. For the old South had its peculiar atmosphere, quite unlike that of the North, created by the books it read or refrained from reading, and especially by the habitual classification of men into the born rulers and the born subjects.

Dr. Dabney was a Presbyterian theologian, with a genius for discussing with vigorous tongue or pen every other theme which pertained to the intellectual and social life of his neighbors. Born in 1820 and dying in 1898, his career covered most of the exciting debates and transactions of the rise and victory of the anti-slavery movement, around which gathered, also, many disturbances of the ecclesiastical world, for the Methodist and the Presbyterian churches fell asunder under the ferment of that great moral awakening of the nation which men of Dr. Dabney's type stoutly refused to recognize as having any moral or religious significance. For thirty years he was the head of a Presbyterian theological school, the Union Seminary of Hampden-Sidney College, an institution which he resurrected into considerable vigor from a long moribund state, but which afforded for him, as its most important work, a scholar's quiet for issuing a host of letters, articles for periodicals and books, chiefly upon subjects relating to his church and its confessions, but also covering questions of stirring interest in the domain of politics.

We are given here an entirely sympathetic, if sometimes possibly too eulogistic, account of his weighty influence in his native State, from which it appears that the term *conservative*, which is employed as a characteristic epithet for his attitude towards all problems, old and new, is quite too mild to describe a defiance of most of the views of the universe, philosophic, scientific and social, which have dominated and still control Christendom, under the Copernican astronomy and Darwin's conceptions of the development of life. His biographer, in a summary of the ideas for which he had fought for a full half-century, reports him as having been constantly

> "at war with the atheistic and infidel theories of physical science which have so largely prevailed; with the various forms of evolution, anti-biblical in their essence; with Pelagianism in every form, and Unitarianism in every shade of theology. He knew that man was never evolved from the ape; that there was a radical, fundamental, and essential difference between a man's consciousness when suffering for sin and a dog's when chastised by his master for a fault in behavior. He knew that God created the world *ex nihilo;* for God has told us so in His Word. Materialism, Herbert Spencerianism, and agnosticism are equally false. He expected confidently in God's own time the re-vindication of Calvinism. His opposition to any change of the Westminster Confession of Faith was almost absolute."

It may be added that he unremittingly opposed the reunion of the Presbyterian churches North and South; and to him is ascribed a decisive influence, by his vehement eloquence, in rejecting every proposal of peace from the Northern presbyteries. As Dr. Van Dyke, a bearer of one such plea for harmony, expressed it, "He stripped every leaf from the olive branch and made of it a rod to beat us with." And the secret of this bitterness was not so much any shade of theoretical difference between the parties as the insistence with which Dr. Dabney held, from first to last, that slavery was divinely ordained, having its warrant in the Bible, and that the Northern churches had unpardonably insulted their Southern brethern before the separation by condemning slaveholding as inconsistent with Christianity. Oddly enough, this theological controversialist was invited in the spring of 1862 to become Stonewall

Jackson's chief of staff—a function which he performed for the summer campaign, but which sickness compelled him soon to abandon. The chief fruit of that military experience was a somewhat furiously partisan life of Jackson, which has most of the defects of war history written from the standpoint of a Southerner who is in the thick of the prejudices of his class.

Altogether here is an impressive portrait, with all its virtues and blemishes, of an old-school Virginian to whom his native State was the fairest spot on earth, and his fellow-citizens of the slaveholding régime models of intelligence and manly virtue. His was undoubtedly an exceptionally strong intellect, and, the premises of the creed of his acceptance being granted, with the Bible as an inerrant guide to all truth, no man could put forward a stouter reason for rejecting every opinion based upon recent physical science or historical criticism. But Dr. Dabney belonged to an old order of faith and reason; his world from the first had been essentially provincial, as the world which defended negro slavery as divine and wise notably became alienated from most of the influences which have broadened the vision and sympathies of the rest of enlightened Christendom. The fact that men like him possessed unsullied integrity, severe conscientiousness, and utter lack of selfish ambition but added to the harm they were able to do by keeping their countrymen out of the great spiritual currents of the present century. They were essentially seventeenth or eighteenth century men.

Champlain, the Founder of New France. By Edwin Asa Dix, M.A., LL.B., formerly fellow in history of Princeton University. Illustrated. D. Appleton & Co. 1903. Pp. 246.

"What can the man do that cometh after the king? Even that which hath been already done." This utterance shows prophetic foresight of our authors who have written books about Champlain. His own narrative, penned by himself and printed while he lived, ranks among the best of unconscious autobiographies. In many ways it is analogous to the Anabasis of Xenophon. Each was the primitive reconnoissance of unknown races in a world unknown. The one has become a French classic as the other was a Greek. Parkman's life we may compare to the fullest abridgment of the ancient original, extending to well-nigh a hundred pages of Grote, while this latest effusion by Mr. Dix, and shorter volumes by Sedgwick and others, and the historic patches scattered in Winsor, Fiske, and the rest, are not unmixed with matters which, if not baser, distract attention from that continuous view of a single personality which a true biography exacts.

The original three volumes form a French pudding so rich in plums that no gatherer there has been able to carry them all away with him. The first comer naturally did his best to master the sweetest, and those who followed him, if not treading in his tracks, have snapped up trifles either unconsidered by the first gleaner, or considered by him irrelevant to his purpose, which was solely to paint his hero and his environment by characteristic touches. Mr. Dix's production seems a case in point.

A single typical example will make our meaning plain. Nineteen lines in Parkman comprise the entire existence of Madame Champlain from her first mention, a child of twelve, till her death about twenty years after that of her husband. Mr. Dix, on the other hand, consecrates a hundred lines and ten more to her marriage ceremony, with details as largely fanciful as sensational. In Sedgwick, a more brief abridger, these nuptials are granted more ample room than Parkman (whose book is much larger) gives to her whole career. The remark that Champlain's Hélène lacked the character and force to make her a real helpmeet, seems to be altogether Sedgwick's own, while Winsor holds that the marriage did not come off till ten years after the pompous function or phantasmagory.

We regard Mr. Dix's work as only an abridgment, notwithstanding his pages are no fewer than Parkman's. Our reason for thus classing it is not merely its diffuseness and peppering with condiments little needed except for claptrap, but for his scantiness of exact statements, dates, and index, and his maiming every chapter by leaving it without any itemized references to sources or key to its contents, both in the outset and all along to the end. Above all do we regret the inadequate treatment of cardinal points, as, for example, the relations of Champlain to the Jesuits and others who strove to rule or ruin him.

Parkman's 'Champlain,' a new departure in American historical narrative in 1865, within six years had reached its ninth edition, and roused for works of its class a popularity before unknown. It proved, among other surprises, that our Puritan ancestors had no sufferings to be compared with those of the first French Canadians, which nothing but French *bonhomie* could have lived through. It described a live-and-let-live policy, a *modus vivendi*, by which a superior race could settle among a weaker one and yet not destroy it. His offering was the result of patient and shrewd research at home and abroad, and led to the publication or reissue of not a few of his sources, which, if not manuscript, had become of extreme rarity. None of his contemporaries knew so much as he, through bitter experience, of that aboriginal world in the heart of which Champlain had founded New France and so laid its cornerstone that it still lives in the language, customs, and institutions of millions. He portrayed a character which readers know not whether to admire most as heroic or wise or good, greatly falling with his falling colony, but living to raise it into newness of life.

How much, at the end of forty years, has Mr. Dix added to Parkman? The first new things to strike the eye are pictorial—Champlain's wedding signature, his fifty-foot monument at Quebec, not erected till 1898, and two welcome portraits of him (one in his best years, and then as aging), though we are not told their provenance. The other five drawings—Quebec, St. Croix, and three fights with Iroquois—were all known to Parkman, but judged too puerile for reproduction, being such as a child of ten would draw, innocent of rudimentary regard to proportion and perspective. The youthful voyage to Central America, which Parkman had condensed into less than two pages, is expanded by Dix into eighteen, a chapter called "The Making of a Sailor." In order to gain verge enough for this Spanish episode, as well as for a panorama of European glories in the renascence during Champlain's first decades, there is a plentiful lack of a fitting introduction similar to Parkman's earliest adventures of the French themselves in the very quarter where Champlain's life and labors were to round out more than thirty years—above all, the traditional and historic possibilities of a pre-Columbian and pre-Cabotian discovery of America by Breton fishermen. The most thrilling addition in Dix is a single date, 1634, instead of 1639, as the year in which Nicollet, an explorer dispatched by Champlain, reached either a Wisconsin affluent of the Mississippi, or a river interosculating with it, and returned in time to gladden the last lingering illness of his great captain, and thus help him to depart in peace. How peculiarly this date was rectified with even legal proof, after Parkman wrote, we are not told, though we might have been, in a tithe of the space squandered on ad-captandum fancies or fringes.

Mr. Dix is a fascinating writer. Thanks to modernity or we know not what, in two readings we unawares came to his finis. Readers will thus often get as much from him as from Parkman, even when Parkman has given them more. It is praise enough for this most recent writer to place him in the front rank of the series of biographical followers who must all go behind the pioneer that blazed their way—the first American pathfinder and pathbreaker in the sphere of the father of New France.

Essays on Great Writers. By Henry Dwight Sedgwick, jr. Boston: Houghton, Mifflin & Co. 1903.

Such compulsory companionship among writers as we find in this volume inevitably yields one or two choice incompatibilities. Montaigne, Cervantes, Scott, and Thackeray can doubtless always forgather as men of the world, if not on a common ground of literary aims and ideals; elective affinities uniting Macaulay and D'Annunzio are not revealed through unexpected collocation. What brings these studies together is community of original appearance in a literary magazine, and an undeniably even-toned uniformity in the discussion of the respective places in literature of these famous men—from Mr. Sedgwick's point of view. His undisguised sympathies are chiefly with writers who use his own speech and frame their teaching in view of a high, yet worldly, purpose. The "kindling of enthusiasm for large causes," "power for good" (p. 39), would thus seem to be the fundamental, if not supreme, tests of the inherent worth of great literature. It is consequently without dismay that we fall (p. 231) on the otherwise disconcerting declaration: "Surely, there is more poetry in the making of the British Empire than was ever printed in France." Such a criterion might serve for a comic comparative study of the present poet laureate and Hugo.

Mr. Sedgwick's treatment of D'Annunzio is for this reason quite unsuited for serious critical discussion, inasmuch as the Italian novelist's ineradicable curiosity over pathological cases fills this transatlantic reader with equally incurable disgust and anger. D'Annunzio, as the most cursory reading will show, proceeds on the tacit

assumption that relatively virtuous and sane characters are of distinctly less importance and interest, for purposes of novel-writing, than madmen or perverts—a proposition hardly entitled to rank among universally accepted canons of fiction either in Italy or elsewhere. Still, to any one who has read as much of his work as from Mr. Sedgwick's indignant comments might appear, the incisive satire of the would-be Juvenal should be obvious. Deeper-reaching criticism might go on to point out that great satirists do not, as a rule, dwell quite so complacently on the merely voluptuous. The incongruous union (not blending) of a sharply observant satirical nature with a Southern temperament passionately exuberant has resulted in an amorphous product, interesting to placid critics, and safe enough for persons whose moral equilibrium is sufficiently stable to stand the shock of a book. But the sad-colored spectacles of the conventional moralist at his easy task obscure for him the real intensity of artistic qualities which rudimentary good taste usually prefers to discover elsewhere. And, strangely enough, several of the earlier works of D'Annunzio are themselves far more convincing examples "of the vain struggles of the primary instincts against the moral nature of man" than the two foremost illustrations that Mr. Sedgwick goes out of his way to select; for we confess to some surprise at seeing (p. 63) "Œdipus Tyrannus" and 'The Scarlet Letter' specially designated as verifying the triumph of any *moral* principle. Similarly unguarded assertions are found in the essay on Macaulay. How can any one who has read such of his letters as Sir George Trevelyan saw fit to publish, declare that Macaulay "never had the education of a great private, personal emotion"? We are also informed that "he never was in love; he never comprehended the meaning of religion" (p. 158)—apparently because he prudently kept silence on both topics.

In the essay entitled "Some Aspects of Thackeray," Mr. Sedgwick sets forth his own social and artistic convictions with a plumpness born of confidence in their strength. His estimate of the great worldly philosopher's work rests on the à-priori premises already referred to, that high purposes and a positive faith are the essentials. In both these respects Thackeray is found wanting. He impassively waived the deeper issues of philosophical and religious inquiry. "He is never . . . disturbed by any scheme of metaphysics" (p. 335); "Thackeray lacked the poet's eye; he could not see, and was not troubled" (p. 341); "Thackeray is not a democrat" (p. 342). All which is very true, but totally irrelevant if we can but accept an artist's nature as his Maker and the world together have fashioned it towards variety and individuality in art. Nevertheless, Thackeray had his own faith in nobility of personal character, in all things tending to great ideals of life and conduct, though not connected with the shadowy schemes of expansionism and chimerical personal equality. He would, indeed, have been the last of men to entertain the social-democratic idea here described as a "wish to have a ready channel from man to man through which the emotional floods of life can pour" (p. 343). We may hope that, even in a republic, there still remain some few who understand the results of his classic self-restraint and dignity. As to the hackneyed charge that his women are all fools or knaves, the rebuttal is ready in the persons of Mary Titmarsh, Madame de Florac, and Ethel Newcome. Again, if "Sir Pitt Crawley, Jos. Sedley, the struggle over Miss Crawley, Harry Foker, the Chevalier de Florac . . . are all in the realm of farce" (p. 337), surely a very thin partition divides its bounds from reality.

In "English and French Literature" the reader must not expect to find a judicial comparison of their respective merits; on the contrary, the exultant confidence in the unapproachable superiority of Anglo-Saxondom and its products inspires throughout a note like the chortle of a jubilant mother at a baby show. We can have no quarrel with the candor that inveighs against sham or borrowed admiration in literature; we are as fully aware as Mr. Sedgwick of the bogus quality in much pretentious cosmopolitanism; but the damaging admission of a resolve to read foreign literatures through English or American prejudice removes the subject from the region of argument by reducing every expression of opinion on his part to the more or less entertaining fact of a private preference. "What English-speaking person in his heart thinks that any French poet is worthy to loose one shoe-latchet in the poet's corner of English shoes?" (p. 204). Careful study of the best French prose might perhaps suggest a more effective use of suitable metaphor; it is difficult to guess how the logic might be mended when we read, as the summary of the contention, that "men who have thrown off the bias of nationality have disqualified themselves for the task"—in other words, the only comparative criticism of any weight is to come from those who deliberately shut their eyes to all qualities save those they had rather see. What we are in this dogmatic way called upon to admire is the "audacious spirit" or "adventurous capacity" in English writers, which their French rivals, it seems, have failed to develop because of their fondness for Paris and its reputed "classical benches." The whole passage (pp. 220-1) in which this strange specimen of argumentation is presented is remarkable as containing the closest-piled question-begging we have met with for long months. Want of "audacity" seems perversely inapplicable to the literature which for two hundred years has been almost a synonym for brilliant innovation; but the examples here quoted stop with Corneille, of whom it is casually remarked that he "has the nobleness of a *jeune fille*." The absence of the adventurous spirit renders it impossible for the French to plant colonies, for, "wreck them on a desert island, Villon will pick blackberries, Ronsard will skip stones, Montaigne whittle, etc." Here again the pleading is unfortunate, since not only is France to-day the second colonizing power in Europe, but one of the most striking characteristics of her explorers and travellers is a well-nigh unrivalled adaptability and inventiveness when thrown on their own resources, unhampered by bureaucracy, in an untrodden country. Nay, more: if Mr. Sedgwick had chosen to look for examples elsewhere than among the comparatively few men who support his thesis, he might have found, at random, an ample tale of French writers of distinction with capacity for practical activity as well, notably Molière, Voltaire, Bossuet, Beaumarchais, Chateaubriand, Guizot, Thiers. Systematic prejudice and paradox have their uses; not, however, as aids to literary criticism in any sense deserving such honorable designation.

The Haymarket Theatre: Some Records and Reminiscences. By Cyril Maude. E. P. Dutton & Co. 1903.

Of all existent theatres in London only two, Drury Lane and Covent Garden, are so intimately associated with the history of the legitimate British drama as the little house in the Haymarket. The present building dates only from 1820, but its predecessor, on an adjacent site, was opened almost exactly one hundred years earlier, and flourished, with the ordinary vicissitudes of theatrical fortune, until the new Theatre Royal was ready to take its place, so that, practically, the story of the two houses is one and covers a period of nearly two centuries. During this time the stage of one or the other was trodden by nearly all the most famous players on the scroll of theatrical fame, from the rascally Theophilus Cibber down to Mr. Beerbohm Tree; and it would scarcely be an exaggeration to say that the history of the Haymarket Theatre, since its foundation, corresponds with that of the British stage. Any reader expecting to find any such comprehensive review in this volume will be grievously disappointed, but if he be an amateur, unfamiliar with theatrical literature, he will be well entertained by a copious collection of anecdotes, culled from various textbooks, which are just as good now as when they were first printed. To do Mr. Maude justice, it must be admitted that he makes no pretence of being either student, critic or historian, or anything more than a retailer of gossip. He apologizes incessantly (not by any means unnecessarily) for his innumerable sins of omission and commission, and is so evidently conscious of his own deficiencies that he disarms serious criticism; but it is permissible to wonder why he should have undertaken to explore a mine of such wealth if he meant to be contented with the observations of earlier investigators.

It would not be reasonable, perhaps, to look in a superficial work of this sort for new or rare material concerning the earlier theatre. Mr. Maude chatters pleasantly enough about Charlotte Clarke, Foote, Garrick, Macklin, Bannister, Palmer, Shuter, Elizabeth Farren, the Kembles, the elder Mathews, Theodore Hook, and other notabilities, but all his anecdotes are hoary. To the two Colemans he devotes a little more space, and quotes some figures which indicate that actors and playwrights as well as the manager reaped considerable profits in the eighteenth century. Foote, for instance, drew more than £1,500 from the Haymarket treasury in 1777 in six months, although he acted for only a week. Considering the relative value of money, this compares very favorably with modern incomes. The rent of the theatre at that time was £200 a year. To the elder Coleman belongs the honor of having organized the first stock company at the Haymarket. The younger, in the later days of his career, was Examiner of Plays, and exhib-

ited much ingenuity and unscrupulousness in multiplying the fees of that office. He used to exact a separate fee of two guineas for every new song, glee or overture introduced at a benefit performance, and thereby turned what no doubt seemed to him a pretty penny. But one actor was too clever for him. He strung together all his songs, recitations, imitations, etc., in play form, and managed to get a license for them in bulk, as if they were a single piece. This must have been the origin of the modern farce comedy. According to some extracts from an old Haymarket diary or log-book, of which more would have been welcome, it appears that there was mighty little discipline among the members of the company. Both actors and actresses seem to have absented themselves at their own sweet will, and not infrequently one or more of the pieces on the programme could not be performed because important players were in the vocative. The closing days of the little theatre were the most brilliant, when Elliston, Liston, and Young, "Dicky" Suett, Dowton, Munden, Kelly, Mrs. Glover, and others scarcely less famous, constituted a veritable galaxy of talent. Mr. Maude, in writing of them, draws freely from the pages of Charles Lamb and other familiar authorities. The extracted matter is good, but not an improvement upon the original.

It is, however, infinitely superior to the trivial and often silly stuff with which Mr. Maude has filled the latter half of his book, which deals with the eighty years of the present Haymarket Theatre. With the drama, with acting, with the history of the house it has almost nothing to do. He gives the names of most of the eminent nineteenth-century players, from Madame Vestris to Mr. Beerbohm Tree, and mentions a few plays, but has scarcely a line of description, criticism, or intelligent comment, and nothing remotely resembling a comprehensive or consecutive sketch. He furnishes no lists of characters, plays, companies, or authors, attempts no comparisons of acting or managements, but confines himself to an occasional empty generality, and fills up the intervals with foolish stage stories, paltry personal anecdote, pleasant references to fellow-actors and critics, ebullitions of gratified pride at being the manager of so illustrious a temple of the drama, and other irrelevant balderdash. Although a good many pages are devoted to Benjamin Webster—one of the most powerful and versatile actors of modern times, called the English Lemaître—and to Benjamin Buckstone, who ruled the Haymarket gloriously for more than a generation and made it known the world over as the English home of high and low comedy, there is nothing in his book, except the portraits, to show what manner of men they were. The fact that he is not old enough to have had much personal knowledge of either can hardly be accepted as a justification of Mr. Maude's presuming to write about them. At least he might have published a few casts of some of the many old comedies in which Compton, Chippendale, Howe, Coe, Widdicombe, Buckstone, and others won some of the most substantial and artistic triumphs known to the London stage of the nineteenth century. The true story of the Haymarket is yet to be written, and it is to be hoped that some day a competent theatrical student will undertake the task.

History of the Commercial and Financial Relations between England and Ireland from the period of the Restoration. By Alice Effie Murray. London: P. S. King & Son.

It is unusual to find a subject such as that described in the title of this book handled by a woman. Miss Murray had a distinguished career at Girton College, was elected to a research studentship at the London School of Economics, and was one of the first woman students to obtain a doctorate in economics and political science. Her book is a useful and serious contribution to the history of the lamentable relations between England and Ireland, of special value to Irishmen as being written by an English student, and evidencing industry, care, and appreciation of economic facts.

It is a common complaint of Englishmen that the Irish are continually lamenting over the past and admitted misgovernment of Ireland instead of addressing themselves to making the best of the present conditions; but, as Mr. Hewins in the preface says, "there is no subject on which we [English] are more ignorant, or the study of which is more likely to correct extravagant views of British genius." Miss Murray shows that the present backward condition of Ireland and relative decline are largely due to causes long at work, the effects of which persist though the immediate causes have disappeared. The object of her book is to give a plain historical account of the commercial and financial relations between England and Ireland during the last 250 years, and to show how those relations have reacted on the history of the two countries and their political life.

After the Cromwellian wars Ireland was little better than a wilderness. The estimated population was 1,100,000, of whom 300,000 were English and Scotch adventurers and settlers, to whom the greater part of the land had been assigned on its confiscation from the former owners. The Protestants possessed three-quarters of the land, five-sixths of the housing, and two-thirds of what foreign trade there was. The native population was in a condition of the greatest misery, subjected to the degrading and demoralizing effects of the penal laws, and were kept so for over 200 years.

To the restrictions placed on the cattle trade, the provision trade, the woollen, cotton, glass, and other smaller industries Miss Murray ascribes the destitution, repeated famines, and misery that prevailed without intermission, as well as the present relatively backward condition of Ireland. To these were superadded the effects of the land system and the penal laws, "more subtly degrading and more demoralizing to the character of the people than the bloodthirsty enactments in France or Spain against the Protestants"; laws, in the words of Edmund Burke, "as well fitted for the impoverishment and degradation of a people, and the debasement in them of human nature itself, as ever proceeded from the perverted ingenuity of man." While export and import duties, sometimes absolute prohibition, killed trade and industry, exportation of the inhabitants was compelled or encouraged. After the Cromwellian wars "thousands of young men, boys, and girls had been sent off as slaves to the Barbadoes and Jamaica." "Between 1725 and 1728, 4,200 men, women, and children were shipped off to the West Indies alone." In such circumstances the Irish revenue was quite insufficient for the wants of the country. Small as it was, it was burdened with "an enormous pension list, of which only a very small part was given to persons resident in Ireland." All the remunerative offices in the Government, Church, and army were in the hands of Englishmen who hardly ever set foot in the country. "Pensions to Kings' favorites, and sinecure offices of all kinds, not only ground down the people by unnecessary taxes, but also perverted the morals of the upper class of Irishmen." Among those in receipt of pensions on the Irish Establishment were the Countess of Walsingham £1,200, the Countess of Lippic £1,200, Lady Betty Waldegrave £800, Lady Kilmansegg £1,250, Countess of Bellamont £1,500, Princess Amelia £1,000, Princess Augusta £5,000, Lady Yarmouth £4,000, the Queen of Denmark £3,000. Many of these pensions were, in the words of Archbishop King, "for services that, though very obliging to the person who gave the pension, yet were not proper to be alleged as motives in the grant."

The volunteer movement and Grattan's declaration of Irish rights were largely due to the effect produced on the minds of Irishmen by the American war of independence. The popular feeling in favor of free trade for Ireland was shown not only by the excitement and speeches all over the country; the volunteer artillery paraded in College Green with the motto on their cannon, "Free Trade or a Speedy Revolution." Following the example of the American colonies, "non-importation leagues" had been established all over the country. In Dublin an association of ladies resolved "that we will not wear any article that is not the product or manufacture of this country, and that we will not permit the addresses of any of the other sex who are not equally zealous in the cause of this country."

The renunciation of the legislative and judicial supremacy of the British Parliament in 1783 was followed by a short period of general prosperity in trading and industrial matters. Real free trade existed. Customs were looked on as a means of raising revenue, not of affording protection. As compared with duties still levied in England, those in Ireland were infinitely lighter, though different trades clamored from time to time for protection. The financial provisions of the Union were grossly unfair to Ireland, and proved even more unfair than had been anticipated. There was an enormous increase in the separate debt of Ireland. The amalgamation of the English and Irish Exchequers in 1826, and the imposition of indiscriminate taxation on two countries whose wants and circumstances were wholly dissimilar, was disastrous to Ireland. The poverty and misery of the Irish people culminated in 1848, and since then there has been a decrease in population from 8½ to less than 4½ millions. The greatest increase in the permanent taxation of Ireland, which was gradually assimilated to that of Great Britain, took place between 1853 and 1860; and since then, for what are called imperial purposes, taxation is practically the same on individuals in both countries.

As no separate records of the trade and commerce of the two countries have been kept since 1826, it is impossible to make any comparison between the two countries based on figures of exports and imports. Miss Murray recognizes fully the excessive burden of imperial and local taxation on the declining population of Ireland, but is inclined to look on this as a question between classes, not between the two countries as separate financial entities:

"The huge expenditure on Irish services," she says, "lies in the political and social condition of Ireland and the fact that the Government is really not conducted on a peace footing. A large number of soldiers is always kept in the country—their cost is reckoned as 'Irish services'—while the Royal Irish constabulary is in reality a standing army, and the most expensive police force in the world."

In the concluding chapters she exaggerates enormously the beneficial work of the new Agricultural Department and the Congested Districts Board, as well as the importance of some minor industries conducted partly or wholly as philanthropic enterprises. One example of this may be given: "Basket work is carried on as a cottage industry in several places; at Letterfrack in Connemara the industry is especially flourishing." This industry was started about fifteen years ago by an Englishwoman, Miss Sophia Sturge, and is carried on in a small iron building where probably there were never more than ten workers at one time. Miss Sturge learned the trade thoroughly, and turned out some excellent workmen, one of whom is said to be now doing a good business in the trade at Pittsburgh. After nine years' devoted work, Miss Sturge's health broke down, and the industry in the hands of a manager has almost ceased to be what it was under Miss Sturge's management—a useful technical school for a very small number of boys. It is difficult to buy basket work of any description in Dublin that has not come from England or France, and as a commercial undertaking Letterfrack basketmaking has never been a success.

As a whole, Miss Murray's book is unique; crammed with facts vouched by reference to the original documents—acts of Parliament, Parliamentary papers, official statistical returns—and illustrated by quotations from contemporary observers and writers during the whole period treated. The list of authorities named in the bibliography extends to twenty-two pages; there is a good index; the type is excellent. The labor must have been enormous, and the student of Irish questions has a book of great interest and of real value for reference.

Pewter Plate: A Historical and Descriptive Handbook. By H. J. L. J. Massé, M.A. With 100 illustrations. London: George Bell & Sons; New York: The Macmillan Co. 1904. Imperial 8vo, pp. xxi., 299.

Pewter, a mixture of tin with other alloys, generally a small proportion of lead, was an important metal in the domestic economy of nations for several centuries. It took the place of "trenchers treene" and wooden platters, eventually to give way to the cheaper and more easily cleaned vessels of pottery and glass. This handbook is the first to be published on the subject, in the English language at all events, following closely the issue of Mr. Welch's 'History of the Pewterers' Company' of London, to the year 1760; and to the touch plates illustrated in that work Mr. Massé has compiled a much-needed index. After explaining that the custom of recasting damaged vessels instead of repairing them was the cause of the disappearance of much old pewterware, Mr. Massé traces the etymology of the word pewter, referring to the laxity of its use in German and French under the term tin, just as copper and brass are classed together in the French *cuivre*. The sources of tin and lead are given, also a table of the various alloys which make up the several grades of pewter and Britannia metal (which is only a pewter of good quality, containing no lead). The history, ordinances, and troubles of the craft in many countries precede a description of the various vessels and the mode of their manufacture. The ware was mostly cast, to be finished sometimes by hand, sometimes by turning in a lathe. "In early times the moulds belonged to the craft guild or fellowship, and were lent to the brethren who required them, provided they knew how to make proper use of them." Many of these moulds are preserved in various museums, and the old spoon moulds of colonial days are to be found in those of this country. Domestic and church utensils are fully described and illustrated, with copious extracts from wills and inventories. Nor does the author neglect the cleaning and repairing of pewter, furnishing instructions as to removing scratches and indentations.

The most interesting chapter to the collector is that on "Pewter Marks." Whether there was any common mark of the London Pewterers' Company is not quite clear; the rose crowned, which is found also on Scotch, Flemish, Dutch, French, and German wares, and the X crowned, were stamped on the goods, not by the Pewterers' Company, but by the craftsmen themselves. The maker was compelled to register or strike his *touch* on the plate at the Hall, sometimes with his name at length, with or without a date, according to the regulations then in force. It will be evident that in most cases only an approximate date can be given to pewter vessels, as there were no yearly letters like those used by the silversmiths. The small imitation hall-marks used in addition to the maker's touch were copies of silver marks; the leopard's head, the lion rampant, and a figure of Britannia being most common. That there was always friction between the London goldsmiths and pewterers is certain. In the records of 1635, complaint is made to the Lords of the Council of pewter marked like silver, which resulted in the pewterers receiving "the order from the Lord Maior and Court of Aldren concerning the strikeing of the Marke proper to the Goldsmithes."

An inventory of the principal works to be found in the museums of Europe is given, followed by a list of touches from the five touch-plates preserved at Pewterers' Hall; miscellaneous English and foreign marks, in alphabetical order; a list of foreign makers; a bibliography (unfortunately omitting the many interesting articles published in periodicals); and finally a list of Freemen up to 1824, the date at which the last touch was struck on the plate at the Hall and the trade of pewterer had practically ceased.

Mr. Massé is to be thanked for this interesting book on an ancient craft, now extinct, or at least moribund, and of which so little has hitherto been known. For a future edition he asks for rubbings of marks, and it is to be hoped that these may be produced in facsimile by some photographic process, without trusting to descriptions alone, as in the present work.

Vieilles Maisons, Vieux Papiers. (Paris Révolutionnaire.) Par G. Lenôtre. Deuxième série. Perrin: Paris. 1903.

Those who know something of the older Paris and of its Revolutionary days will discover much fascinating diversion, and not a little instruction, in M. Lenôtre's new series of stories forming the second volume of his 'Paris Révolutionnaire.' Like the earlier collection, this is made up of painstaking studies of the minor characters who either do not appear upon the ordinary historian's stage or are named and vanish. And yet these personages are sometimes pathetic victims of the tragedy, and occasionally they play an important if obscure part. For example, here is the Abbé de Cajamano, who figured in the strange Malet conspiracy of 1812. Pasquier, who as prefect of the police barely escaped being a victim of the conspiracy, refers to him simply as a Spanish priest, and adds that a vain search was made for him after the arrest of the chief conspirators. This priest is the subject of one of M. Lenôtre's most interesting studies, which incidentally throws some light on the conspiracy itself. The story is based upon the *dossier* of the affair preserved in the National Archives. The sequel shows that in this instance Pasquier's memory was at fault, for the Abbé was not only arrested, but tried, and imprisoned until the return of the Bourbons. He was one of those poor creatures practised upon by the malignity of fortune, so dumbly innocent that when he did not stumble into the toils of a real conspiracy he was treated as too suspicious-looking a person to be trusted outside of La Force.

Another figure, fantastic, burlesque were it not real, is the Baron de Géramb, who suddenly appeared in London in 1810, and confided to the ministry his project of throwing upon the French coast an army made up of deserters from the foreign regiments serving under Napoleon. He explained that he had already armed and equipped 24,000 Croats, whom he offered to deliver at cost, including transportation to London. The Government finally deported him to Denmark, whence he was extradited to Paris and shut up in Vincennes as a supposed English spy. He ended his days as *procureur-général* of the order of Trappists. Nearly all the other sketches describe men or women of the Revolution—Madame Fouquier-Tinville, the carpenter Simon and his wife, who for a time had the care of the Dauphin, Madame Hébert, "la mère Duchesne," and others. One of the most curious chapters, describing the career of an Englishman named Greive, tells how Madame DuBarry came to be arrested and sent to the guillotine. According to M. Lenôtre's theory of the evidence, this man had been concerned in the stealing of her diamonds, and, to cover up the crime, decked himself out as an "enragé" Jacobin, and hounded her systematically until she perished on the scaffold. It should be noted that while M. Lenôtre's interpretation of the facts in such a case may be questioned,

his method of investigation is sound and exact, resting upon official records either in the National Archives, the archives of the police, or in other similar collections. As he is a successful dramatist, he has a strong sense for the points of a story.

Recent Works in History, Economics, Literature, Language, Etc.

Seager's Introduction to Economics.

By Prof. HENRY R. SEAGER, of Columbia, 560 pp. 8vo, $2.00 *net*.

This book presents in simple language the principles of Economics in vital relation to the facts and problems of contemporary business life. A distinctive feature is the introductory sketch of the rise and progress of modern industry in England and the United States. Distribution receives particular attention. Four chapters are devoted to different phases of the monopoly problem, more commonly known as "Trusts."

Napoleon the First.

By A. FOURNIER, translated by MARGARET B. CORWIN and ARTHUR D. BISSELL. Edited by Prof. E. G. BOURNE of Yale. With a full critical and topical bibliography. 750 pages. 12mo, $2.00 *net*.

"Generally recognized to be the best brief life of Napoleon ever written."—*Providence Journal*.

Roscher's Spanish Colonial System.

Translated and edited by Prof. E. G. BOURNE of Yale. iv+48 pp. 8vo. Paper 50 cts. *net*.

Tarde's Laws of Imitation,

with an introduction by Prof. FRANKLIN H. GIDDINGS, of Columbia. 404 pp. 8vo, $3.00 *net* (by mail $3.20).

A unique and brilliant work, discussing and illustrating the surprisingly large part that imitation plays in all the affairs of men in language, art, law, institutions and crime.

New Yale Studies in English

Edited by Prof. ALBERT S. COOK. Paper Covers.

The Elene of Cynewulf. Translated into English Prose by LUCIUS HUDSON HOLT. 42 pp. 8vo. 30c. *net*.

The Expression of Purpose in Old English Prose. By HUBERT GIBSON SHEARIN, Ph.D. 149 pp. 12mo, $1 00 *net*.

The Controversy Between the Puritans and the Stage. By ELBERT N. S. THOMPSON, Ph.D., 275 pp., 8vo $2.00 *net*.

Temple School Shakespeare

This series, entirely distinct from the well-known "Temple Shakespeare," is published in co-operation with Messrs. J. M. Dent & Co. of London. Edited for school use. The distinctive features include a large-type text; introductions that introduce; notes that are to the point, thorough glossaries; illustrations which both inform and stimulate. Price, 50 cents a volume *net*.

JAMES B. SMILEY, *Lincoln High School, Cleveland:* "The books as a whole are excellent and surpass every other school edition that I have seen. A pupil will be fortunate who can study his Shakespeare with such a book in his hand."

Gasc's Concise Dictionary of French and English.

By F. E. A. GASC. 941 pp. 16mo. $1.25 retail.

The most complete and recent of all the Gasc dictionaries except the LIBRARY FRENCH AND ENGLISH one.

Francois & Giroud's Simple French.

By VICTOR E. FRANCOIS, and PIERRE F. GIROUD, with vocabulary. 241 pp. 12mo. 60 cts. *net*.

The stories chosen are attractive to average pupils, and so simple that they can be taken up at almost the beginning of the course. The recommendations of the Committee of Twelve of the Modern Language Association have been constantly kept in mind.

Vos's Essentials of German

By Prof. B. J. VOS, Associate of Johns Hopkins. 222 pp., 12mo, 80c *net*.

The main facts of German grammar. There are copious exercises, limited, as far as practicable, to the more common words of the language.

Of the author's materials for German conversation Prof. JOHN S. NOLLEN, *of Iowa College*, said: "It seems to me the method of basing the conversations upon connected texts that have some interest is quite correct. The selection of material and the handling of it both strike me as excellent; what I like especially is that you give the student something to do that he can do, instead of terrifying him with the impression that the task is one of enormous difficulty."

Bierwirth's Beginning German.

By Dr. H. C. BIERWIRTH of Harvard. 214 pp. 8vo, 80c. *net*.

Thirty simple and short lessons on those essentials of German inflections and syntax which are needed to start beginners. The exercises are based on about eight hundred of the commonest words.

MISS ROSE CHAMBERLAIN *of Bryn Mawr:* "I am so pleased with the arrangement and general character of the book that I intend to introduce it into my college and school classes next year."

Werner's Heimathklang.

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages

The School List in the *Nation* has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

INTERNATIONAL MODERN LANGUAGE SERIES.
This series has long maintained a very high standard throughout the country for the practical and scholarly editing and the unequaled mechanical execution of its volumes. Recent changes in the style of binding render these books still more attractive.
Volumes which have appeared recently:
Aldrich and Foster's French Reader
Daudet's La Belle-Nivernaire
Mérimée's Colomba
Ford's Elementary German for Sight Translation
Schücking's Die Drei Freier

POEMS OF TENNYSON selected and edited by HENRY VAN DYKE
This volume, including one hundred and thirty-six selections, presents within a small compass the best of Tennyson's poems. Set apart from the mass of Tennyson's productions, they make the task of the student simple by leading him without confusion to appreciate thoroughly the vital meaning of the poet's work. The collection is thoroughly representative showing the poet at the various stages of his literary development.

GREEK SCULPTURE, Its Spirit and Principles
By EDMUND VON MACH
A thoroughly original conception of the meaning of Greek art has led to the new presentation of its several phases. This book is addressed to all students of art, to executing artists and to the general public. It is designed in the first place to give pleasure, without which the study of art is impossible. The publishers, therefore, have spared neither pains nor expense to make the book attractive and readable.

THE POLITICAL SCIENCE QUARTERLY
Edited by the Faculty of Political Science of Columbia University.
A non-partisan journal devoted to questions of current interest in politics, economics and law.

STANDARD ENGLISH CLASSICS SERIES
This series fulfils the three chief requirements of the discriminating teacher. Its volumes embody the highest editorial scholarship; they are attractively and substantially bound, and are offered at remarkably low prices.

MONEY AND BANKING *Revised Edition*
By HORACE WHITE
In this revision the author has practically rewritten the book, adding several new chapters, and bringing the whole down to date.

THE APRIL CRITIC

VOL. LXXVIII—NO. 2023. THURSDAY, APRIL 7, 1904. PRICE TEN CENTS.

Just Ready, A New Volume of

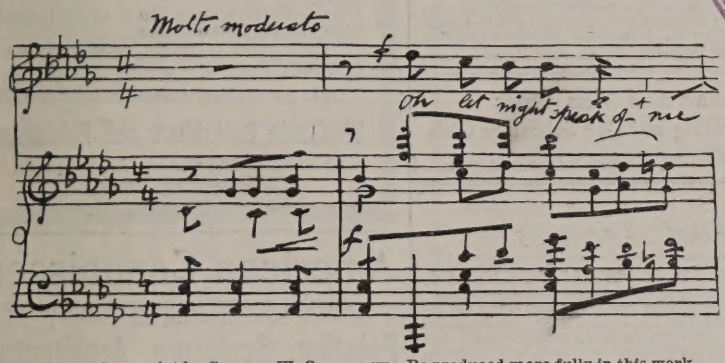
The History of American Art **Edited by JOHN C. VAN DYKE**

The History of American Music

By **LOUIS C. ELSON,** *Musical Editor of the Boston Advertiser*

Fully illustrated with photogravures, facsimiles, etc. Imperial 8vo, red cloth, gilt, in a box, $5.00 net (carriage extra)

The "History of American Art," edited by Professor JOHN C. VAN DYKE, brings together for the first time the materials for a history of American art. Heretofore there have been attempts to narrate some special period or feature of our artistic development, but the narrative has never been consecutive or conclusive. The present volumes begin with colonial times, and carry the record down to the year 1904. They are intended to cover the graphic, the plastic, the illustrative, the architectural, the musical, and the dramatic arts, and to recite the results in each department historically and critically. The series is a history of American art written from the point of view of one who practises the craft whereof he writes. and should have special value for that reason.



From a Manuscript by GEORGE W. CHADWICK. Re-produced more fully in this work.

In this "History of American Music," the second of the series, the author has told of the beginnings, the foreign influences, the changes, the methods, the personal endeavors, that have gone to the making of our present music. It has not always been possible to say a final word, even if that were desirable. In its stead the widely scattered facts have been brought together and arranged sequentially, that they might tell their own story and point their own conclusion.

Other volumes in preparation:

The History of American Painting. By SAMUEL ISHAM.

The History of American Etching, Engraving and Illustration. By JOSEPH PENNELL. Illustrated with original materials.

Previously Issued: **The History of American Sculpture.**

By LORADO TAFT. With over 100 illustrations in photogravure and half-tone. $6.00 *net.*

"If the other volumes are as generally satisfactory as this we shall have a monumental and indispensable survey of the whole achievement of American art."—THE EVENING POST, New York.

"If the other volumes come up to the standard set by Mr. Taft the series will indeed be noteworthy. It has dignity, insight, human sympathy and critical balance."—THE RECORD-HERALD, Chicago.

On NET books ordered from the publishers, carriage is uniformly an extra charge.

THE EXPANSION OF RUSSIA

Problems of the East and Problems of the Far East.

By ALFRED RAMBAUD.

SECOND EDITION

With an Essay on THE RUSSIAN PEOPLE, by J. Novicow.

Since the overthrow of the Tartar yoke Russia has steadily advanced into Western Europe, the Balkans, Siberia, and now presses on Persia, India, and China. Her policy is the key to the Far Eastern question. M. Rambaud enables the reader to realize the probable destiny of Russia.

The Nation

Was established in 1865 as a weekly review of literature, science, art, and politics, and its editorial management has been unchanged from the first. It is conducted in a spirit of complete independence. The list of contributors includes most of the leading names in literature, science, art, philosophy and law at home, and many of corresponding eminence abroad. THE NATION presents a complete and accurate record of the world's current history, with impartial comment on questions which would occupy the attention of intelligent men. To the scholar, the student, the thinker and to all professional men it is confidently recommended as an aid to sound thinking.

Subscription, $3.00 a year, post-paid. Shorter term at a proportionate rate.

Publication Office, 206-210 Broadway, New York.

RECENT IMPORTANT PUBLICATIONS

McMahon's Elementary Plane Geometry . $0.90

By **James McMahon,** Assistant Professor of Mathematics, Cornell University

This carries out the spirit of the suggestions made by the Committee on Secondary School Studies appointed by the National Educational Association, and meets the most exacting college entrance requirements in this subject. It offers a combination of demonstrative and inventional geometry. Independence of reasoning is fostered by compelling the student, no less in the demonstrated theorems and problems than in the original exercises, to rely on the propositions already proved. The work throughout aims to develop his powers of invention and generalization. The book is decidedly practical.

Chamberlain's Field and Laboratory Exercises in Physical Geography $0.50

By **James F. Chamberlain,** Department of Geography, State Normal School, Los Angeles, Cal., Associate Editor of *The Journal of Geography*

A series of laboratory and field exercises designed to lead the pupil to interpret the geographical forms and processes about him, and to give him a practical knowledge of their principles. Each exercise is preceded by a list of necessary materials, which are easily obtainable. After each exercise is left ample space for the pupil to write on the same page an account of the work done. The manual is adapted for use with any text-book on Physical Geography, and will form a valuable adjunct for practical work.

Coleman's Physical Laboratory Manual . $0.60

By **S. E. Coleman,** Head of the Science Department, Oakland, California, High School.

In this manual the laboratory work is coördinated with the class-room study, and comprises eighty-one exercises, so arranged that the book can be used either with simple apparatus, or with a more fully equipped laboratory. The matter in connection with each experiment consists of:—1. A definite statement of the object of the experiment. 2. References to leading text-books in physics, indicating profitable reading. 3. A list of the apparatus required. 4. Directions, suggestions, form of record and discussion of the experiment.

Dodge's General Zoölogy $1.80

By **Charles Wright Dodge,** M.A., Professor of Biology, University of Rochester.

This presents the established facts and principles of zoölogy with great clearness and in a manner somewhat different from that of other manuals. The first part consists of a course in practical zoölogy, composed of suggestions and directions for the laboratory and field study of a carefully selected series of animals, representative examples of the groups to which they belong. The second and third parts are devoted respectively to a systematic treatment of the animal kingdom, and to a comparative study of the organs and functions of animals.

Bolles's Money, Banking and Finance . . $1.25

By **Albert S. Bolles,** Ph.D., LL.D., author of "Practical Banking," etc., and Lecturer in the University of Pennsylvania and Haverford College.

A brief, practical treatise on the Theory of Money, the Practice and Usages of Banking, and the Principles of Finance. The author describes the best banking practice of the day, and adds those legal principles which refer to the topics taken up. This book will appeal alike to those who intend to devote themselves to the business of banking, to those who are thus engaged, and to those who are studying the history and theories of banking.

The MERRY ANNE

Mr. SAMUEL MERWIN'S breezy novel is a story of the Revenue Service on the Lakes, full of lively action. The author was one of the collaborators in "Calumet 'K.'" Illustrated and decorated by THOMAS FOGARTY. *Cloth, $1.50.*

Ready next week.

The Court of Sacharissa

A MIDSUMMER IDYL.

Messrs. HUGH T. SHERINGHAM and NEVILL MEAKIN have "compiled from the traditions of the Irresponsible Club" this graceful piece of delicate fooling, delicious in its humor. *Cloth, $1.50.*

Ready April 20.

Daughters of Nijo *by*

ONOTO WATANNA, author of "The Wooing of Wistaria," gives an unusually interesting view of the Imperial court of Japan. *Illustrated in colors and decorated by Kiyokichi Sano. Cloth, $1.50.*

A new book by the author of "The Call of the Wild."

The Faith of Men

Mr. JACK LONDON'S new volume of short stories shows again the rare versatility of the man who in one year wrote "The Call of the Wild," "The People of the Abyss," and "The Sea Wolf." *Cloth, $1.50.*

Second Edition.

The Adventures of Elizabeth in Rügen

By the author of "Elizabeth and Her German Garden," etc. "Merry and wise, clever and lovable."—*New York Times.* *Cloth, $1.50.*

Fourth Edition.

The American Prisoner

Mr. EDEN PHILLPOTTS' new romance of the West Country. Illustrated by CLAUDE A. SHEPPERSON. *Cloth, $1.50.*

The Price of Youth

Miss MARGERY WILLIAMS'S wonderful sketch of a New Jersey girl is clever in its wit, keen in its underlying tragedy. *Cloth. $1.50.*

The Day Before Yesterday

Mrs. SARA ANDREW SHAFER'S irresistible story is "half humorous, half tender, wholly delightful," in its subtle understanding of a child's point of view. *Cloth, $1.50.*

The Story of King Sylvain and Queen Aimée

Miss MARGARET SHERWOOD'S contribution to the literature of pure joy. With illustrations in tint. *Cloth, $1.50.*

NEW MISCELLANEOUS BOOKS

By EDGAR GARDNER MURPHY

Problems of the Present South

A Discussion of Certain of the Educational, Industrial and Political Issues of the Southern States.

Cloth, 12mo, $1.50 net. (Postage 11c. extra.)

Dr. JOHN W. STREETER'S

The Fat of the Land

is the genuine story, with facts and figures, of the development of a neglected, run-down American farm into a paying investment.

"An exasperating book," *The Cleveland Leader* calls it, "because it awakens such envy. But it is also charming, and should be enthusiastically recommended."

Third Edition. Cloth, 12mo, $1.50 net. (Postage 12c. extra.)

By H. H. HORNE, Ph.D. *Dartmouth College*

The Philosophy of Education

Being the Foundations of Education in the related Natural and Mental Sciences. *Cloth, 12mo, $1.75 net. (Postage 11c.)*

Mrs. HUGH FRASER'S *delightful*

Letters from Japan

Cheaper edition. In one volume.

"Nowhere else do we get so closely into touch with the actual Japanese men and women—yes, and children, too—as in this book."—*The Outlook.*

With all the 250 illustrations of the $7.50 ed. Cloth, $3.00 net

By WIRT GERRARE

Greater Russia

The Continental Empire of the Old World

"Mr. GERRARE'S book, dealing with matters of his own observation, is extremely careful and accurate."—ARCHIBALD R. COLQUHOUN. *Cloth, illustrated, 337 pages, $3.00 net, (Postage 22c. extra)*

By A. R. COLQUHOUN

Special Correspondent of the London "Times" in the Far East.

The Mastery of the Pacific

Illustrated. $3 00 net. (Postage 30c.)

"The most important book on the general subject of the Far East that has been issued." —*Brooklyn Eagle*

On NET books ordered from the publishers, carriage is uniformly an extra charge.

THE MACMILLAN COMPANY, Publishers, 66 Fifth Ave., New York

The Nation.

NEW YORK, THURSDAY, APRIL 7, 1904.

The Week.

Judge Parker will not be tempted to interpret the marked turning of Democrats all over the country to him, which, as all can see, makes his nomination at St. Louis highly probable, as a personal compliment. It is not magnetic leadership which draws all eyes to him, not popular qualities, not oratory nor enthusiasm, nor even a skilful political organization, but chiefly the anxiety of his party to find a deliverer. An unprecedented combination of ignorance and insolence, of wealthy vice and reckless agitation, had been formed to steal a march on decent Democrats and capture the Presidential nomination before they woke up. It is the growing horror of this Bryan-Hearst conspiracy which has led the unbought members of the party to look so eagerly to Judge Parker. He has appeared to them available; he has stood for that dignity and honor of the party which Hearst and Bryan would drag in the gutter; and, with his own State now united in his support, honest Democrats everywhere are thinking of him as the best man with whom to beat off the degraded corruptionists seeking to buy and prostitute the Democracy. It is already a great triumph for decency. We now look to see the Bryan-Hearst movement sink rapidly into ridicule and impotence. Its only chance of success lay in its audacity and unscrupulousness, and in the hope of its promoters that Hearst, having named himself for the Presidency and resolved to buy his way to the White House, would be treated as if he were a reputable citizen. But the truth has been told. He has found that money will buy everything but character, and that character still counts. The self-respecting and unbribed elements of his party are showing him that they will none of him; and a speedy concentration upon Judge Parker will soon leave him as soundly defeated as he is already hopelessly discredited.

Mr. Bryan's insistence that the State of New York is not necessary to Democratic success is simply childish. Indeed, we should be ashamed of a well-grown child that could not take pencil and paper and figure out the absurdity of the statement. Mr. Bryan ought to go to Washington and produce his table of electoral votes, with New York left out, for the benefit of Democratic Congressmen. Their unanimous opinion is that a candidate who could not carry New York would be beaten before he began. That is the reason why all eyes turn to this State, and why the Democrats of the South and West are so outspoken in saying that if the party in New York is united for Judge Parker, they will fall in line and make him the nominee at St. Louis. But, of course, when Mr. Bryan says "success" he does not mean winning the election. That is the last thing he cares for. He will count himself successful if, by any means, even the vilest coalition, he is able to control one-third of the delegates to the convention, and so to throw himself athwart the path towards sanity and victory at the polls. Every day brings out more clearly his attitude of rule or ruin. But every day also makes it more plain to the party that it must shake off a leadership which has advanced rapidly from disaster to disgrace.

The Vice-Presidency is now the career that is open to talent. Gov. Van Sant of Minnesota is being pushed by his friends for the place; and Iowa renews the talk of Secretary Shaw. The trouble is said to be the vacillation of Senator Fairbanks of Indiana. Roosevelt, according to all reports, has chosen him as a running mate, and has issued peremptory orders to Indiana to get enthusiastic over Fairbanks. But, unhappily, the Senator—unlike his vivacious colleague, Beveridge—is not a man who either acquires or inspires enthusiasms. Indiana, imitating Margery's bereaved hen, remains "more than usual calm." While constituents continue apathetic, the cool and calculating Mr. Fairbanks keeps his eye on 1908, and halts between two opinions: whether he stands a better chance for the Presidency by remaining Senator or becoming Vice-President? What is wanted in the second man on the ticket is a heavy respectable, to whom the spellbinders can point as a model of sobriety and conservatism—a fitting foil for Mr. Roosevelt's strenuousness. Any gentleman who can fill these specifications will hear of something to his advantage by communicating in strictest confidence with T. R., White House, Washington, D. C. No man under fifty need apply.

Representative Overstreet is getting into water that is both hot and deep. Postmaster-General Payne declares that he originally sent to Mr. Overstreet, chairman of the House Committee on Post-Office and Post Roads, a list of "cases" without the names of Congressmen attached. Mr. Overstreet was not content, and in writing demanded names, which were accordingly furnished. And, finally, Mr. Payne charges that the dates of two letters have been changed so as to make it appear that the Post-Office Department, and not Mr. Overstreet's committee, is responsible for dragging statesmen into undesired publicity. In short, according to Mr. Payne's testimony, Mr. Overstreet, or some wicked partner, is the cause of all the woe since the "Charges against Members" was published to a scoffing world. This new development in the scandal only makes it the more evident that a suppression of investigation by the Republican majority will put a terrible weapon into the hands of the Democrats.

Mr. Bonaparte of Baltimore is the wrong passenger to wake up. Ex-Postmaster-General Smith made the mistake of sneering at his report on the postal frauds, and got a rejoinder which would have permanently suppressed a less exuberant person. Now comes Senator Gorman, caustically referring in the Senate to Mr. Bonaparte as a "professional reformer." Immediately we hear the swish of a sabre from Baltimore. "If I am a professional reformer," remarks Mr. Bonaparte, "Senator Gorman is nothing but a professional lobbyist." He further invites a comparison of the pecuniary profits derived from the two occupations. This may be called twitting on facts, but the Maryland Senator laid himself fairly open to it. He has been guilty of such indiscretions before. When Mr. Roosevelt was Civil Service Commissioner, he once brought Gorman to book handsomely. The latter's ignorance, or malice, was put in the clearest light, and Mr. Roosevelt's letter about "clinging, trustful Senator Gorman" excited much merriment.

Let no misguided campaign committee claim Panama honors for the President. Mr. Roosevelt, like the Colombians, the Nicaraguans, the United States Senate, the French Panama Company, and the Panameños, was merely a tool in the hands of Philippe Bunau-Varilla. Should anybody ask us how we know that Bunau-Varilla was the god from all the Panama machines, we answer that he admits it himself. In an interview with Jules Huret of *Figaro*, he recounts with exemplary candor all the stages of his triumphant negotiations, from the heyday of the Nicaragua scheme that was, to the statue of De Lesseps that M. Bunau-Varilla is to accept in lieu of an ambassador's pay. Three times Bunau-Varilla came to America—once to circulate his pamphlet 'Panama: Past, Present, and Future'; again to present the Panama Company's offer of sale, 1902; still once more to convert Senator Hanna, "homme d'une probité indiscutable et jouissant

d'une très légitime influence sur le Congrès." On this occasion M. Bunau-Varilla succeeded in getting the Panama route accepted as an alternative by Congress. Among those Congressmen who doubted there were volcanic disturbances in Nicaragua, he circulated the Nicaraguan postage stamp bearing a great volcano in active eruption. An actual eruption came opportunely to his aid. "J'avais l'air de commander aux élémens," he says, with fine simplicity. When the Hay-Herran treaty was ratified by the Senate, M. Bunau-Varilla returned to France "reassured."

But this well-earned ease was rudely broken by the hideous plot of the robber politicians of Bogotá. For the fourth time M. Bunau-Varilla returned to America, resolved on closing the matter up at all hazards. The moment was opportune. The Panameños only needed to be reminded of their oppression to rise. "I got in touch with the representatives of the Isthmus at New York; I believed it my duty to advise the revolution. They believed me, and effected it." The appalling speed with which event followed event in the early days of last November is now matter of history. Only M. Bunau-Varilla's comment on Gen. Reyes's tardy arrival, as plenipotentiary at Washington, deserves to be added to the record. Reyes "was too late. Not only was the dinner served, but eaten and digested. I had finished." This is the narrative that M. Bunau-Varilla in all soberness ("après les premières effusions") gives to *Figaro* and to the world. Truth, as usual, puts fiction in the shade. Mr. Roosevelt's part in the transaction is reduced to a fortunate conjunction with the dominating planet of Bunau-Varilla with a canal to sell, and this old wives' tale carries with it a ghastly suggestion that it is the inner truth of last November's bunco game.

It is but an expected decision which the French court renders against the Colombia shareholders in the Panama Company. Their suit, however, was the least of the legal difficulties in the way of the transfer to the United States. The vexation at Washington, the friction between members of the Cabinet, the array of Government counsel dispatched to Paris, signify an obstacle far different and more awkward. This is, we understand, nothing less than the discovery that the Panama Company has never really agreed to sell out for $40,000,000. Its committee reported in favor of that proposal, but the requisite formal action was not taken. Consequently, this country is in the pleasing situation of having bought property for which the price has not been fixed. This accounts for the angry talk about what the Administration will do if the Frenchmen attempt a "hold-up." The whole case is certainly one of brilliant management. First, we announced to Colombia that we had decided on the Panama route, and then blandly asked her what she would take for it. Next, having ridden over Colombia's rights, we turn to the Panama Company with our $40,000,000, only to find that it has never agreed to that sum. Doubtless the snarl will be unravelled; but what a policy of blunder!

After the corner in Northern Pacific stock, three years ago, under the purchases of the two rival interests, it was found that, out of the $155,000,000 Northern Pacific stock, the "Harriman party" controlled $78,108,000, or more than half, while the "Hill-Morgan party" controlled the bulk of what remained. Confronted with the disastrous results of a corner operation, the Northern Securities expedient was contrived. The Harriman interest turned over its Northern Pacific stock in exchange for Northern Securities shares and $8,900,000 cash—the cash, apparently, being paid by the rival interests. The Hill-Morgan interest turned into the merger what it had of Northern Pacific stock, and some $124,000,000 stock of the parallel Great Northern. Obviously, therefore, with Northern Securities stock exchanged for both Northern Pacific and Great Northern shares, that interest held the larger part of the stock in the merger company.

That company having been declared illegal, two methods of dissolution theoretically existed—one, to restore the absolute *status quo*, so that each individual participant in the merger should receive exactly the shares which he deposited, whether Northern Pacific or Great Northern; the other, to distribute the Northern Securities assets pro rata, each shareholder receiving his due proportion of the stock of both these companies. The second of these plans has been officially proposed, on the ground that, since Northern Securities stock has been largely bought and sold on the open market, restoration of the *status quo* is impossible. But the Harriman interest demands that it be restored precisely; intimates that the official plan may be illegal; and offers, for its own part, to return the exact share certificates which it received for its Northern Pacific stock. This it is able to do because it borrowed, on the credit of a railway owned by it, the money for the Northern Pacific purchase, and because it has tied up in a collateral trust the shares which now represent that purchase. The court is asked to decide between the two schemes of dissolution, and it is possible that voting control of the Northern Pacific will be settled, as between the two rival interests of 1901, in that way. This fact should be enough to put the public on its guard.

Friday's holiday in the anthracite region shows what a makeshift the 1903 agreement between the operators and miners was. April 1 was the anniversary of the day on which the soft-coal miners achieved their eight-hour victory. The anthracite workers have not yet reached this goal, but they decided, at the instigation of President Mitchell, to celebrate just the same, although the operators had declared that there would be no holiday. Mass meetings were held in different localities, and the speakers asserted that the next move should be for an eight-hour day and for the payment of coal by weight. In short, the purpose of the miners to strike again in 1906 was clear. This vividly recalls President Roosevelt's letter to the Strike Commission in 1902. These were his words: "You will endeavor to establish the relations between the employers and wage workers in the anthracite field on a just and *permanent* basis." The Commission awarded the miners a nine hours' day with a ten hours' wage, and a three years' agreement between the operators and the men was arranged. President Roosevelt may have considered the compact final, but it is now manifest that the miners regarded it merely as a truce. They had obtained all that was possible for the moment, and were prepared to bide their time. Thus we see that the people of the United States must get rid of the idea that any real relief from the exactions of organized labor is in sight.

The committee of the National Woman's Trade Union Label League, which asked President Eliot why he refused to allow his speech on labor to be published under the union label, received the answer which might have been expected; he objected because the label condoned the closed shop, and the closed shop implied the denial of free competition. Why the committee thought it worth while to put the question is one of the insoluble "mysteries of a woman's heart." President Eliot is the strongest advocate of individualism in this country. His theory of education postulates the right and the necessity of allowing the individual to bring his peculiar talents to their highest possible development. The good of society, he maintains, is subserved not by uniformity of product from our schools, but by variety. This principle of training each person to the task for which he is specially fitted President Eliot would apply to the whole course of education. In college he would throw large responsibilities on the student and teach him to choose and act for himself. He would have the world also an open field, where each professional man or manual labor-

er shall be free to produce the largest amount of the best quality within his power. The trade union, in so far as it limits the output and prescribes hours and qualities, reduces the most swift and skilful to the dull level of mediocrity. It is this side of unionism which President Eliot has rendered great service to his generation by assailing.

The Chicago *Tribune* has been making a strong effort to get at the real facts in the case of the St. Charles, Ark., race riots, in which thirteen negroes were killed. It sent one of its staff correspondents to the scene of the butchery, and after a week's investigation he has printed a story which, as the *Tribune* truly says, is almost incredible in its horror. The town of St. Charles has a white population of 200 or 300, the blacks numbering 500 or 600. The *Tribune* correspondent does not speak very highly of the latter. Their fondness for drink and the game of craps is especially noted. These shortcomings bring them into dangerous relations with "low-down" whites, for whom whiskey and craps have also unlimited attractions. The whites chew off the same plug with the negroes, they drink out of the same bottle, and they gamble with them. In the words of a prominent citizen of the locality, when a white man does that the negro is the better of the two. Now, the St. Charles butchery grew out of a drunken quarrel between a white man and two negroes over craps. The negroes made the mistake of supposing that, as they were good enough to drink and gamble with, they could adopt a general attitude of familiarity towards their Caucasian associate. They tried it, and quickly realized their mistake. Subsequently they assaulted him and his brother, and a race war began.

A reign of hysteria set in. The old, inoffensive, ante-bellum negroes, knowing what was likely to happen, flocked to town, and offered to give up their guns. Everybody has a gun in that region, on account of the abundance of game. These old blacks knew that the possession of firearms rendered them liable to assault in a time of excitement. Furthermore, they lost their heads through fear, and told stories about a secret society among the younger negroes for the purpose of overpowering the whites. There was probably no real foundation for the report, but, as the *Tribune* correspondent says, the white men took no chances. Indeed, their panic seems to have equalled that of the blacks. Armed with guns and pistols, they began the work of gathering in the negroes and locking them up in a store belonging to one of the latter. Even the peace-loving blacks thereupon took to shooting. The climax came when a body of white men surrounded the place where thirty-three negroes were confined, and, calling out six, shot them as an object-lesson to the others. The Northern reader will, of course, be shocked by this account; but the Chicago *Tribune* correspondent says that the better class of white men in Arkansas County—and perhaps even Bishop Brown—"if not equally shocked," are grieved and indignant "at the length" to which the feud has been carried. The incident shows that the vicious whites are as great a menace as the blacks, and that in many parts of the South the action of the community is governed, not by the calm judgment of the white element, but by hot-headed boys and young men.

Premier Bond's statement that no correspondence respecting the consolidation of Newfoundland with Canada has passed has presumably more than personal weight. For the first time in her existence as a colony, Newfoundland is assured of the extinction of the vexatious French rights. It is natural, then, that she should wish to find herself in her new liberated estate before sinking her political entity in that of the Dominion. For the present, the annexation scheme will probably halt, though it seems inevitable that it should finally be effected. Meanwhile it should not be forgotten that the relations of Newfoundland with European countries and with the United States are really closer than those with the Dominion. In particular, there is a growing trade between our ports and theirs. This might be greatly increased by the passage of the Hay-Bond convention, a measure which deserves to be approved for its own sake and for its value as an entering wedge whenever the union between Newfoundland and the Dominion shall be accomplished.

There are more reasons than one why Mr. Balfour should regard the present state of British finance dejectedly. The Government's fiscal year closed on Thursday under a cloud. In April, 1903, Mr. Ritchie, then Chancellor of the Exchequer, estimated that the revenue for the coming twelve months would be £144,270,000. The actual result, however, has been only £141,546,000. That is, the estimates have not been reached by £2,750,000, or about $13,750,000. There has been a shrinkage in about every branch of the revenue, except the Post-Office, which up to March 12 had registered a gain of about £1,400,000 over the estimate for the full year. The larger part of the loss has fallen on the receipts from the income tax. Up to three weeks ago these had amounted to only £26,777,000, against Mr. Ritchie's estimate of £30,500,000 for the year. In customs there was a decline of $12,500,000, while the excise returns showed a decrease of $15,000,000. An increase of at least a penny in the pound in the income tax is of course to be expected, and it is predicted that the duties on sugar and tobacco will be raised. It is also feared that the Sinking Fund will have to be suspended in part. The question of raising additional revenue is in itself an ugly one. While the Government has been increasing its expenditures on an enormous scale, it has also been adversely affecting general money conditions, thereby reducing profits and impairing the effectiveness of the income tax.

But this is the least of the evils that confront the present Government. It is common opinion that the heavy expenditures have come to stay. The South African war revealed the rottenness of the army administration, and the need of large appropriations for an efficient army can no longer be put by. Imperialistic ideas necessitate maximum expenditures on the navy. And, of course, the Irish land scheme and the educational measure have greatly added to the burdens of the Government. The people may tolerate an income tax of 12d. in time of peace, but their willingness to go higher is doubtful. That the Government will have to take refuge in a widening of the basis of indirect taxation seems likely. The discussion on the new budget is due in the next few weeks, when the whole question of the future revenue policy of the Kingdom is very likely to be brought up. While "the City" expects a wider basis of taxation, there is a strong feeling that this should be strictly for revenue purposes. But is it conceivable that Mr. Austen Chamberlain can propose any material departure from the present revenue methods without at once precipitating that debate on the question of preferential duties which Mr. Balfour is so anxious to avoid?

The Japanese Government has at last allowed a number of war correspondents to join the army in Korea. That probably means that the concentration is completed and the line of attack so plain that nothing is to be feared from revelations in the press. It seems, however, that the strict censorship has been relatively of little avail. If it has been difficult to trace minutely the Japanese advance from Seul, there has never been any reasonable doubt that the main force was following the route of 1894. It now appears that Japanese scouts have reached Wiju, and the preliminary stage of the war is practically over. It has been a matter of some surprise that the Russians have not opposed the Japanese advance through the mountains. At many places a small force could have blocked the way for days or weeks. The waiver of a campaign in Korea bears out those who believe that the effective force of the Russians has been grossly overstated.

EXTRAVAGANCE AND ECONOMY.

Several noteworthy speeches have lately been made in Congress on economy. Representative Hemenway's has probably commanded most attention, by reason of his position as chairman of the Committee on Appropriations. It should, however, be read in the light of the previous address of Mr. Burton of Ohio. The latter showed that the wealth per capita of the United States had increased much faster in the last fifty years than the burden of national taxation. But he considered this no excuse for extravagance; on the contrary, it should lead us to adopt a policy of conservatism. He questioned whether it was not essential that the burden of taxation should be decreased from year to year, "so that the standard of living may be raised, and capital may always be ready for the development of commerce and industry and for increasing the wealth of the people."

Mr. Hemenway has made an attempt to practise what Mr. Burton has preached. In presenting the Sundry Civil Appropriation bill—the last of the general appropriation bills—he stated that his committee worked out a reduction of $17,147,116 from the estimates submitted to it, and of $28,915,208 from the total voted for the present fiscal year. In his last annual report the Secretary of the Treasury estimated the revenue for 1905 at $704,472,060, and the expenditures at $727,474,206. But the chairman of the Appropriations Committee refused to accept these figures. He has cut the appropriations down to $682,774,144, or nearly $22,000,000 under the estimated revenue. A part of this saving is due to the omission of a river and harbor bill.

In these economies the Appropriations Committee has taken a step in the right direction, and the nation should be duly grateful. It has tried, in a measure, to stem the tide of extravagance which has been rising with such great force of late. Yet it has fallen far short of doing all that is needed. This is clearly seen when the reductions are studied in detail. Appropriations for public buildings have been reduced $7,955,550, those for river and harbor contract work $12,355,950, and those for the national homes of disabled volunteer soldiers $1,112,124. Furthermore, the last Sundry Civil act carried an unusual number of items that need not be continued another year, ranging from $100,000 upwards and aggregating nearly $7,000,000. Everything counts, and all these gains are to be welcomed. But, after all, the waste still goes on at the bung while a saving is attempted at the spigot.

What the country needs is a true spirit of economy. The reductions made by the Appropriations Committee in the estimates for 1905 denote economies, but they do not indicate that either Congress or the nation has any desire for real economy. To understand what that means one should read Representative Burton's speech. He refers, among other things, to the demand for good roads. It is not pretended that these have to do with interstate commerce, but they would enable the farmers to get their products to market more readily and would confer a social benefit. Mr. Burton points out that "expenses are most judicious, are most carefully applied to public objects, are disbursed most economically and efficiently when and in proportion as there is an immediate local interest in the use to which they are applied." But the tendency is strongly in the direction of foisting on the national Government schemes which should properly be undertaken by local and even private interests. Various Congresses have appropriated nearly $26,000,000 for expositions, more than half this amount having been voted in the last six years. Representative Burton asks if this class of Government expenditure should not be abandoned.

Chairman Hemenway does not say anything about greater carefulness in the matter of pensions, but a reform there would be in line with true economy. He has figured a surplus of $22,000,000 for 1905; but how is this result going to be affected by the new pension ruling? The Secretary of the Interior says that the disbursements on this account will be increased $5,400,000, but there is no certainty that they will not be swelled by several times that amount. Representative Miers of Indiana has figured that they may be $14,000,000 larger. Representative Burton sees the danger of the pension situation. He says: "Under what rule should this appropriation be made? Are we willing to establish in this country the standard that for patriotism, for devotion to country, the reward and the chief reward must be in dollars that are raised by national taxation?" He also attacks the rural free-delivery expenditure, which has increased from $448,000 in 1900 to $8,000,000 in 1903, the estimate for 1905 being $20,773,700. This service, he asserts, costs nearly five times as much as the revenue derived from it. It is in the matter of pensions, rural delivery, and a big navy that one looks for the real evidence of national extravagance. Regarding such outlays, the Appropriations Committee has nothing to say. The best it is able to do is to stop up a few small cracks, and to put a plug in one good-sized hole. Evidently, the main thing with Congress is not economy, but merely to prevent a deficit from looming up in sight in a Presidential year. That it will succeed in doing even this is by no means certain.

NEW LAW FOR OLD REPUDIATORS.

It is now some twenty-two years since the last effort of an individual bondholder to collect his money from a repudiating State failed in the Supreme Court; and it is almost as long since the last angry investor sought the columns of the *Evening Post* to pour the vials of his wrath upon those Southern States which had borrowed money from him and refused to pay it back. These bonds—many millions of them—defaulted and ignored, with their big sheets of uncut coupons, have lain in dusty pigeonholes; and repudiation, as a national issue, has seemed almost as much a matter of history as abolition or reconstruction. But some brokers in this city seem to have found a way to turn these repudiated bonds into cash, even though the bondholder himself has only the satisfaction of the angry creditor who says to his lawyer: "Collect this debt and you can keep all you get." South Dakota holds, in the present instance, the place of the collecting lawyer.

The decision in the case of the State of South Dakota vs. the State of North Carolina, recently handed down by a divided Supreme Court, places the repudiated bonds upon an entirely new footing. It would be going too far, of course, to assert that this decision gives these bonds full standing and a value in the market; but it is well within the facts to say that it makes many of them available as cash for some purposes, and that it suggests the possibility of another decision which may make certain issues of them fully collectible. It all hangs, of course, upon the Constitutional provision that a State cannot be sued by a non-citizen, while any State may sue a sister State.

In the spring of 1901, the Legislature of South Dakota passed a most unusual bit of legislation, clearly suggestive of the events that followed. The character of the statute is sufficiently indicated by its title: "An Act to Require the Acceptance and Collection of Grants, Devises, Bequests, Donations, and Assignments to the State of South Dakota." A few months later Mr. Simon Schafer, a New York broker, addressed to the Hon. Charles H. Burke, member of Congress for South Dakota, a letter which set forth that he "had decided, after consultation with the other holders of the second-mortgage bonds of the State of North Carolina, to donate ten of these bonds to the State of South Dakota." The letter went on to say that the holders of these bonds had waited thirty years in the hope that North Carolina would pay; that the bonds were all due, together with an accretion of 170 per cent. of interest; that the holders had been advised that they could not sue North Carolina themselves, but that South Dakota could; and the communication ended by saying that "the owners of these bonds are mostly, if not entirely, persons who liberally give charity to the needy, the

deserving, and the unfortunate. These bonds can be used to great advantage by States or foreign governments; and the majority owners would prefer to use them in this way, rather than take the trifle which is offered by the debtor. If your State should succeed in collecting these bonds, it would be the inclination of the owners of a majority of the total issue now outstanding to make additional donations to such governments as may be able to collect from the repudiating State. The donors of these ten bonds would be pleased if the Legislature of South Dakota should apply the proceeds of these bonds to the State University or to some of its asylums or other charities."

South Dakota proceeded at once to sue on the bonds. North Carolina defended, and, after holding the case under advisement for some six months, the court reached a decision. Justice Brewer, who wrote the prevailing opinion, had clearly in mind the nature of the transaction between Mr. Simon Schafer and South Dakota. "Apparently," he says, "the statute of South Dakota was passed in view of the expected gift, and probably the donor made the gift under a not unreasonable expectation that South Dakota would bring an action against North Carolina to enforce these bonds, and that such action might enure to his benefit as the owner of other like bonds." But he held that South Dakota was, bona fide, the owner of the bonds; that, therefore, the Supreme Court had jurisdiction of the case as one between two States; and he decreed that "the State of North Carolina pay to the State of South Dakota the said amount (twenty-seven thousand, four hundred dollars), with costs of suit, on or before the first Monday of January, 1905."

From this opinion and decree Justices White, Fuller, McKenna, and Day dissented. They doubted whether the Supreme Court had jurisdiction in the suit as one between two States. To put it roughly, they questioned the good faith of the donation from Schafer to the State. Moreover, they contended that the original owner could not give to the State more than he had, and that he had nothing, because, in the language of Justice White, "whilst the contracts of a sovereign State may engender natural or moral obligations, and are, in one sense, property, they are yet obligations resting on the promise of the sovereign and possessing no other sanction than the good faith and honor of the sovereign itself." The dissenting opinion is vigorous in tone and worked out with much elaboration and undeniable power.

But the decision is that North Carolina must pay. Let no investor, however, be moved by this to drag his long neglected State bonds from old desks with a vision of unexpected windfalls. First, give your bonds to a State. Then, too, these bonds are of many issues, of many kinds, and of differing conditions. Undoubtedly a great many of them are similar to the ones just passed upon; for such the present decision will of course be a binding precedent. As to others, only the actual test or trial will show whether they can be collected in the way South Dakota has gone about it.

REMEDIES AGAINST UNIONS.

According to a dispatch from Joliet, Ill., the Bates Machine Company of that place, having got an injunction against the Machinists' Union and its members, has brought a suit for $200,000 against the same defendants. This is one of a number of such suits reported in this country within a comparatively recent period, for the purpose of applying to labor unions the same responsibility for the consequences of their acts as have the courts of England under the well-known Taff Vale decision. Without going into technical details, the principle involved is that, whether incorporated or not, unions and their managers, while they may strike and agitate as much as they please, cannot make use, as part of their machinery, of agencies which directly interfere with employers' rights of contract or of property. If by intimidation (*i. e.*, threats of violence) they block the means by which the employer carries on his business, they must answer for it; and the persons responsible are those who cause the damage, whether they call themselves a union or not. In all cases of this sort in which a union is one of the defendants, the importance of the principle invoked lies in the fact that the funds of the union may be levied on. Verdicts for damages against walking delegates would usually amount to little. Judgments collectible out of unions' funds are another matter.

Such suits, if maintained, are the common-law remedy which the injunction, obtained on the equity side of the court, rounds out and completes. The criminal law affords a third means of redress which is familiar to everybody. If the acts complained of or threatened amount to breaches of the peace or illegal violence, the sheriff and the posse, and in the last resort the military, may be called on to preserve order and remove or prevent any obstacles to the ordinary movement of business and employment of labor. But the sheriff and his posse, and even the troops, especially if they are local militia, may sympathize with those whom they are called out to keep in order, and hence greater and greater reliance has come to be placed in the civil remedies—but with this difference: that in the United States injunctions have been resorted to, while in England the aid of the courts has been invoked, and with great success, to establish the principle of pecuniary responsibility.

We have never seen any attempt made to explain this curious difference. On the face of the matter, since the general principles of law governing the whole subject are the same in the two countries, we should have anticipated that the two remedies would be developed *pari passu* in the United States and in England; but such has not been the case. Injunctions against strikers have been our way; the English method is to make the unions and their managers responsible agents. But at length American employers are beginning to see certain merits in the common-law principles laid down by the English courts, and we know of no reason why the English decisions should not be followed here, as we understand they have been already in one or two courts.

The development in this country of the common-law remedy has all the more interest for us because it comes at the same time that a determined effort is being made to emasculate that remedy by way of injunction through act of Congress, at least so far as the Federal courts are concerned. It may well be that the proposed act—the object of which is to take away from the Federal courts and Federal suitors the right to an injunction in cases of labor disputes—will either fail of passage or be held unconstitutional; for, although the Supreme Court has generally taken the view that the inferior Federal courts derive their powers entirely from Congress, it is altogether another question whether Congress can discriminate between one class of suitors and another, and prohibit injunctions in cases affecting labor unions while allowing them in all other cases. But, however this may be, the proposed legislation applies only to the Federal courts, and the right to injunctions against threatened invasions of property is one clearly recognized in the State courts.

But if the remedy by injunction is to be taken away or weakened, it becomes all the more important that the common-law remedy, as applied in England, should be recognized here. We have managed the matter hitherto with the aid of sheriffs and police and troops, reinforced by injunctions, pretty badly—that is, with an immense amount of rioting and loss of life and destruction of property. In England they have managed it much better without general recourse to injunctions, but with the aid of the knowledge of the labor leaders that lawlessness on the part of the union would have to be paid for in money. It is dangerous to argue from one country to the other, but of one thing we may be very sure, that, until the law measures out the same responsibility for the labor agitator as that to which it holds every other citizen, there will be no peace. The day is long gone by when the courts tried to inter-

fere with strikes as such. The danger which threatens us is that the labor unions aim at an absolute despotism over their members, combined with irresponsibility. If they could attain their ideal it would give them a complete *imperium in imperio*, in which the sympathy of the mob should exempt them from pursuit by the militia or police, the amiability of the Legislature shield them from injunctions, and all pecuniary penalty should be avoided by remaining unincorporated. They would then dictate the terms on which all labor should be employed, and would fail of complete success only because, in the process, they would have driven capital to find refuge in some other quarter of the globe where there was still equality before the law.

TINKERING THE CAPITOL.

The best architect of his time, Charles Bulfinch, built the Capitol at Washington. Another accomplished architect, Thomas U. Walter, added the great dome. If the House of Representatives has its way, an obscure clerk, with no architectural training of any sort to his credit, and with numerous architectural indiscretions to his discredit, will be allowed to tinker as he pleases the work of Bulfinch and Walter. On Tuesday week, without dissent, the House added to the Sundry Civil Service bill an appropriation of $500,000, being the first instalment of $2,500,000 to be spent on an east extension to the Capitol under the direction of Elliot Woods, Superintendent of the Capitol Building and Grounds. The plan of enlarging the Capitol is an excellent one; but Mr. Woods is not the man to carry it out satisfactorily.

Mr. Woods owes his present title and position to a Congressional subterfuge. He was the chief clerk of the late architect of the Capitol, Mr. Clarke, in which business capacity he served well and won the personal interest of many Senators and Representatives, notably of Mr. Cannon. On Mr. Clarke's death the office of Architect of the Capitol was abolished, and the layman Elliot Woods was smuggled in as Superintendent of the Capitol Building and Grounds. Evidently, he has mastered the art of pleasing, if not of architectural design, for he is now in charge of the Congressional office building, which is to cost $3,000,000. That appropriation was a colossal blunder, but for Mr. Woods to rebuild the front of the old Capitol is a piece of colossal impudence of which only a wholly untrained man could be capable. Indeed, he has tried to mask the enormity of his intentions by professing to carry out the plans of Thomas U. Walter. Now, these alleged plans are, first of all, obsolete, and, next, they are merely sketches or hints which only a trained architect could successfully interpret. The Senator or Congressman who imagines that Mr. Woods can carry out Mr. Walter's scheme as Mr. Walter saw it in his fancy, would be capable of giving a Michelangelo sketch to a sign-painter to execute. The mere suggestion of employing on the Capitol anything short of the best talent in the land is a deplorable index of ignorance in Congress.

For the carrying out of the eastern extension of the Capitol is a problem of great difficulty. Architecturally, it has been necessary ever since Mr. Walter carried the new dome out over the eastern colonnade, with the result that the lantern of the dome is actually wider than the supporting building. Mr. Walter's plan was to build out the east front under and beyond the overhanging lantern, and incidentally to provide additional office accommodations. That need is now pressing, so that artistic and practical considerations combine to urge the prompt execution of the plan. But it is a task of great delicacy. It would be easy to deface the whole eastern aspect of the Capitol irretrievably; and even if the work were respectable in detail, small sins against proportion would inevitably cheapen our most impressive monumental structure. In Mr. Woods's hands the extension would mean vulgarization. His ill-advised efforts in Statuary Hall and the Supreme Court Room have already given only too lamentably the measure of his taste. To set him at tinkering the east front would be disastrous.

Why, it may be asked, did the early Congresses employ Bulfinch, and the civil-war Congresses Walter, but later ones Woods? What curious history of deterioration of taste and knowledge lies behind this antithesis? To answer these questions would be to write a history of American civilization. It is better to strike at the two chief fallacies that obscure the Congressional intelligence in architectural matters, namely, personal favoritism and economy. We waive the question whether or not Mr. Woods is amiable, and pass to the fallacy of economy. On various occasions architects have been roundly berated in Congress for charging the customary 5 per cent. commission. This charge has been characterized as extortionate; even Senator Lodge has declared that it ought to be cut in two. It seems to carry no weight with Congress that business men and corporations pay this fee without question. Right in Washington the Pennsylvania Railroad is paying it on a new monumental station, while grave Senators are vehemently protesting that splendid buildings may be put up without the intervention of an architect, and, of course, without the remuneration of any of the suspected craft. It is difficult to treat this folly and ignorance with any patience. That it actually costs a conscientious architect 3 per cent. on the cost to plan and supervise a monumental building is perfectly demonstrable. That the 2 per cent. actual profit in the transaction is more than saved to the client could be readily shown. For only the architect stands between him and imperfect—hence costly—plans, needless alterations, and inferior materials.

If the Senate and House imagine that there is any economy in paying Mr. Woods's salary and expenses in lieu of the usual architect's commission, they greatly deceive themselves. Cheap plans are usually the dearest for any building, and in a monumental edifice the possibilities of sheer waste through ignorance are enormous. Mr. Woods has already frittered away a round million dollars on internal alterations of the Capitol which are largely impairments. Congress should wait until he has shown his quality on the great office building before it begins to save money by letting him try his hand on the Capitol.

Apparently, the clause directing that the Capitol be extended by unskilled labor was slipped into the Sundry Civil Service bill without any realization of its meaning. It remains for the Senate to repair this negligence of the House. Fortunately, there are a few Senators who respect the historic associations of the Capitol, and have learned that even in the designing of buildings talent and experience are better than audacity and ignorance. All cultivated people throughout the land count upon this remnant in the Senate to save from disfigurement the noble building left us by the enlightened employers of Bulfinch and Walter.

TEACHING THE TIBETANS.

Lord Rosebery, commenting in the Lords on the Tibetan expedition, declared that it was all about a taste in tea. The followers of the Lama liked Chinese tea; they must be taught to like Indian tea; hence Col. Younghusband's diplomatic mission with a brigade. Joking aside, Lord Rosebery's sally gives at least a part of the reasons for the shambles at Guru. The whole story of the expedition is so instructive a chapter in the embarrassments of empire that it deserves briefly to be reviewed.

Tibet is a dependency of China, and signatory of treaties with England under which the English have hoped to enjoy certain trade privileges. These Tibet has been slow to grant, remaining true to her instinct of isolation. Col. Younghusband's expedition had the unprecedented duty of compelling a foreign Power to resume and perfect these old trade negotiations. Note that this was not in any proper sense a punitive expedition. No outrage was alleged; there was no more or better reason for an expedition in the winter of 1903

than there had been every year since the treaty of 1893. It was professedly a friendly effort to lead the Tibetan horse to the diplomatic water and make him drink. Of course, the bugbear of Russian ascendency at Lhasa and the imminence of the war in the Far East helped to hurry up Col. Younghusband.

To pundits in international law we submit the status of a formidable military body which enters foreign territory for the amicable purpose of expediting negotiations. Apparently, it may be regarded as a hostile army or a swollen diplomatic escort, according to the temper of the invaded people. As Col. Younghusband moved into the Dalai Lama's kingdom he had the chagrin to be ignored in either capacity. Nobody opposed and nobody treated with him. After a fruitless wait of some months at Khamba-Jong, hardly beyond the Indian border, the expedition was reinforced and proceeded toward Lhasa.

At last they met a Tibetan general "with a quaint retinue," and perhaps two regiments of troops who held a wall across the highroad. Col. Younghusband doubtless exchanged the usual compliments with the native commander, and expressed the purpose of his mission, namely, negotiation. The general from Lhasa was willing to negotiate, but requested Col. Younghusband first to retire to Yatung. The request was in itself reasonable, for Yatung is the furthest town in Southern Tibet that is open to foreigners. Probably the demand of retirement was hardly an ultimatum. Col. Younghusband was not likely to retrace his steps over the frightful passes he had just conquered. Very likely if Col. Younghusband had simply held his ground and demanded that the negotiations begin at Guru, he might have carried his point. But all this is mere speculation, for suddenly there happened one of those sickening tragedies which seem inevitable when a stronger force deals with a despised race.

Col. Macdonald, driven by what necessity does not appear, conceived the unhappy idea of dispersing the Tibetans "without the use of arms," and apparently hoped to capture the general and his force without striking a blow. Mind you, these Mongols were in their own land, guarding their own road, and in peril of capture by strangers. They were simple folk, and knew nothing about the ulterior designs of the British Empire upon their territory. Of course, they resisted, till, caught between their own wall and the British machine guns, they lay dead in heaps around their leader. It is no sentimentalism that cries out upon such a blood-letting. We know that advancing the boundaries of civilization is stern work, and that the blood of native martyrs is the seed of new spheres of influence. The Tibetans deserve commiseration above our Indians or Filipinos only because their offence was purely commercial. They do not take scalps nor run amuck, there is no pressure of pioneers over the ridges of the Himalayas, England has not bought the roof of the world with a price. In short, all the usual palliations of the slaughter of weak folk by strong fail in this case. These people have been slain for an hypothesis, massacred to maintain a commercial forecast. That Indian tea may go north, that Russia may not slip south, this general with his quaint retinue and his half-armed soldiers is shot down. The generous features of war are wholly absent; all is as sordid as the terrorizing of a tribe for gold in the Congo rubber forests.

The chances are now for war and forgetting of the tortuous stages by which the conflict was brought about; for setting the matter down to the inevitable costs of empire. But anybody who considers the transaction in the light of morals will find that in this matter the British are condemned for utter hypocrisy. To send a brigade into a foreign country is war. War, then, it should have been; or else a longer patience for the sake of peace. If the British wanted Tibet for trade reasons, or strategic, they had abundant precedent for marching in and taking it. What damns the Younghusband expedition is that it was solemnly organized in the name of the peace of the world and the betterment of relations between the Emperor of India and the Lama.

It is a sardonic coincidence that just as England is slaughtering some thousands of Chinese subjects in Tibet, Sir Robert Hart should be presenting his plan for the reorganization of the Chinese army. To reconcile these two events will sorely tax the much-abused "Oriental imagination." For, in a sense, the rehabilitation of the Chinese army would be a step towards avenging the wanton slaying at Guru. Here we strike the essential viciousness of the Younghusband expedition. It was and is a very probable way of embroiling England with China. The British Government would never have dreamed of sending an expeditionary force to Eastern China, but, yielding to Colonial pressure, it has invaded the Western plateau on the theory that the Tibetans needed only to be sufficiently bluffed. Now the Government has learned at some cost that people will fight when their land is invaded and they themselves subjected to personal indignities. If no larger complication arises from the tragedy of Guru, it will be due to the prostrate condition of China, and no thanks to Mr. Balfour's bungling diplomacy. Meanwhile, the Chinese reformers, who observe foreign politics with a keen eye, must gain some amusement from the attempt of England to arm China against Russia in the East, while an armed expedition, "the diplomatic character of which remains unaltered," we are assured, is shattering Chinese domination in the West.

OF PORTRAITURE.

All the arts employed in portraiture break down somewhere. Who can put his finger infallibly upon the true bust of Cæsar? Is the Stratford bust or the Droeshout print more like Shakspere, or is neither a veracious presentment? Shall Houdon, Peale, or Stuart fix for us the lineaments of Washington? May we rest in Carpenter's oil painting of Lincoln, or in Marshall's engraving, or in Saint Gaudens's Chicago statue? But with Lincoln we are already in the age of the daguerreotype and the photograph. Yet this only increases our perplexity, so numerous and diverse are the camera's reports. Bad posing and focussing distort and vulgarize; and then the man himself, sun-pictured at various ages, undergoes great changes of expression, takes on new lines of care and responsibility and sadness, from beardless becomes bearded. In the end, everybody forms a sort of composite image of the great statesman, and selects whatever print or photograph comes nearest to this abstraction.

Photography from life does, indeed, enable us to form unerring inferences about the subject's appearance, at least in a general way—the fashion of the hair, for one thing, the size and shape of nose, mouth, and ears, the space between the eyes, the character of the brows; yet each liable to correction for untrue planes, points out of focus, and the maladroitness or trick of the printing. Retouching, Rembrandtesque lighting, conceal features essential to be known, or falsify the complexion. Deliberate flattery is the fortune of many a photographer; but with the best intention to be honest, he may and perhaps must fall short quite as often as he produces something authentic. In a rather extended comparison of photographs submitted by candidates for teachers in our public schools, when (we are speaking of women) there is every motive for heightening personal attractiveness, we have found the original usually better than her effigy. In fact, as was said by an old sea-captain of "fast sailers," to get ahead the camera needs "a great deal of assistance."

Perhaps that age is most fortunate when *one* artistic memorial finds universal acceptance with contemporaries, and determines the conception of posterity. Still, being one, it must needs be popularized, and then begins the divagation that lends so much instructiveness, through grave copying of copies, to a collection of portraits of any historical personage. His admirers who buy for their walls are influenced partly by their ideal, partly by the art of the reproduction, content to have, if not the real hero, a worthy tribute of genius in whatever form, graphic or glyptic.

Let us suppose that such a collector or admirer wishes to procure the genuine Jean Jacques Rousseau. Perplexed by the multitude of representations — full-face and profile; bonneted, peruked, and bare-headed—divisible under some half-dozen types, he seeks a clew to the labyrinth. To sum up, he finds the death-mask made by Houdon, who used it for numerous busts; the pastel portrait made from life in 1753, by Maurice Quentin de la

Tour—the original now preserved in the Musée de Saint-Quentin; the replica from the same hand, made in 1764 and now in the Musée Rath at Geneva; the oil painting made by Allan Ramsay in London in 1766, now in the National Gallery in Edinburgh. The wax *modèle* in relief made by Isaac Grosset the elder at the same date—who knows what has become of it? It is not included in the list of this artist's works given in the 'Dictionary of National Biography.' These are the sole authoritative standards.

Confining ourselves to the two paintings, we remark that Ramsay's portrait begot grander and finer engravings than La Tour's. His own country was not unmindful of the prophet, but Rousseau was a veritable lion in England; and whereas La Tour's work was a labor of love, Ramsay painted by order of David Hume, and the two engravings then and there made after him, by David Martin and by Richard Purcell (alias "C. Corbutt")—the latter reversed—are superb folio mezzotints. Comparable in scale, if somewhat coarse in execution, is J. B. Nochez's line engraving after Martin, published in Paris in 1769. In the case of La Tour, the first engraving appears to be L. J. Cathelin's (1763), bearing no name, but only Rousseau's device, *Vitam impendere vero*, in accordance with his authorization of July 21, 1762, to the Maréchale de Luxembourg, then the owner of the pastel of 1753. (The fine engraving by Augustin de Saint-Aubin from the same portrait is reversed.) So far so good, and now we may choose between the La Tour in French fashionable costume and Ramsay in Armenian bonnet and fur-bordered cloak. Which is the real Rousseau? Either, one might respond; in spite of a difference so great that they never would be suspected to stand for the same man—for they were taken thirteen years apart, or between the time when the Citizen of Geneva was delighting the Court with his opera, "Le Devin du Village," and the time when, having renounced that citizenship upon the public burning of his 'Émile' in his native place as well as in Paris, he began his long wanderings, haunted by the monomania of a universal conspiracy against him.

A man's opinion of his own portrait is proverbially discredited. In this case we cannot tolerate "Rousseau juge de Jean-Jacques" as in his famous Dialogues. He had a pronounced predilection for La Tour's portrait of him. It has, in fact, a smiling expression, not "touching," as Bernardin de Saint-Pierre found it, yet with the "je ne sais quoi d'aimable, de fin." Diderot, who viewed it in the Salon of 1753, thought La Tour (a wonderful technician, in his opinion) to have made rather a pretty thing than a masterpiece; and criticised the dress of the courtier, that masked the author of the Discourse on Inequality, and even the comfortable rush-bottomed chair he was seated in—clearly not the man implied in Marmontel's lines affixed to the pastel—

"Sages, arrêtez-vous; gens du monde, passez."

Ramsay's canvas, to our eyes, conveys far more strikingly the personal charm and the lively intellect of Jean-Jacques. It shows also those "regards perçants et inquiets," that "œil oblique," of the self-tormentor, which Dusaulx noticed in their first interview three years later. Rousseau sitting for it (or standing in a constrained attitude, if we may believe his subsequent account) found no fault with it. He speaks, in his letter to Du Peyrou of March 29, 1766, of the "good painter," whose work the King had asked to see, and which was so much approved that it was to be engraved. Later, upon his breach with Hume, the portrait seemed a part of the foul conspiracy by which he had been brought to England, and he denounced it (but apparently upon the engravings) as an attempt to make a sullen and frightful Cyclops of him.

Was Hume disappointed? The first night out from Paris, it will be remembered, the poor Frenchman, sleeping in the same room with his patron, heard him cry out with the ominous words, "Je tiens J.-J. Rousseau!" Had he really "got" him, with Ramsay's aid? We shall never know how good the likeness is. The National Gallery of Scotland has "got" it, and our collector must put up with an engraving. Martin's he cannot fail to envy for its art, but if he compares it minutely with a photograph direct from Ramsay, he will discover fatal aberrations, the parent of countless others in the long line of repetitions. Not without reason did Rousseau censure it for the eyes, which, if not Cyclopic, are larger and more open, are lighter, and have none of the rather beady expression of the painting. This change carries the eyebrows and forehead higher, affects the width of the head, alters the angular curve of the Armenian bonnet, thickens the upper lip of the wonderfully sensitive mouth, and in other ways departs from the model. Yet no expense was spared to command the best talent for this copy.

Photography, which enables us to make this damaging comparison, also paves the way for a nearer approach to a trustworthy engraving. The defects we have noticed may have been those of the draughtsman combined with the engraver's. It is now possible to photograph upon the wood-block, and to have the base as true as the camera can make it. This has actually been done within the past few weeks by the indefatigable Gustav Kruell, and we are prepared to say that here and now for the first time in any country has Ramsay's portrait been engraved in a manner to inspire confidence, as well as in the highest style of art. It comes in good time, for in 1912 the world will be celebrating the 200th anniversary of the birth of Rousseau.

FROM WATERLOO TO ST. HELENA—II.

PARIS, March 23, 1904.

We left Napoleon at Rambouillet. He spent the night there, being slightly indisposed, and started thence on the 30th of June. At Tours he had a brief interview with M. de Miramon, formerly one of his chamberlains. He passed through Poitiers and Saint-Maixent unrecognized, and reached Niort in the evening of the 1st of July. He stopped there at a small inn in the faubourg. Being recognized, crowds gathered at the cry of "Vive l'Empereur!" At Niort he received a letter from the Maritime Prefect of Rochefort, Capt. Bonnefous, who said that an English squadron was blockading the port. It seemed extremely dangerous to him to attempt to force a passage. The squadron, under the command of Admiral Hotham, consisted of three men-of-war, two frigates, and a division of small ships, but it was spread over a very great distance, from the point of Quiberon to the mouth of the Gironde. There was in reality before Rochefort but one big ship, the *Bellerophon*, and two small ones. Bonnefous's letter greatly annoyed Napoleon, who was only partially consoled by the popular ovations. In accordance with his instructions, Gen. Beker wrote a new and pressing letter to the Executive Committee in Paris; but Napoleon already saw no other way out of his difculties than to place himself in the hands of the English. Many offers were made to him by the officers of the garrisons; he knew, however, that large armies were marching on Paris. He left Niort, after giving a napoleon to each soldier of the Second Hussars Regiment, and started for Rochefort. In every village which he passed through, he was cheered and received with acclamations.

Within a few days, the Maritime Prefect of Rochefort had received orders to arm two frigates, the *Saale* and the *Méduse*, to embark Napoleon and his followers for the United States. The frigates were to leave port immediately after Napoleon's arrival, provided that "the enemy were unable to oppose their departure." All was ready when, on the morning of the 3d of July, the Emperor arrived. He was anxious to start at once, but Bonnefous said that the winds were not favorable. Napoleon presided over a sort of council of war, to which he summoned Vice-Admiral Martin, who lived near Rochefort. The council decided that it would be impossible for the French frigate to escape the vigilance of the English ships. Admiral Martin advised the Emperor to go on horseback or in a small boat to Royan, at the mouth of the Gironde, where was the corvette the *Bayadère*, Capt. Baudin. "I know Baudin," said he; "he is the only man capable of conducting the Emperor safely to America." The proposition was accepted, and Bonnefous sent a courier to Baudin. Baudin answered the next day:

"The Emperor can confide in me. I was opposed on principle to his attempt to reascend the throne, as I considered it fatal to France, and events have justified only too well my previsions. To-day, there is nothing that I am not disposed to undertake to spare my country the humiliation of seeing its sovereign fall into the hands of our most implacable enemy. My father died of joy when he heard of the return from Egypt of Gen. Bonaparte. I should die of grief on seeing the Emperor leave France if I thought that, by remaining, he might still do something for her. But he must leave only to live an honored life in a free country, not to die a prisoner of his enemies."

Baudin offered to conduct Napoleon to America either in one of his ships, the *Bayadère* or the *Infatigable*, or on board the *Pike*, a very swift American ship, which he would convoy. "In case of an encounter, I would devote myself with my corvettes, and, however superior the enemy might be, I should be sure to check him." Napoleon, unfortunately for himself, temporized. He still had some hope of receiving English passports; he had not quite abandoned the hope of a military, of a popular, rising. If all was lost, he meditated giving himself up to England. No news came, the wind continued to be unfavorable, the English squadron was still in

sight. Many of the Emperor's followers arrived. Napoleon received a visit from his brother Joseph, who offered to start with him. The inhabitants of Rochefort made constant demonstrations of loyalty to the Emperor.

On the 8th of July Beker received a letter from the Provisional Government in Paris. Fouché sent this order: "Napoleon must embark without delay. . . . You don't know how much the surety of the State is compromised by his hesitation. You must in consequence employ all forcible means while endeavoring to show the respect due to Napoleon. He must make no further offer of his services; our duties to France and our engagements with the Powers forbid us to accept them." Beker, on receipt of this communication, pressed the Emperor to come to a decision. Napoleon told him to prepare transportation for himself and suite to the island of Aix, not far from the place where the two French frigates were waiting. He left Rochefort and took the road to La Rochelle. At Fouras the transports were in readiness. The shore was covered with sailors and women, who screamed "Vive l'Empereur!" Once on the sea, which was very stormy, Napoleon ordered that the transports should take him directly to the frigates. He was received with military honors on board the *Saale*. The next day, the weather being better, he made a long visit to the island of Aix, reviewed, though he was in civilian clothes, a regiment of marines which had been very recently formed, inspected the fortifications, and talked with the officers, as if he were still the head of the army. Returning on board the *Saale*, he found a fresh dispatch from the Provisional Government, which gave Gen. Beker precise instruction, namely, that a ship should be placed at the Emperor's disposal, but that on no account, once departed, could he land again on French territory.

Napoleon decided to send Rovigo and Las Cases to the commander of the English squadron. The commander of the *Bellerophon*, Captain Maitland, received them with great courtesy. He was ignorant of recent events, except the result of the battle of Waterloo; he had heard nothing about the passports which Napoleon asked for, but would refer the subject to his chief, Admiral Hotham, who was stationed at Quiberon. Meanwhile he should be obliged to attack the French frigates if they left the port, to visit all neutral and merchant ships, and, if Napoleon was found aboard, to keep him prisoner pending the decision of the admiral. At the close of a conversation which took place during breakfast on board the *Bellerophon*, Maitland suddenly said, "But why should not Napoleon ask for an asylum in England?" The French plenipotentiaries, who expected this suggestion, answered that England was very near France, and its climate would not suit Napoleon.

The negative result of the interview with Maitland alarmed the officers and sailors of the French frigates. The captain of the *Méduse* offered to make a night attack on the *Bellerophon*, and to sacrifice his ship in order that the *Saale*, with Napoleon on board, might make its escape. This heroic proposition of Captain Ponée touched the Emperor, but he thought he no longer had a right to accept it, as he had ceased to be Emperor. He was advised soon afterwards that Captain Philibert, in command of the whole French squadron, had received orders not to expose his ships to any danger. Thus cut off from counting on the frigates, he fell back on the idea of delivering himself up to the English. He left the *Saale* and landed in a boat on the island of Aix, with Gourgaud, Bertrand, and Beker. His suite followed him. The captain of the *Méduse*, Ponée, exclaimed: "What a pity he did not come on my ship! I would have forced the blockade. . . . He does not know the English! Poor Napoleon, you are lost!" The officers of the regiment of marines in the island of Aix made plans for Napoleon's escape; but, since he had left the Malmaison, he had never seen but three ways open to him worthy of his character—to take boldly again the command of the army; to embark on the French frigates with regular passports and go to America; or to give himself up to England. After some hesitation—some preparations even for an escape on a Danish merchant ship which was waiting in the Gironde—Napoleon took his final resolution and sent Las Cases to Captain Maitland of the *Bellerophon*. Maitland did not know the ulterior designs of his Government, but he gave the French plenipotentiaries to understand that Napoleon would find in England a suitable reception. "Even if," he said, "the ministers had a different will, public opinion, powerful in our country, would force them to act according to the generous sentiments of the English nation." General Lallemand accompanied Las Cases. His participation in the military events which had followed the return from Elba led him to ask if Napoleon ran the risk of being delivered to the Government of the Bourbons. "Certainly not," said Maitland. The English captain said more than he had a right to say, and the account of his assurances partly induced Napoleon to write his famous letter to the Prince Regent:

"Your Royal Highness, exposed to the factions which divide my country and to the enmity of the greatest Powers in Europe, I have put an end to my political career, and come, like Themistocles, to sit at the hearth of the British people. I place myself under the protection of its laws, which I claim from your Royal Highness as from the most powerful, the most constant, and the most generous of my enemies."

The Emperor confided this letter to Gourgaud, by whom he wished it to be placed in the hands of the Prince Regent. Gourgaud returned for the third time to the *Bellerophon*. Meanwhile, a messenger from the new Minister of the Navy, Count Jaucourt, had arrived, enjoining the Maritime Prefect Bonnefous to prevent all communication of Napoleon with the English squadron. Napoleon left the island of Aix and went on board the brig *Epervier* on the 15th of July, at sunrise.

"He wore his sword, his little hat, the green coat of colonel of the Chasseurs de la Garde. It was the first time he had put it on since his departure from the Malmaison. The commander of the brig, Lieut. Jourdan de la Passardière, received him. All the sailors were on deck, much moved, with tears in their eyes. Napoleon inspected them, hailed, as during the days of victory, by the cry of 'Vive l'Empereur!' Lieut. Borgnis-Desbordes, sent by the *Saale*, said to Jourdan in a whisper, 'Make haste, for they may come to arrest the Emperor.' 'Not on the *Epervier*,' proudly said Jourdan, 'as long as I live.'"

Beker accompanied the Emperor on the brig, and asked if he ought to go further, as far as the English squadron. Napoleon looked long at him and answered gravely, "No, General Beker; return to the island of Aix. It must not be said that France delivered me to the English."

Correspondence.

PORTO RICAN ASPIRATIONS.

To the Editor of The Nation:

Sir: A paragraph in your issue of February 25, relating to Porto Rican affairs, is likely to mislead those who are unfamiliar with insular politics. In it you speak of a resolution adopted by the "Federal Assembly," calling for statehood or independence. From this the casual reader might infer that the Legislature of the island had taken such action.

Now, the House of Delegates is the only elective body in Porto Rico, and is composed of Federals and Republicans, who represent the two political parties. The House is strongly Republican. During the month of February, and coincident with the session of the House, a group of Federals and their sympathizers met together at the Hotel Olimpo in Santurce, a suburb of San Juan, and passed the resolution to which you refer. A political gathering at the Madison Square Garden or in Carnegie Hall might have an equal significance. There is, therefore, no more reason to suppose that this resolution represents the aspirations of the people at large than there would be for assuming that the United States in 1901 believed in free silver because of the sixteen-to-one plank in the Democratic platform.—Respectfully,

Arthur Hugh Frazier.

Executive Mansion, San Juan, March 28, 1904.

CUBAN ARCHIVES.

To the Editor of The Nation:

Sir: I am indebted to Señor Vidal Morales, Archivist of the Archivo Nacional in the castle of La Fuerza, Havana, for the following information bearing on the possibility of tracing material on the history of Louisiana in Cuba. Prior to 1842 each superintendent of a province had his own archive in his office. The general archive was created by royal decree in 1842. Since its creation it has occupied three buildings in succession. In 1889 there is a record of transfer to Seville, made by royal decree under the archivist in charge, N. Comejo. All the archives remaining in Cuba are now gathered together in the Archivo Nacional.—Yours truly,

William Beer, Librarian.

Howard Memorial Library, New Orleans, March 30, 1904.

IS ITALY DECADENT?

To the Editor of The Nation:

Sir: It is a curious sign of our later lack of enlightenment, this present tendency to deride and underestimate the land to which we owe our literature, our art, our music, our science—in short, our civilization. A specially blatant expression of it appeared in a recent number of the *Bookman*, un-

der the imposing title of "Historical Significance of Decadent Literature," in which that singularly ill-informed writer, Mrs. Gertrude Atherton, declares, not only that Italy is decadent, but is "an old corpse reeking with rottenness, degradation, and disease; a thing of the past; gangrene crying out for decent burial." All of which "hideous facts" she finds "epitomized in the novels of D'Annunzio." As D'Annunzio is adored in Paris and despised in Rome; as his great public is in France, where his works are first published in French, it might seem that decadence would be found in the nation that admired the decadent writer, rather than in the race that rejected him.

The absurdity of laying such stress upon the writings of a single author would make the statement not worth refutation if it were not so striking an illustration of a widely prevalent and utterly false idea concerning a noble nation, to which the modern world has been so deeply indebted for all that makes life worth living. Literature and art have long ago acknowledged their obligation; and the most modern of sciences, electricity, has adopted the names of Italian inventors as words to express the new powers with which it deals. The test of the decadence of a nation is not the work of an individual writer, but the decrease of its fecundity and consequent loss of population. It is not in Italy that you hear of "race-suicide." On the contrary, the growth of the population is so great that the land cannot support it, and, though the excess is spreading out over the world, the number at home is not perceptibly diminished. Had the writer of this mendacious attack on Italy really, as she says, "been born with the faculty to see," she would have recognized valuable qualities in the vast Italian immigration to our shores. She would have noticed their sobriety, industriousness, faithfulness, which have been remarked by careful observers wherever Italian laborers have appeared—by people, too, who had been misled by the prevalent misconception of Italian character, and expected to find their quiet towns invaded by a horde of brigands, but afterward declared that a better and more orderly set of workmen had never appeared in their midst.

To one who has lived for the last decade in Italy and learned to appreciate and admire the Italian character, it is most gratifying to find the stupid prejudice against the race thus disappearing. When one really knows Italy, one knows how to appreciate the simple, healthy, sober family life he sees everywhere about him. The decadent exists in Italy, as in Boston; but the decadent most in evidence in Italy is the degenerate foreigner, the Englishman, the German, the idle American, whom the Italian authorities are arresting and striving to drive out of the country. The leisure class in any country is not the representative of the nation's life; and a race that is three or four times as prolific as the New England Yankee is far from decadence.

Everywhere in Italy the careful observer is struck with the great progress which this young nation has made in its brief existence of less than three decades. In that short period they have become a literate people, and are rapidly becoming an industrial as well as an agricultural community. The Italian cities, from being hotbeds of filth and ignorance and disease, are to-day cleaner and healthier than our own; and, what is more, the streets are safer. Crimes have been committed in the streets of Boston and New York this winter which one never hears of in Rome and Milan; and when we reflect on the ugly disfigurements we allow in our thoroughfares, and the amount we expend in beautifying our cities, comparing our vast means to Italian poverty, we are not prone to accuse the Italian of being behind us in civilization.

Poor as the Italian nation is, and burdened with immense expenses for an army and navy on which its very existence depends, it yet finds $20,000,000 a year for the support of its common schools; and its charities are the most extensive and splendid in the world. I have not space to enumerate the many proofs of life and activity —the factory chimneys everywhere rising, the great increase of commerce, the endless evidences to be seen if one is really "born with the faculty of seeing." If one insists that he has found only rottenness, degradation, and disease, we must remind that prejudiced observer of the remark of the distinguished French lecturer to the discourteous clergyman, who could find nothing but rottenness and filth in the Parisian Sunday: "These things can also be found in New York if you like to wallow in filth." But that fact does not prove that New York is rotten and a decaying corpse.

SALEM, MASS., March 29, 1904.

"THE ABOLITION OF WAR."

TO THE EDITOR OF THE NATION:

SIR: To the readers of the article under the above title (*Nation*, No. 2020) the following passage from Montesquieu may be of interest:

"If great conquests are so difficult, so vain, so dangerous, what can be said of this disease of our century which leads to the maintenance everywhere of an inordinate number of troops? It has its reduplications and necessarily becomes contagious. For as soon as one state increases what it calls its forces, the others suddenly increase theirs, so that nothing is gained thereby except the common ruin. Each monarch maintains all the armies that he could have if the peoples were in danger of being exterminated, and this state of exertion of all against all is called peace. Therefore Europe is so ruined that three civilians in the condition in which are the three most opulent powers of this part of the world would not have anything to live on. We are poor with the wealth and commerce of the whole world. . . . The result of such a condition is the constant increase of taxes; and—what prevents all future remedies —they no longer depend on their revenues, but they carry on war with their capital. It is not unprecedented to see states mortgage their capital even during peace, and employ for their mutual ruin such extraordinary means that the most prodigal young nobleman would hardly be able to invent them for himself" ('Deux Opuscules de Montesquieu,' pp. 40, 41).

Such passages against war are frequent in most of the other French writers of the eighteenth century. Buffon, who often declares against war, says in his introduction to the 'Époques de la Nature': 'Would to Heaven that the names of all these so-called heroes whose crimes or sanguinary glory have been celebrated, were buried in the night of oblivion."

TIMOTHY CLORAN.

NASHVILLE, TENN., April 1, 1904.

PROFESSOR BUTCHER'S LECTURES AT HARVARD.

TO THE EDITOR OF THE NATION:

SIR: Perhaps some of the readers of the *Nation* would like to have their attention called to the course of lectures from Professor Butcher now in progress at Cambridge. This course is the initial one of a lecture foundation established by Gardiner Lane, esq., in memory of his father, the late Professor Lane. Professor Butcher is well known for his distinguished service in classical scholarships. His career began as Fellow and Tutor of Trinity College, Cambridge. From '76 to '82 he was Professor of Greek in University College, Oxford. Since 1882, for more than twenty years, he has been professor of Greek in Edinburgh University, where he succeeded the brilliant but somewhat whimsical John Stuart Blackie. Mr. Butcher recently received a signal mark of honor when Mr. Balfour presided at the banquet which was given him on occasion of his retirement (to the deep regret of all) from his professorship of Greek. Lovers of Homer have long been familiar with Mr. Butcher's translation of the Odyssey, in association with Andrew Lang. Since then have followed: 'Demosthenes,' 1881, 'Aspects of Greek Thought,' 1891, and 'Aristotle's Theory of Poetry and Fine Art,' 1898.

The audience which welcomed Mr. Butcher on Monday was one which it would have been hard to match in any other place in our country. The semicircular audience room of the Fogg Museum was crowded to the doors. Professor Morgan introduced the lecturer in words glowing, but not a whit too warm, and Professor Butcher expressed with deep feeling the gratification which it gave him to stand before an American audience in such a place and with such surroundings. The lecture was a rapid survey of what was most distinctive of the Greek and Hebrew genius.

Mr. Butcher began by a reference to Dodona, with the wild and primitive worship of Zeus. Thence he passed to the oracle of Apollo at Delphi, and showed how Apollo was the prophet of Zeus, and how the mind of the supreme God was declared by gifted priests in measured, wise, and beautiful utterances. He pointed out how Delphi concerned itself in politics, could not maintain its incorruptibility, and how, when it failed politically, Athens took up and completed its work.

The Hebrews, said Professor Butcher, were doomed to sterility. They had no public spirit, no art. Art, in their view, led to idolatry and was accursed. Even the searching for causes, so passionate a quest of the Greek, was vanity to Ecclesiastes. But what poetry they had! Consider the unapproachable beauty of the Psalms, the sublimity of Job, the grandeur of Isaiah. A considerable portion of the lecture consisted of an analysis and comparison of "Promotheus Bound" and the Book of Job. One rarely finds a finer piece of literary criticism than this study, which, we may be sure, will appear in book form.

The lecturer discussed the Greek and the

Hebrew view of history. The story of the Jewish past is the story of the generation of man. History, to the Jew, is the drama in which God himself is the chief actor. Much of what arrests attention in the view of historians of other nations is nothing to the Hebrews, who always look for the underlying spiritual significance of events. Herodotus alone, in his search for the divine providence, approaches them.

One of the most beautiful passages in the lecture was the description of Plato's 'Republic.' Plato does not expect all mankind, or a large part of mankind, to be interested in, or to be elevated by, his discourse. He is in search of a true method of training intellect and character for those who can appreciate and use this method. Greek culture was always a culture for the few. Even their wonderful artistic faculty, we must realize, was not possessed by all.

The Greek was not much inclined to speculate about the future. "Uncertain is the future," said one of his proverbs. But the Hebrew prophets laid hold of the future with invincible trust. The loss of the Hebrew's country seemed to point him to the city which has foundations, whose builder and maker is God. "I do not ask you," said Professor Butcher, "to estimate the value of the contribution of each race, considered by itself alone, to our modern life and thought. Both are indispensable. Each is the supplement of the other."

It is impossible to give any just idea of how filled with fresh thought the lecture was, how stimulating and quickening; and seldom does an audience of the highest cultivation give such proof of appreciation as Professor Butcher's audience gave by their eager attention and enthusiastic, prolonged applause. Not only Cambridge is to be congratulated in securing this brilliant course of lectures, but Columbia and Johns Hopkins, which Professor Butcher visits later.

ROBERT P. KEEP.

FARMINGTON, CONN., April 3, 1904.

MONUMENTA POMPEIANA: ITALIAN ENGLISH.

TO THE EDITOR OF THE NATION:

SIR: The Cornell University Library, and presumably other large book collectors in America, are in process of acquiring a foreign repository of art, some of whose peculiarities seem to merit the attention of your readers. I refer to a serial publication entitled "Monumenta Pompeiana" now coming out, fascicle by fascicle, in Naples, Italy, reproducing in exquisitely colored plates various Pompeian mural decorations, and in cosmopolitan fashion explaining those plates with quadruple parallel texts in Italian, French, German, and English. This work, large portions of which must be of intense interest and delight to professional archæologists, should prove of more than passing interest and pleasure to all lovers of decorative art throughout the cultured world, not only on account of the remarkable excellence and instructiveness of the Pompeian originals here reproduced, but also because of the intrinsic beauty of form and color in the reproductions. Naturally, it is an expensive work. Twenty-four fascicles (71 pages, folio) have already been received at Cornell; some twenty-six are still expected. Since each fascicle is listed at $2.40, and there are to be about fifty fascicles in all, the entire set will cost approximately $120. The purchaser may in reason set his expectations of thorough workmanship fairly high. I have indicated the general opinion held at Ithaca concerning the finish and value of the plates in this collection. What is to be said of the rest of the work, namely, the explanatory text?

The Italian version we may suppose readable enough, and the French and the German we may leave to the scrutiny of such scholars in those tongues as are amused by comparative study of idiom. I should like to direct the notice of your readers, among others, students of our language, to that part of the text which is designed for the special edification of an intelligent public in Great Britain and America; that is, to the grotesque and painful English that offers to interpret these admirable plates for the laity. The following choice exotics are from an anthology of ludicrous excerpts made for my own entertainment and for the diversion of a class in English composition. The first selection consists of two paragraphs accompanying Plate XLIV.:

"The wall reproduced on this plate contains a painting exhibiting Peronas and Micon. It is a subject practised both in mural pictures and in plastic works, also found at Pompei: Peronas feeding with her own milk her old father, Micon, shut in prison and doomed to die of hunger for capital crime. The sad legend reported in fact that young Peronas having requested to visit her father, had been introduced into the prison, after having been submitted to guardian's perquisition, to ascertain whether she brought any food [the Italian corresponding to the preceding sentence reads: "La pietosa legenda infatti narrava che la giovane Perona, avendo chiesto di visitare il padre ed essendo stata perquisita dal custode, se mai recasse alcun cibo, venne introdotta nel carcere"]: and that with her own milk she feeded the extenuated old man ["l'estenuato vecchio"]. After some days, being the prisoner still in life, the guardian surprised of the strange phenomenon, took to himself to spy through the hole of the prison, in order to see what was th er the matter during the daily visit that the young woman paid to the old man. On seeing such a pitiful deed, he reported it to the magistrates, who in homage of so rare a filial devotion, granted grace of life to old Micon, restoring him to liberty.

"That there existed wonderful paintings relative to such a case of filial love, and too, so highly known and admired as to serve for original of reproduction to minor artists, such as pompeian decorators, this is desumed from Valerius Maximum himself (v., 4.), a chief literary source of Peronas' piety."

A second sample of English rich and strange may not encroach too far upon your space. The text in question is supposed to illuminate Plate XLVII., which reproduces a wall-painting representing athletes in the palæstra. I give a fraction of one paragraph:

"In the pavilion to left appears another athlete quite naked, who followed by a *puer* scours (*destringit*) his forehead with the silver strigilis (currycomb) holding in his right hand. As a matter of course, athletes, before fight, were wont to anoint their body with oil in order to draw off their adversary's grasping. Then the floor of the palaestra was spread all over with sand, to avoid that gymnastic men, falling down, should be exposed to lethal consequences. To the oil, with which palaestricus were anointed, and to the sand with which they blotted, add sweat an [un]avoidable consequence of strife and you may easily get an idea of the pitiful state in which said palaestricus left the field of battle. Consequently the imposing necessity of scouring with strigilis, that commonly were bronze ones."

Such is the ridiculous and unpardonable jargon that stammers through a fourth part of this polyglot key to Pompeian mural decoration. Were we dealing with the "explications" of an irresponsible guide-book sold around the entrance of some Continental picture-gallery, we might find less reason for public comment. This series of "Monumenta Pompeiana," however, is another sort of enterprise, and deserves no silent criticism. It is a pretentious and costly work, full of invaluable pictorial matter for the student of history and art. Moreover, it could not be executed without sanction from the Government that maintains so strict surveillance over the ruins at Pompeii. There is no excuse for the gross negligence shown by the anonymous publishers in permitting the editorial matter to appear without revision by a competent English proof-reader.

LANE COOPER.

DEPARTMENT OF ENGLISH, CORNELL UNIVERSITY, March 30, 1904.

Notes.

Whatever the cause, one can but recognize the set of publishing towards a revival of books of travel. A new series is to be begun by A. S. Barnes & Co. with the title "The Trail-Makers: A Library of Great American Explorations," under the consulting editorship of Prof. John B. MacMaster. It will include Lewis and Clark's Journal, the Journey of Coronado from Mexico to Kansas and Nebraska (1540-2), translated and edited with an introduction by George Parker Winship, and many more standard works.

"The Narrative of Captivities" undertaken by Burrows Bros. Co. of Cleveland opens with 'A Short Biography of John Leeth, with an Account of his Life among the Indians,' edited by Reuben Gold Thwaites. It is a thin duodecimo of 70 pages, including the index and the editor's introduction. It follows the first edition of 1831. Leeth was a South Carolinian, born in 1755. His capture by the Delawares at the trading post among them, now the town of Lancaster, O., occurred in 1774, and resulted in his adoption by and long practical identification with that tribe. From fur trader he passed to farmer, and so ended his days in 1831 not far from the scene of his first and only genuine captivity. He was an unlettered man, and the narrative was written out by Ewel Jeffries. There is a facsimile of the title-page of the 1831 edition.

The tireless Mr. Thwaites puts his hand also as editor to the "Early Western Travels, 1748-1845," just launched in Cleveland by the Arthur H. Clark Co. This is a much more stately series of reprints than the foregoing; octavo in size, and typographically very open and handsome, with broad margins. The first volume embraces the Journals of Conrad Weiser (1748), George Croghan (1750-1765), Christian Frederick Post (1758), and Thomas Morris—whose portrait alone is given—(1764). The reprint is reasonably literal, and the pagination of the original publication is indicated throughout; some omissions not involving the main text have been made. An analytical index is reserved for the conclusion of the series. The annotations are abundant and highly valuable. Each piece is preceded by a biographical notice. Morris's

Journal is the only one that possesses any claim to be called literature, and it is a fitting climax to the collection. This British captain was presented by a Miami chief with "a volume of Shakespear's plays; a singular gift from a savage"; and soon after, near the Miamis' fort, when almost the whole village was sallying out to dispatch him, he "had the good fortune to stay in the canoe, reading the tragedy of Anthony and Cleopatra." There will be thirty-one volumes.

The late Thomas Arnold's reprint, 'Dryden: An Essay of Dramatic Poesy [with the Defence of the same],' has been brought to a third edition by his son, William T. Arnold, partly from the father's notes (Oxford: Clarendon Press; New York: H. Frowde). It has a twofold claim to attention—for its theme and in itself as English prose; for general reading as well as for a text-book.

In conjunction with Hodder & Stoughton, London, Dodd, Mead & Co. publish two attractive little volumes, Tennyson's 'In Memoriam,' commented by L. Morel, LL.D., and Borrow's episode of 'Isopel Berners,' edited by Thomas Seccombe, who furnishes an appetizing account of Borrow, followed, in dramatic fashion, by a list of the "Dwellers in the Dingle, and Some Others." A brief summary from 'Lavengro' then ushers in the extract proper.

The fifth edition (1896) of Bartholomew's 'Handy Reference Atlas of the World' (E. P. Dutton & Co.) marked the greatest change from the original edition of 1888, by the insertion of fresh double-page maps, and especially by the utilization of the back of each for smaller maps, adding 50 per cent. to the total. Maps and statistics are now put forth revised to date, and the duodecimo atlas will continue its career of usefulness and convenience known to many. It might have been well to exhibit the union of New York and Brooklyn, though the area of Greater New York is substantially embraced in the special map of this city and its environs. The index is one of the best features of the volume.

Mrs. James T. Fields's 'Charles Dudley Warner,' one of the attractive volumes of the Contemporary Men of Letters Series (McClure, Phillips & Co.), is hardly more than an elaborate sketch of its subject. Without being a record of personal acquaintance, even to the extent that it might profitably have been, it is warmed throughout by a sentiment of intimate appreciation. No one has written more affectingly than Mr. Warner of "being a boy," yet, even with the help of his delightful book, little is made here of his early years in western Massachusetts. A more serious lack is that of any treatment but the slightest of Mr. Warner's editorial work upon the Hartford *Courant*, his source of livelihood. What politics he held, what causes he espoused, how he stood in 1884—all this is silence. There is, to be sure, a letter from an associate on the *Courant*, but it conveys little of the desired information. We are better informed of the steps by which the humorist became a humanist, and the writer of 'My Summer in a Garden' a student of sociological problems, eager for reform. It is significant of Mrs. Fields's method that her emphasis is much heavier on Mr. Warner's interest in the Elmira Reformatory than on his novels, her mention of which is hardly more than casual. A single quotation from Mr. Warner's article in the *North American Review* on the Elmira institution is nineteen pages long. We look for criticism and behold quotations, where we are most directly concerned with Mr. Warner's literary work. Indeed, Mrs. Fields seems frankly to confess her lack of critical efficiency when, in her closing pages, she takes over bodily an Easy Chair paper written by Mr. Howells at the time of Mr. Warner's death. She could not have availed herself of a more just discrimination.

Under the title, 'Teutonic Legends in the Nibelungen Lied and the Nibelungen Ring' (Philadelphia: Lippincott), Prof. W. C. Sawyer of the University of the Pacific has brought together a somewhat motley array of matter pertaining to the saga in question: an essay by Prof. Fritz Schultze of Dresden on some legendary elements in German literature; a translation of Dr. Wägner's prose version of the Nibelungenlied; a synopsis of Richard Wagner's Nibelungen Tetralogy, and, finally, an outline of the Volsunga Saga. While none of these constituent parts of the book contains anything of particular merit or of such a nature as to attract scholars, they combine to make a rather convenient volume for readers who wish to have a general idea of the principal forms which the Nibelungen legend has assumed from the oldest Germanic times to our own day.

It is a curious fact that, while the Welsh and Irish remember their ancient legends and associate them with the landscape, the English or American tourist in England cares mainly for the modern literary associations. It is not the memories or the traces of the Roman occupation that lend a romantic interest to the neighborhood of Rottingdean or Burwash, but the fact that Mr. Kipling till lately lived in one of those villages, and now lives in the other. That is why one meets so many bicycles making the pilgrimage from Brighton. One visits Rye, not because the Danes used to land there in the ninth century, but because it was there that Mr. Henry James wrote 'The Awkward Age.' In his guidebook to 'The Ingoldsby Country' (London: A. & C. Black; New York: Macmillan), Mr. C. G. Harper makes the needful concession to this passion for the modern, and sets out to identify the villages, churches, and manors in Kent that were in any way connected with the "Ingoldsby Legends" or their author. But, though he covers the ground conscientiously, his heart is not so much with the Rev. Richard Barham and his haunts as with Thomas à Becket and the drama that ended with his murder in Canterbury Cathedral at the hands of Fitzurse, one of Barham's ancestors. Canterbury is, of course, the capital of the Ingoldsby country, which runs along the whole north coast of Kent, Barham's county. Mr. Harper's book is the best guide to Kent as a whole that we have seen, and his illustrations are excellent. To read this attractive volume is to acquire a great deal of English history unawares. It is to be hoped, moreover, that it will revive for many readers an interest in the famous "Legends"; they are neglected in these days partly because the fashion in humor has changed, partly because they were meant as a protest, now almost equally out of date, against the Ritualistic innovations of the Oxford school. We are more tolerant now of all forms of superstition, but it may be noted that the Roman Church, more consistent, or with a longer memory, still includes the "Ingoldsby Legends" in her Index Expurgatorius.

'Birds of California,' by Irene Grosvenor Wheelock (Chicago: A. C. McClurg & Co.), is largely a compilation, but a reasonably successful one. The author is heavily indebted to the pioneer manual, 'Handbook of the Birds of the Western United States,' by Florence Merriam Bailey, and to scattered publications by well-known California ornithologists. The illustrations are numerous, though crude, and the text holds the reader's attention, but narrowly misses the commonplace. The book is not wholly free from minor errors in fact. For instance, the author speaks of a bittern, one of the slow-flying birds, as flying swiftly; she calls the flesh of the coot tough and rank; and she appears to confound the bobolink with the sora rail when she says that the bobolink is shot as game under the name of ortolan. She also credits the cuckoo with clipping the hairs from caterpillars on which it feeds, though in reality the hairs are found as a matted lining to the bird's stomach. Such slips incline the ornithologist to somewhat careful scrutiny, but the book will doubtless have considerable influence in popularizing Western ornithology.

'With the Birds in Maine' (Houghton, Mifflin & Co.) is the latest work of Mrs. Olive Thorne Miller. It will entertain people who know little or nothing about birds, and will interest ornithologists who wish to learn of the author's Maine experiences. The songs and the love-making of birds are the principal themes. Here and there Mrs. Miller, like many other successful writers of nature studies, pushes the pen with more profit to herself than to the reader, but the latter part of the book is above such reproach, and the chapters on the chebec and early morning studies show her at her best.

The patriotic spirit awakened in American school children by the observance of national days has led a meeting of schoolteachers in London to advocate the establishment of an "Empire Day" for the purpose of bringing about a closer union between the mother country and its colonies. Its observance will consist of special public exercises in Imperial history, literature, and geography. To further this movement it was urged that the British schools should send to the native schools in Asia and Africa parcels containing compositions, photographs, curiosities, pressed flowers, etc. This suggestion was strongly supported by Dr. William Garnett of the Technical Education Board.

A "revolt against American cotton," according to Consul-General Mason of Berlin, in the Consular Reports for March, is foremost among the economic movements in Europe at the present time. It is shown in the simultaneous effort of Great Britain, France, and Germany to emancipate their textile industries from dependence upon it. In Germany the campaign is more vigorous than in the other countries, largely from the fact that her African colonies are economically disappointing. Among the practical measures proposed to secure a colonial cotton supply are the sending over a number of young Germans to be educated at agricultural schools and on plantations in

Texas, under contract to spend a given number of years as superintendents of plantations in the colonies. A German-American from Texas has already been sent to East Africa to examine the cotton grown experimentally there, and to explore and estimate the area of land in the colony adapted to its cultivation. "Coolie labor from China will be employed in case the native tribes prove too incompetent." Other subjects treated are the German beet sugar industry, the new patent law of Mexico, and alcoholism in France, to the alarming increase of which the French press has been calling attention. There is one saloon to every eighty-three inhabitants, and the annual consumption per capita is 4.81 gallons, as against 1.37 in the United States, and .51 in Canada.

An interesting literary find was recently made in the Royal Library of Munich, where five leaves of an original thirty-six line Gutenberg Bible were found pasted fast to the backs of five different volumes. Two of these leaves, both of which originally came from the Munich Jesuit College, evidently belonged to the same copy of the Bible, containing the thirty-second, thirty-third, thirty-sixth, and thirty-seventh chapters of Isaiah. A third sheet, containing Jeremiah, 7 to 9, manifestly from the same copy, came originally from the Fürstenfeld cloister. The other two sheets are of unknown origin, one containing a part of Hebrews, the other fifteen lines from Ezra.

The committee having in charge the preparations for the eighth International Geographical Congress has sent out a preliminary programme. The Congress is to be held in September of the present year. The general session will convene in the beginning of the month in Washington, and there will be group meetings in New York, Philadelphia, Baltimore, and Chicago, to be followed by final session in conjunction with the World's Congress for the Sciences and Arts in St. Louis. Excursions from St. Louis to Mexico, to points of geographical importance in the West, and to Canada, are also part of the programme.

Dr. August Wolkenhauer, assistant in the Geographical Institute of Göttingen, has prepared for publication the most important German travelling charts from 1478 to 1573, and these will soon make their appearance. The Academy of Sciences in that city furnishes the funds for the publication of this unique collection of new material.

A Roentgen Congress is to meet in Berlin in the Easter week of 1905, the occasion being the tenth anniversary of the discovery of the Roentgen rays. The congress will have as its chairman Professor von Bergmann, of the University of Berlin.

—The Laureate's recent lament as to the repugnance of his countrymen towards the higher forms of poetry in general, and Shakspere in particular, is hardly borne out by the account of play-going in London which John Corbin contributes to the April *Scribner's*. Shakspere has never failed to appeal to the heart of the nation, Mr. Corbin holds, when his plays have been adequately presented; but the actor-managers, "treading perilously between the devil of the luxurious and the deep sea of the poor," rarely give him a fitting presentation. Mr. Corbin is quite hopeful of the results which might follow the establishment of a theatre with sufficient subvention, preferably from private beneficence, to keep the best English plays constantly alive on the boards. Montgomery Schuyler writes in a very commendatory way, on the whole, of the architecture of the St. Louis Exposition. The emphasis put upon the mere determination to surpass all previous efforts comes in for a word of well-deserved criticism. "The superlative degree has seldom been so systematically worked. Every structure is the biggest or the longest or the widest or the tallest ever devoted to a like purpose in the world." The architectural scheme as a whole he regards as noble and impressive, and happy in its adjustment to the one prominent natural feature of the grounds, the ridge skirting the south and east. The idea of this adjustment, however, came too late to be perfect in its execution. Mr. Schuyler's paper is accompanied by six full-page illustrations from drawings by Jules Guérin. Mrs. George Bancroft's letters end with this issue. Her comments on the progress of the Revolution of 1848 furnish their most salient feature. While warmly sympathetic with the revolutionists on the Continent, she yet admired the loyalty of the English to their traditional institutions. Disraeli's opinion, expressed to her personally in conversation, that the renovation of European society on liberal principles was impossible, and that the revolutionary movement meant the dissolution of European civilization, she regarded as "a godless, atheistic and un-Christian doctrine," which he himself could not really believe.

—If a fallacious belief could not outlive successful refutation on the field of logic, the propaganda of Mrs. Eddy would certainly fall before the assault of John W. Churchman in the April *Atlantic*. Mr. Churchman proves at considerable length that Christian Science ignores the canons of history, is false in its philosophy, is a travesty on science, and fundamentally at variance with Christianity. It is safe to say that his argument will meet with ready acceptance at the hands of those who approach such questions from the logical point of view; and it is just as safe to prophesy that the Christian Scientists themselves will have even less trouble in believing his refutation out of existence in their particular sphere than they find in disposing of sin and disease. Col. Higginson's paper this month is devoted to a comparison of the aristocracy of birth with the new aristocracy of the dollar, with results favorable to the coin. The new distinction is based generally on present achievement, not on some accident of the past; it is easier to get into and easier to fall out of, and may pass in the end from an aristocracy of the millionaires to an aristocracy of the millions. Nor does it, he holds, tend to obscure merit apart from money. The apparent worship of the dollar is but the foam on the advancing wave of civilization; a brilliant oration, or a clever magazine article, may in a day bring to some poor young man or woman more real fame than the acquisition of a million can confer. Henry D. Sedgwick considers the effects of our strenuous devotion to material advancement from another, and extremely suggestive, point of view in an article on "The New American Type," based upon the recent exhibition of portraits in the American Art galleries. The physical stability with its consequent mental calm, the peace of body and of mind shown in the portraits of the age of Reynolds, have given way to the shrewd, quick, nervous type illustrated by Zorn's Daniel Lamont, and, in the extreme, by M. Besnard's Senator W. A. Clark—faces showing equipment for dealing vigorously with the immediate present, but no trace of the imagination, logic, intellect, and faith required in the treatment of the remote; "the type of the McKinley era." Theodore T. Munger contributes an extremely interesting and discriminating paper on 'The Scarlet Letter.'

—Louise Morgan Sill furnishes the April *Harper's* with an account of a Buffalo-Duluth voyage on our "Inland Seas." Perhaps one ought not to begrudge her the luxuries of the best inland boats that float, but any one well acquainted with the lakes must concede that a line which condescends to touch but four or five points from Buffalo to the head of Lake Superior, misses many of the most interesting features of the lake region. We do not know who is at fault that President Thwing's papers on "European Universities" are cramped within such narrow limits—just three pages of text for the University of Upsala, with half a dozen illustrations. It is a shame that a really good subject, with a good writer, should be so sacrificed. The desire to present some tidbit for everybody in the menu of a single magazine may possibly be in some danger of resulting in an insufficiency of solid nutriment for anybody. The Easy Chair's delightful reflections on a new version of Luigi Cornaro's treatise on the art of temperate living offer an interesting contrast, in point of view and method, to the recent series of articles in the *Popular Science Monthly*, in which a medical writer gives scientific counsel for maintaining life and strength beyond the usual limit. Mr. Howells is willing to follow the philosophy of Horace—drop out of the game soon enough to avoid becoming a nuisance to those who follow after. Even when Cornaro was congratulating himself upon the sage advice which a century of experience enabled him to give to the Venetians, his competition was probably hindering from a career of usefulness younger men who had their own right to be heard. The reasoning sounds good, but his readers will doubtless excuse Mr. Howells from applying it to himself, however long his own temperate life may leave the Easy Chair at his disposal.

—'The Political Theories of the Ancient World,' by Westel Woodbury Willoughby (Longmans, Green & Co.), is, as the author explains, "the first of a number of volumes" which he hopes in time to publish, "covering the entire history of political philosophy." In Mr. Willoughby's previous publications (his 'Social Justice,' published in 1900, was noticed in these columns) he has outlined his general political theory, and it would be unfair to attempt to criticise this volume except as an introduction to what the author will, if good fortune attend him, make a final work. In criticising 'Social Justice' we interpreted the fundamental theory of Mr. Willoughby to be that of a believer in a sort of a divine right of rulers. This implies paternalism, and in the end leads us to the doctrine of the white

or the Teutonic or the Caucasian Man's Burden, but must not be confounded, apparently, with the divine right of kings, which Mr. Willoughby disavows. In his present preface he refers to the necessity of some underlying philosophy of government in such work as he has undertaken, but the volume itself is devoted to history and analysis. It is divided into two parts, the first relating to Oriental and Greek, the second to Roman, political theories. The author's learning and reading are very wide, and his method painstaking. Of course he goes over ground traversed at all points by many other writers, but as an analytic compendium the work stands by itself and will be found useful. The author suggests that Professor Dunning's 'History of Political Theories,' which appeared when the present volume was still in manuscript, is different in scope, though it covers the same period. Sir Frederick Pollock's 'Introduction to the History of the Science of Politics,' as Mr. Willoughby says, covers the whole history of political philosophy. He notices the fact that there is very little to be met with in English in this field of research. To explain the reason might furnish the subject for a separate essay.

—Mr. Henry Vignaud is continuing his preparation for his long-announced work on the precursors of Columbus by extending his researches into the details of the discoverer's personal career. His second publication in this field is 'A Critical Study of the Various Dates Assigned to the Birth of Christopher Columbus: The Real Date 1451' (London: Henry Stevens, Son & Stiles). This volume is made up of an elaborate summary of the various statements which have been used as bases for the manifold attempts to guess at the exact age of Columbus when he made his most important voyage, of a destructive analysis of the arguments which seem to favor any other date than 1451, and a presentation of the fact which convinces Mr. Vignaud that he is championing the only possible date for Columbus's birth. The opinion most generally current among students is admirably stated by Mr. Vignaud in his next to the last paragraph: "Only two dates can stand against discussion (1446-'47 and 1451). Objections may be made against either, but fewer can be urged against 1451 than against 1446-'47." With this statement probably all who have carefully examined the evidence without preconceptions would agree. Unluckily, Mr. Vignaud, having made his point, goes on to affirm that "if logic has not lost all its rights, the fact that Columbus was born in 1451 is as solidly established as many other events which have become historical, and which no one has ever been bold enough to question." It may be that these other events are merely awaiting some one of Mr. Vignaud's boldness to shatter all their foundations.

—As in his Toscanelli volume, Mr. Vignaud claims too much, and proves his claim too conclusively. He shows so successfully that each statement pointing toward any other date is capable of being variously interpreted, that the reader's mind revolts when he demands that no possible alternative shall be admitted against his translation of a single statement in three words: "major annis decemnovem." If this means that Columbus was nineteen years of age when these words were written, on October 31, 1470, as they very likely do; and if Mr. Vignaud knows all that might be known about legal terminology and the everyday practice of Genoese scriveners in 1470, then Columbus was certainly born in 1451. Mr. Vignaud's researches in legal lore are sufficient to enable him to show that if the statement had read "major annis XVI.," or "XVII.," or "XXV.," no deductions whatsoever could have been drawn regarding the precise age of the person so referred to in a legal document. It may nevertheless be true that, as he has been able to find nothing to prove the contrary, nineteen actually meant nineteen to Genoese lawyers in 1470. As a destructive critic Mr. Vignaud has few superiors, even in the art of self-destruction.

CABINET GOVERNMENT.

Parliamentary England: The Evolution of the Cabinet System. By Edward Jenks. G. P. Putnam's Sons. 1903.

What are the advantages and what are the faults of cabinet government? This is the question forced upon the readers of Mr. Jenks's bright and suggestive 'Parliamentary England.' It is an inquiry to which we propose to give an answer.

Some forty years have passed since Bagehot for the first time brought into view the chief excellence of the cabinet system, which lies in the fact, before his time constantly overlooked, that an English cabinet links together the Executive and the Legislature. It prevents, on the one hand, the occurrence of that discord between the executive and the legislative power which has more than once in our own country weakened the hands of the Federal Government, and has in France been on several occasions the cause of, or the excuse for, a revolutionary crisis. It prevents, on the other hand, the direct participation of the legislative body in the functions of government, and thus averts that form of parliamentary tyranny which, in the seventeenth century, exposed the Long Parliament, till dissolved by Cromwell, to the hatred of the English people; and in the eighteenth century rendered the celebrated Convention detestable to the whole civilized world. The one defect of Bagehot's doctrine is that it is stated in rather too limited a form. The advantage on which he insists is not peculiar to cabinet government; it belongs to every kind of parliamentary executive. The Council which forms the executive of the Swiss Republic is elected for a definite period by the Federal Legislature; it is unlike an English ministry, but it certainly secures the existence of permanent harmony between the executive and the legislative power.

Another merit of the cabinet system, which is also brought into view by Bagehot, is the power of the executive to dissolve the Parliament by which it has been created. This power of dissolution ensures in the long run harmony between the executive, the Legislature, and the nation. No doubt a ministry may keep in power for a short time although, if the opinion of the country could be immediately taken, it would be ejected from office. But, as members of Parliament grow every year more and more sensitive to the opinion of the electors, it is in the highest degree improbable that a ministry could for many years continue in existence if it had ceased to command the support of the majority of the electorate.

An English cabinet has two additional merits upon which Bagehot does not lay any great stress. English ministers are appointed to office, not by election, but by selection. Hence, the risk is avoided, which (to judge by the experience of France and of the United States) is a serious one, that men should be elected to the highest offices in the country not because of special fitness, but because of their not having incurred any special unpopularity. Insignificant mediocrity arouses far less opposition than admitted eminence. Hence, where appointment to office is the result of election, it happens more often than not that the man who is elected as, *e. g.*, President, owes his appointment not to the number of his friends and admirers, but to the fewness of his foes or detractors. No man who studies the modern history of England can doubt that selection has in this case worked better than election. Many dullards and some fools have been cabinet ministers, but, on the whole, the men who have sat in cabinet have usually been some of the ablest party leaders in Parliament. The men who have been prime ministers have usually been statesmen of considerable talent and of strong character. Grey, Melbourne, Peel, Russell, Derby, Palmerston, Disraeli, Gladstone, and Salisbury could not by any sane critic be called politicians of inferior ability. To put the matter broadly, the prizes of parliamentary conflicts have in England fallen to the ablest parliamentary leaders.

The cabinet government, lastly, has been found compatible with the maintenance of an able and independent civil service. This is a point which has to a curious extent escaped attention. A good deal of senseless wonder and of sterile satire has been excited by the circumstance, which is past denial, that the parliamentary heads of the governmental departments have not, as a rule, been experts acquainted with the business which is nominally given into their charge.

> "I stuck to my desk, and I never went to sea,
> So they made me commander of the Queen's Navee,"

are lines which have remained impressed upon the popular memory because they sum up in ridiculous doggerel the actual and apparently grotesque practice of placing at the head of offices where special knowledge is required, politicians who do not pretend to possess this knowledge, or, indeed, to be anything more than Parliamentary leaders endowed with industry and with common sense. The reason why a scheme of selection which appears on the face of it ridiculous answers its ends better than any one would expect, is that a permanent body of trained civil servants supplies the technical knowledge which rarely falls to the lot of parliamentary secretaries or undersecretaries. It is to the high character and the independent position of English civil servants that cabinet government owes half its success.

The defects of cabinet government, though hardly noticed even by so acute a constitutionalist as Bagehot, have become by this time patent. The way in which the cabinet links together the Executive and the Legislature when combined, as it is at the present day, with the dependence of Members of Parliament upon the will

of the electors, makes an English ministry far too sensitive, not to the permanent opinion of the country, but to the transitory sentiments of the electors. An American President, if he is a man endowed at once with boldness and sagacity, may, if he chooses, defy in his executive capacity the sentiment of the moment even though it is reflected in the votes of Congress. Such a course is hardly open to an English premier. He knows that a vote of the House of Commons may at any moment turn him out of office. He learns that his supporters fear that, if a particular step is taken, they will lose their seats at the next election, and he learns that the bye-elections are going against his Government. Our premier may be a person of really high principle—he is quite willing to resign office; but he is not willing to see a policy reversed which he believes to be essential to the prosperity of the country. How can one expect a prime minister under such circumstances to defy popular feeling for the benefit of the nation with the boldness displayed at one or two crises by President Lincoln? It is not in human nature that a man should sacrifice objects of the highest importance when he thinks he can attain them by means of a little truckling on minor topics to popular sentiment or popular folly—by consenting, for instance, to repeal a Vaccination law which, though it protects the country from smallpox, is hateful to a body of energetic faddists, or by saving from the gallows some murderer whose execution might shock the prejudices of an influential class. We may well doubt whether, if some new Dr. Dodd committed a capital crime, an English premier of the twentieth century would venture to hang a clergyman in face of petitions for the villain's life presented by the whole body of Anglican clergy.

Cabinet government, again, as it exists in England, is and must be party government; and the final judgment to be pronounced on the cabinet system will be found to depend on the critic's view, not of political partisanship, which must exist in every free state, but of that artificial and complicated political phenomenon which, under the name of party government, has existed in England for certainly not much more than two centuries. Of the characteristics of this system it is impossible to say anything at the end of an article dealing with another topic; it is well, however, to insist upon the consideration that cabinet government of the English type is bound up with the English party system.

A last quality, which one hardly knows whether to call a defect or a merit of cabinet government, is the extraordinary flexibility of this part of the English Constitution. This is a feature of English Constitutionalism which Mr. Jenks brings well into view. One of the reasons why men well versed both in the law and in the conventions of the Constitution have found an extraordinary difficulty in describing the nature of an English cabinet, is, that cabinet government changes its features from generation to generation—one might almost say from year to year. It was one thing under William the Third; it was another thing under the first two Georges; it underwent a change in the early part of the reign of George III., and assumed a different aspect when, in later years, the second Pitt commanded both the support of the Crown and the support of the nation. The cabinets of Peel again, or of Lord John Russell, differed much in character from the cabinets formed by Mr. Disraeli or Lord Salisbury. At this very moment the relations between Mr. Balfour and the other members of his present cabinet, and between the Cabinet itself and the eminent Unionists who have left it, is full of perplexity and ambiguity; and, behind all the differences which may arise from the character and position of different statesmen, there lies at any rate the possibility—some would say the probability—of a fundamental revolution in the relation of the electors to the ministry. It is, at least, conceivable that at each general election the electors may, as a rule, so clearly express their will that a given statesman shall be premier as to make the English prime minister be, in fact though not in form, as truly an elected head of the State as is the American President. But we here trespass upon the field, not of history, but of speculation, and can with certainty reach nothing but the conclusion that no part of the English Constitution lends itself so easily to fundamental change as does the system of cabinet government.

THE INDUSTRIAL SITUATION IN SOUTH AFRICA.

The Engineer in South Africa: A Review of the Industrial Situation in South Africa after the War, and a Forecast of the Possibilities of the Country. By Stafford Ransome. E. P. Dutton & Co. 1903.

The title of Mr. Ransome's book expresses accurately its contents. The author is a man well known as a mechanical engineer, who has acted as correspondent in many lands for technical and non-technical journals, and who therefore can discuss with the skill of a trained writer the engineering subjects he undertakes to elucidate. That he is a mechanical, and not a metallurgical, engineer is conspicuously evident from the familiar way in which he treats subjects allied to mechanics, and the elementary and diffident manner in which he approaches metallurgical processes and problems. To the lay reader this may be an advantage, for the chapters which he devotes to the treatment of the Kimberley diamond fields and the Transvaal gold mines are sufficiently simple and explicit to be understood by the most unlearned in the mysteries of mining and metallurgy.

Mr. Ransome visited South Africa in 1902 as special correspondent of the *Engineer* (which vies with *Engineering* as the most influential organ of that profession in Great Britain), and the book is an amplified edition of his letters to that periodical. It therefore confines itself to subjects of interest to the engineering and allied trades. But, as South Africa is as dependent for its development on the services of the engineer as is our own West; as even its agricultural resources can be utilized, to any notable extent, only by the aid of artificial irrigation; and as the political conditions are indissolubly associated with the industrial outlook, the scope of the book and its general interest are wider than its technical origin. The author deals with South Africa as no longer a congeries of antagonistic political states, but as an industrial unit, in which the Cape Colony is probably a more serious discordant element than even the extinct Orange Free State and the Transvaal. He describes the harbors of Cape Colony, Natal, and the Portuguese Possessions, and their relations to existing and projected railways. He points out that intercolonial free trade, the total abolition of transit duties, and sweeping reductions in railway charges are now being brought into play, as one of the results of the war. This abolition of artificial barriers must change the old current of commerce, while at the same time cheapening the cost of production and lowering the rates of wages, which are now high because of the extravagant cost of living.

Throughout we are struck by the similarity of conditions in South Africa to those prevailing in sections of our own land, and are reminded actively of the problems which faced us in the Reconstruction period. But while there are striking points of resemblance, there are as striking phases of difference. Over our arid regions there was scattered in small groups a scanty population of red men; this vast tract in Southern Africa, of nearly 2,000 miles from South to North, is inhabited by a comparatively prolific and populous negro race, estimated at five millions, which resisted the advance of civilization as obstinately as our own Indians. One Kaffir war succeeded another; the Zulu war, in which was obliterated a British force at Islandula and occurred the tragic death of the Prince Imperial, the grand-nephew of the great Napoleon, fighting under the British flag; the more recent campaign against Lobengula in Rhodesia, and the existing revolt of the natives in South West Africa against the Germans, are the deplorable, though perhaps the inevitable, forerunners of our selfish civilization, with its iron roads, steel guns, and inexorable commercial requirements. If these be the forerunners, one of the consequences is an urgent demand for labor to work the mines and cultivate the land as it shall be reclaimed from the desert in large tracts by artificial irrigation. The scarcity of labor and the sources from which to draw the necessary supply has become the burning question in the recently conquered territory.

The diamond mines of Kimberley do not seem to feel the scarcity as acutely as the gold mines of the Rand. This may be due, strange to say, to the system which has been forced on the diamond miner of impounding the negro labor. It savors of slavery, yet is apparently popular with the natives. Diamond robbery is of course a profession; but, to minimize the losses, a negro who engages for a given period as a laborer in the diamond mines resigns all liberty of action and is shut up in an enclosure which contains all the elements of a well-provided and well-regulated town. But at the gold mines of the Rand no such precautions are necessary and no such provision is made, and the negro, with his natural improvidence, leaves his work to spend his savings, however small. The high prices paid him by the Commissariat Department during the war, and the generally demoralizing effect of the struggle on his excitable temperament, have combined to discourage him from engaging in steady work at the old standard of wages; and therefore the famous Rand mines, through whose vigor-

ous development the magical revival of prosperity in South Africa was expected to be effected, are not worked up to their capacity, and are not producing within 20 per cent. of their output before the war. Still, despite this drawback, rapid increase of production is being made, for the value of the gold turned out from 6,000,000 tons of ore in 1903 was $62,500,000, as against only $35,000,000 from 3,400,000 tons of ore in 1902. When it is borne in mind that to produce the 18,000,000 tons of pig iron made by us in 1903 there was mined only five times as much ore as the Rand mines turned out, and that the value of the gold bore about the same proportion to the value of the finished product of our steel works, viz., as $60,000,000 is to $300,000,000, we can appreciate the vast importance of that industry to South Africa. And as the mines already opened are capable of greater development, and the gold-bearing rocks are being traced far beyond the limits formerly assigned to them, if progress is to be made, labor in far greater quantities than is or will be available from native sources must be secured. It is estimated that 250,000 low-wage laborers are required now, and that within five years more than twice that number will be called for. The negro, if willing to work, could not supply the demand. Unless the cost of living is sufficiently reduced to allow white wages to fall far below the present standard, the whites can be used only as foremen or skilled workers, or in the proportion of one white man to five laborers; and therefore the only alternative, in the opinion of the majority of the employers, is the introduction of Chinese labor under restrictions. This, as our readers know, has been decided on. The hope entertained is, that ultimately the agricultural possibilities of the country will be realized, and that then the cost of food and clothing will fall, and, the climate not being insalubrious, South Africa will become the home of a large and prosperous English-speaking population; for Oriental contract labor, no matter how well treated and under what restrictions introduced, engenders antagonism in the free white man, and is an incongruous element in our modern industrial system.

Of more interest than even the story of the gold mines is that of the Kimberley diamond fields, which our author tells with clearness and detail. As South Africa has already unearthed 68,000,000 carats of the 83,000,000 of carats which are estimated to have entered the market of the world from earliest times, her diamond mines have acutely influenced the price of that gem; but not to the extent that would have taken place had Cecil Rhoades not intervened to restrict production, by the organization of the De Beers Consolidated Mines Limited, and had not the marvellous growth of wealth and taste for the diamond as the expression of wealth, in this country, made for it a market which it seems almost impossible to glut. Fortunately, the rich, who buy the diamonds, are not the only class of our people who take an interest in the South African diamond fields. Our skilled artisans, as diamond cutters, are rapidly withdrawing that profitable industry from Amsterdam and London, and a modification of the rose brilliant form with twenty facets has even been patented here under the designation of the "Twentieth Century."

Besides gold and diamonds, South Africa has abundance of good coal, which has made it possible to construct across her deserts, in advance of white immigration, more miles of railroad, that infallible harbinger of progress and prosperity, per head of population than even we have built in our own West. South Africa, in fact, surprises us with startling statistical contrasts. The area of the British possessions is 856,000 square miles; the white population is only 898,000, or a little more than one white man to the square mile. And yet the railroad mileage is about 6,000, or one mile of railroad to every 148 white inhabitants, and the exports amount to the large sum of $170 per head of population. As mines and railroads are operated only by machinery, of this our shops should furnish their full share—the more so as our own schools, mines, and mills have sent to South Africa many of the men who have been foremost in developing its mineral resources.

The History of American Music. By Louis C. Elson. Macmillan Co.

Boston has so long been in the habit of considering itself the centre of music in America that on taking up a history of music in this country by a Bostonian one expects, as a matter of course, to find his city treated as the hub, and New York and other towns as mere spokes radiating from it. Mr. Elson, however, is not guilty of such bias. Throughout his book he endeavors to preserve the proper perspective; in his last chapter ("Qualities and Defects of American Music") he thus sums up his tale of two cities:

"Boston has been chronologically the first in the field of oratorio and orchestra, and may still be considered the centre of these schools of music in America. But the city is provincial in the matter of grand opera, and has but little public taste in organ music. In piano recital and chamber music New York and Boston are about equals."

It was in New England that music first assumed a non-European hue. The Englishmen of Virginia had sung their imported songs unchanged, but the less artistic music that was developed in Puritan Boston soon lost some of its foreign qualities and became indigenous to the soil. On this topic of the religious beginnings of American music Mr. Elson has a long chapter (with numerous facsimiles), which is surpassed in interest only by his chapter on Indian and folk music. He notes that some of the Indian tribes were quite unmusical, and while others had many kinds of song, "they resemble each other so greatly in most instances (in musical content) that the mine of folk-music in this direction is far more restricted than the large repertoire would seem to indicate." He concludes that Indian music is not folk-song in the true sense, being too local and too little understood for that, and that it is not a substantial foundation for the native composer to use in classical work. He admits that MacDowell's "Indian Suite" is both important and beautiful, but holds that the actual Indian themes on which it is built do not, of themselves, suggest anything national, and that the composer might have evolved a hundred equally effective original figures, had he wished to. In the plantation music of the South Mr. Elson has more faith as a mine for composers. To the charge that the negro music of the South is African, he replies that it is distinctly a result of American surroundings—of plantation life and camp-meetings, with their improvisational style, strong rhythms, and feverish ecstasy. "Here, then, is the true folk-song of the United States, if it possesses any at all." Stephen Foster, America's chief folk-song composer, attended many negro camp-meetings. After him the spirit of plantation music was utilized in symphonic works by Chadwick and Dvorák.

In his chapter on Instrumental Music and American Orchestras, the author calls attention to the fact that in the seventeenth and eighteenth centuries instrumental music was by no means so common as vocal music, and was heard much oftener in Baltimore, New Orleans, Philadelphia, and New York than anywhere in New England, where there was still a prejudice against it, as being frivolous and allied to immorality. There were no music stores before the nineteenth century. Mr. Elson cites testimony to the effect that in 1828 there was only one oboeist in America, that New York did not possess one till 1839, and that the English horn was a novelty in 1843. But these things would have seemed less strange had he cited an article, written in 1837, in which Berlioz complained that even in Paris there was at that date no bass trombone or contrafagotto. The first use of the conductor's bâton in the United States appears to have been in 1843, and up to 1860 there was more of ambition than of true achievement in the orchestral work of the country. Tributes are paid to Theodore Thomas, "who has done more to raise the standard of music in America than any other man"; to Anton Seidl, who did for the opera what Thomas had done for the concert hall, while at the same time bringing the New York Philharmonic Society to its highest point of efficiency and prosperity; and to the many other men prominent in the annals of music.

It will be observed from the foregoing remarks that the scope of Mr. Elson's book is broader than its title indicates, for it deals with music in America as well as with American music. This enabled him to make a much more interesting book than if he had confined himself solely to the composers and their works. His method of disposing of these composers is ingenious. Chapter eight is devoted to five "American Tone Masters"—Paine, Chadwick, MacDowell, Horatio Parker, and Arthur Foote. This is followed by chapters respectively on the men who have most distinguished themselves in orchestral, operatic, song, and pianoforte composition. The plan has only this disadvantage, that a reader who opens the book for facts regarding the greatest of American song writers will not find him even mentioned in the chapter on "American Song Composers." However, the index will refer him to the place where MacDowell is discussed from all points of view.

American Women in Music have a chapter to themselves, and the author gallantly gives more than seven pages to Mrs. Beach, who, he thinks, can compare favorably with any woman who has yet entered creative musical art. Allowing for local and national patriotism, there is no harm in thus blowing our own horn. Mr. Elson is habitually inclined to optimism, but he is right

in claiming preëminence for this country in the making of pianos. He also asserts that our public schools give more attention to music than similar institutions in any other country in the world. He makes the sensible suggestion that instead of devoting all the time to concerted singing, the schools should teach the general appreciation of music; the chief desideratum in this country being intelligent audiences of music-lovers. In reference to American musical criticism and authorship, to which a chapter is devoted, Mr. Elson expresses his satisfaction because the sentimentalists have never been in the foreground. He laments the excess of piano playing, and warns against characteristic faults—haste and love of bigness. "If only there were less of striving to create symphonies that no one wishes to play or hear, of operas that show straining and labor in every part, and more of genuine unforced music in the smaller forms! The chief trouble with most of the American composers is an ambition that o'erleaps itself."

However, when all is said and done, he is right in declaring, in his final paragraph, that "much more has been done than the world at large is aware of." His book will be most useful in calling attention to neglected treasures, and in giving a bird's-eye view of a field which is really more interesting than one might think. The author's lucid style and thorough knowledge of his subject count for much, and the publishers have brought out the volume in an *édition de luxe*, specially suited for gifts. There are 25 full-page photogravures, and 102 illustrations in the text.

Discovery and Exploration of the Mississippi Valley. With the original narratives of Marquette, Allouez, Membré, Hennepin, and Anastase Douay. By John Gilmary Shea. Second edition, with a facsimile of the newly discovered map of Marquette, of Marquette's letter, and a steel portrait of La Salle. Albany: Joseph McDonough, 1903. Pp. lxxx., 268.

This small quarto (7x9), the maiden effort of Shea, first in a line of more than fifty publications, if we include his Cramoisy series, was born in 1852, served its generation, and was "quietly inurned." Why does it revisit the glimpses of the moon? The truth is, it was Shea's best production; it has become rare; as a source-book and otherwise it retains a value all its own. Its real theme is the cycle of Marquette and La Salle, with the original narratives describing the primal voyages of both upon our greatest river. Three writers who furnish collateral evidence will be vainly sought among the more than three-score and ten tomes of the "Jesuit Relations." Many who cannot consult that thesaurus would gladly learn the mutual relations of the grand explorers through a non-partisan presentment, and that compacted into a single volume. It has been too much forgotten that each of these pioneers was viewed with distorted eyes by his contemporaries, and most of all by Catholic coreligionists. In our decade it is stoutly maintained that Marquette, the chaplain, now stands in the Washington Rotunda where his chief, Joliet, ought to stand; but in their own day no question as to their comparative merit had arisen. While both were equally praised—by their own party, clerical or political—both were depreciated or set at naught altogether by admirers of La Salle as the preëminent pathfinder. The end and aim of Shea was to secure authentic copies of documents relating to the grand voyage of both pioneers, to translate them so far as he found them only in French, annotate and lay them before his readers. He would thus help them to make up their own minds as jurors or judges. The relations of Radisson and De Soto to the continental river were beyond his scope.

At the date of these primitive explorations New France was agitated by a total-abstinence crusade styled by Shea a "brandy war," in which abstainers and drinkers came to bristle up like cats and dogs against each other at sight. A point in dispute, to this day not fully settled, was whether to permit or to prohibit the sale of ardent spirits to Indians; the Bishop of Canada denounced this traffic, and the Jesuits, of whom Marquette was one, imposed and exacted the threatened penalties to the letter. The result was that total-abstinence Jesuits were largely displaced by secular authorities, especially in the sphere of La Salle, and their places filled by Franciscans, called Recollets, who were known to be more lenient to sellers of cognac among natives. Each order naturally became, in the eyes of the other, a Nazareth out of which no good could come.

Marquette's Mississippi voyage with Joliet was in 1673, and a copy of his Journal and Map, slightly mutilated, was printed in Paris in 1681. A corrected copy of the original French with an English translation; Marquette's last letter which he died before finishing, partly in facsimile; as well as the best life of the journalist ever written—Shea's own labor of love—first appeared in the present volume. Marquette's Jesuit narrative to average readers is a plain tale of truth and its own sufficient witness; but, however just a man first in his own cause seemeth, his neighbor cometh and searcheth him. Franciscans or other anti-Jesuits at once took the field, and many of their charges are printed by Shea in their own words. A typical specimen of their animus or animosity is afforded by Father Douay. This Franciscan had gone with La Salle on his last expedition, witnessed his murder, canoed up the famous and fatal river, and published statements (first printed in English by Shea, p. 80), like the following concerning the Journal of Marquette:

"I had brought with me the printed book of Joliet's pretended discovery, and I had remarked in all my route [up the Mississippi] that there was not a word of truth in it." . . . "It would be easy to show that it was printed only on false memoirs." . . . "It was only twenty or thirty leagues [instead of ten times as far] below the mouth of the Illinois River that Joliet descended in 1673." . . . "It was said [in the Journal] that he went as far as the Akansa, yet the Akansa assured us that they had never seen any Europeans before La Salle" (p. 227).

The Franciscan was not alone in holding that Joliet's party never went any distance below St. Louis. The present reviewer a generation ago was told by Henry Shaw, in St. Louis, maker of the grand garden, that he found such a tradition generally believed there, and not by fur traders only, with whom he had begun to deal in 1820. Shaw himself believed it, though it is unlikely that he had ever read Douay. Slanders die hard. Other Douays must have started the tradition before the first settlement of St. Louis, and the nucleus of the cycle war was a glass of whiskey.

The original text of Shea with every note is facsimiled in the reprint so far as types can consummate or compass the feat, being reverenced as no less sacrosanct than the McKinley tariff in the eyes of beet-sugar apostles. It recalls the watchword ascribed of old to British Tories: Touch not a cobweb of St. Paul's for fear you shake the dome. The obsolete notes are good milestones to mark how fast time moves on. Minneapolitans will not object to one concerning the Falls of St. Anthony: "They are no longer beyond the pale of civilization. There is now at the head of the cataract a village with schools and churches" (p. 116). Manifest mistakes, however, should have been corrected. Shea gloried in being first to show that Nicolet was on Mississippi waters as early as 1639. He would have welcomed Sulte's subsequent ingenious and conclusive proof that he was there five years earlier, in 1634; but his editor suffered 1639 to stand. Few books are so unfinished if not deformed through lack of an index. This work, demanding comparative study for appreciation, has special need of such an opener and intelligencer for dull workers.

Life and Teachings of Abbas Effendi: A Study of the Babis or Beha'is founded by the Persian Bab and by his successors, Beha Ullah and Abbas Effendi. By Myron H. Phelps, with an introduction by E. G. Browne, Professor of Arabic in the University of Cambridge. G. P. Putnam's Sons. 1903. Pp. xivi., 260.

One of the most singular phenomena in the life of the present day is the grasping after new things on the part of the religious-minded. Any preacher or teacher, apparently, may secure a docile and appreciative following, provided he makes a large enough claim and speaks with a voice of sufficient authority. The craving is not essentially for knowledge and light; it is for guidance and assurance. Some slight admixture of philosophical ideas—or terminology—seems sometimes to assist, but the main thing, first and last, is the personality and claim of the new leader. Yet, in singular contradiction to this, is an equally plain attitude on the part of the Christian Church. It, always excepting the Roman communion, is gradually abandoning its supernatural sanctions, yielding its claim of a divine authority, and finding its end in an idea of philanthropy and a system of ethics. The eclipse of faith has become an eclipse of religion; the voice of a personal God calling man to intercourse with Himself is becoming the voice of men crying out for love, mercy, justice towards one another. All this is intelligible enough, in view of present drifts of thought. But the question cannot but rise whether this second phenomenon does not stand in a causal relation to the first; whether those who still retain the religious attitude and craving are not thus driven to satisfy themselves in these strange ways, and to follow religious authority wherever they can find it, and whatever it may be.

Mr. Phelps's present book is a curious instance to the point. Students of the

Muhammadan East have watched the growth of Babism since the Comte de Gobineau first drew attention to the new movement in his 'Religions et Philosophies dans l'Asie Centrale' in 1865. They have traced its development out of the Shaykhi sect of Shi'ism to its formal abandonment of Muhammadanism as all but a stage in revelation, much as Muhammadanism regards Judaism and Christianity as such stages antecedent to itself. They are familiar with its claim to be the last revelation and manifestation of God to men, and with the widening acceptance of that claim in Persia and even elsewhere in the Muhammadan world. But then, many prophets and systems such as this have come and gone before now, and left that world pretty much as it was. These, however, had not passed the limits of Islam. Now Babism breaks the barrier, ceases to be a mere Muhammadan sect, and enters upon a career as a world religion. So the little circle of Orientalists are suddenly surprised to find that a queer religious movement of the obscure East, supposedly known to themselves only, counts its thousands of followers in America—avid of new things, if not the mother of them—and that a member of the New York bar has written a book gravely urging the cause of this sect with his fellows, and finding in it the religion of the future for East and West alike, a veritable revelation and guidance for us all who now are wandering in darkness. So far, we may judge, has the failure of the Christian Church gone, and yet so great is the longing with some at least for a positive religion.

Such is the essential point of interest in Mr. Phelps's book—the light it throws upon an American condition; those who wish to study Babism will, of course, turn to the books upon it by Prof. E. G. Browne. Yet even here are some things not to be found elsewhere. First among them is an eighty-page sketch of the lives of the leaders of the Beha'i wing of Babism, dictated by the sister of Abbas Effendi, the present head. It is not a very pleasant story to read, because it suggests to the Orientalist wholesale suppressions and one-sidedness throughout; but to Mr. Phelps it seems to be a kind of gospel. Further, Mr. Phelps gives chapters on the philosophy, ethics, standards, etc., of Babism, drawn from conversations, through an interpreter, which he had with Abbas Effendi during a month's residence at Acre. These, in spite of their second-hand nature, are most carefully constructed, and are evidently trustworthy at every point. The proof of this Mr. Phelps may hardly care to hear, but it is that they reproduce from page to page the commonplaces of Muslim philosophy and mysticism. Here, then, is little or nothing new except the imposing personalities and devoted characters of the leaders. The system is simple Sufiism combined with the hierarchical and prophetic system of the Isma'ilians—which gave us the Fatimid dynasty, the Assassins, the Druses, and divers other things—and a dash of ideas derived from Christianity and strangely transmogrified. In the last, if anywhere, is the new element, and its startling results (unhinted at here) may be read by the curious in Mr. Browne's 'Year in Persia.' The same writer's introduction to the present book is a sane and illuminating estimate of the whole movement, giving weight where weight is due, and recognizing the common Oriental character of much which seemed to Mr. Phelps so wonderful and new.

The Fat of the Land: The Story of an American Farm. By John Williams Streeter. The Macmillan Co. 1904.

We take it to be a favorable symptom that (in the making of many books) architectural, horticultural, and even agricultural romances are now finding a place. House-building, every one knows, appeals to the imagination; children play at it before they can walk, and Spain is crowded with castles, although they may be "by hopeless fancy feigned" on lands that are for others. *Cras ædificabit qui nunquam ædificavit*, and few of those who have builded, even if they build no more, but dream of what might have been. This delightful compound of fact and fancy, this combination of the necessary and the luxurious, this satisfaction of both body and soul, has too long been left to be treated by prosaic architects. Love-making, labyrinthine as it is, has been, as Mr. Howells complains, thoroughly explored; the most desperate expedients are employed by authors in their vain attempts to make us think they are not telling the same old story. Moreover, love-making, granting it to be the end or final cause of existence, is not the whole of it; people live through it, and live after it for years, not having exhausted all capacity for romance. The spending of these years for those who have wealth and leisure has æsthetic possibilities that are fascinating, and workaday people can enjoy these possibilities in imagination if not in reality.

Of architectural and horticultural romances we need not here speak; but the agricultural romance is comparatively undeveloped. Essays on such themes as 'Ten Acres Enough,' or 'Three Acres and a Cow,' and how a poor man by assiduous companionship with pigs and geese and hens may keep body and soul together, exist in plenty; but the hard reality is too prominent for romance. It is well that there are many who can find poetry within these narrow limits; for whom small doses of nature are efficacious. But the book before us has nothing to do with sordid details; it is written for the country gentleman, or the gentleman farmer, and for those who like to read of the life led by these fortunate people. There are cows and hens and pigs, of course, but they are on the scale of Job's possessions. Single animals are not reckoned; they are turned off in hekatombs. Everything is on a grand scale. There is no lack of land, nor of capital, nor even of labor—although here lies the shadow on the picture. There is a happy family and an abundance of pleasant friends. The city is close at hand, available for recreation or for business, and affording an excellent market. The author, who is the protagonist in the tale, was country-bred. He worked as a day laborer when a lad, and was well prepared to direct laborers when ill health compelled him to give up his profession. He wasted no time. As soon as the sentence was pronounced, he set forth and bought his land. In a year or two he had practically effected his improvements, and after seven years his profits were handsome.

He assures us that he exaggerates nothing, and we see no reason to disbelieve him. Given a man who has always loved farming, who has sixty or a hundred thousand dollars that he can lose without serious embarrassment, and who has a head for business, and why should he not prosper? Millions of farmers who are both poor and incapable make a living; myriads if not millions more, having some money and wit, grow rich. The lesson of this book—for it is in a broad way a practical book—is that a rich man may live like a lord on his acres, and may at the same time make his acres support him. As Bagehot used to say, business is more amusing than pleasure, and to carry on a farm as one would carry on a factory is to combine poetry with profit. No occupation is more healthful; in no way can children be given a better start in life. Even without a love for nature and for outdoor life, a man might succeed at farming, just as a man might be a banker while hating the confinement of an office.

As to the actual practice of the art, it is not to be learned from this book. We see the general plan and hear the general results, but the thousand details which have to be considered in business are scarcely mentioned here. Nevertheless, the book is in the main so sensible, so clear, so businesslike, and even so impressive, as to make it not improbable that it will persuade some men of wealth whose time hangs heavy on their hands to turn their attention to agriculture.

The lamented author of 'David Harum' thought it necessary to encumber his capital horse stories with a wretched attempt at romance, and Dr. Streeter commits a like blunder in mingling some lovemaking with the care of pigs and poultry. It does not follow because all these things went on together on the same farm that they should all go into the same book. We should, perhaps, have been inclined to pardon this disregard of the unities had it not been for the introduction of an episode of painful brutality. Two college boys, possessing all perfections, assisted by their coachman, repel an attack made on the ladies of their party by nineteen drunken miners. In the struggle one of the latter is killed; but the college boys must needs at once celebrate their victory with a revel largely devoted to getting the coachman drunk—although his reformation had been the aim of prolonged efforts. Their conduct may have been natural enough, and their valor magnificent; but when gentlemen represented to be of the highest breeding are introduced, it is necessary to take some pains with their manners and with their hearts. The author would have done better had he confined himself to writing about his "factory-farm," and not ventured into a field where any lack of refinement of feeling is felt like a discord in music.

The Adventures of Elizabeth in Rügen. By the author of 'Elizabeth and her German Garden.' The Macmillan Co. 1904.

Few Americans ever visit Rügen, Germany's biggest island, which lies in the Baltic, off the coast of Pomerania. The birthplace of the poet-patriot Arndt is now the haunt of Germans who desire cheap hotels, bathing, and scenery over which they can ejaculate "Wunderschön!" It happened that, one hot day in July, Elizabeth, weary of watching her garden turn brown in the sun, conceived the happy thought of exploring Rügen—the "island of twists and

curves and inland seas called Bodden; of lakes and woods, and frequent ferries, with lesser islands dotted about its coasts; with bays innumerable stretching their arms out into the water; and with one huge forest running nearly the whole length of the east coast, dipping down to the sea in places, and in others climbing up chalk cliffs to crown them with the peculiar splendor of its beeches." "The Man of Wrath" was left at home, distrustful as usual of such impulses, and Elizabeth set out to drive round Rügen in a victoria, in the society of her incomparable maid, Gertrud. She was ferried over, horses and all, to that delightful island, where the sky is a vivid blue, the shores a vivid green, and the sunlight bland. What Elizabeth really means by that unconventionality of hers of which she is always talking is merely that she prefers to be alone with the scenery. One of Rügen's attractions for her had been the entire improbability that she would meet any other person of her own class of society—the "Junker" class. The crowd of bathing guests of the lower middle classes she could avoid; but before her holiday was half over she encountered her own cousin Charlotte, who insisted on taking Gertrud's place in the victoria—and the fun, for Elizabeth, was at an end.

But not for the reader, who is now introduced to a personage seldom met with in English fiction, the German variety of the New Woman. Charlotte had thrown over the conventions of the Junker class, and had insisted on going to Oxford for an education. In her last year she met and married a famous German savant, "blinded," as Elizabeth says, "by the glory of having been chosen by the greatest man Oxford had ever seen." Education alone would have been enough to separate her from the Junker class; marriage with a man who was capable of wearing a white satin necktie in the evening placed her beyond the pale. Finally Charlotte became a lecturer "in the cause of Woman," and left her famous Nieberlein to his researches on the Phrygians. With her entry this glorified guide-book becomes really entertaining. Presently, by a happy accident, appears Nieberlein himself—one may expect to meet professors in Rügen—and Elizabeth embarks on the romantic enterprise of reconciling the New Woman to her old-fashioned husband. The reader will not regret, as she did, that in the interest of this scheme she saw less than she intended of Rügen itself and its rather monotonous beauties.

Some Recent Scientific Works

Chamberlin and Salisbury's Geology
By Professors Thomas C. Chamberlin and Rollin D. Salisbury, of the University of Chicago, members of the U. S. Geological Survey. With 24 maps, 3 tables, and numerous illustrations. American Science Series, Advanced Course.
Vol. I. GEOLOGICAL PROCESSES AND THEIR RESULTS. xix., 654 pp. 8vo, $4.00 *net.*
Prof. Henry S. Williams of Yale: "It is the best treatise on this part of the subject which we have seen in America."
Vol. II. GEOLOGIC HISTORY. (*In preparation.*)

The Mark Anniversary Volume
With portrait and 36 plates, several of them colored. 513 pp., quarto, paper, $15.00 *net;* by mail, $15.56.
This volume contains twenty-five original articles contributed by well-known zoölogists who were formerly Professor Marks's students at Harvard.

Noyes's (W. A.) Organic Chemistry
By Prof. Wm. A. Noyes of the Rose Polytechnic Institute. xviii+534 pp. 12mo. $1.50 *net.*

Wells's Tables for Chemical Calculations
With explanations and illustrative examples. By Professor Horace L. Wells of Yale. With thumb index. 58 pp., 8vo, $1.00 *net.*
This volume is designed to facilitate the use of logarithms in quantitative computations, and contains five-place tables, together with special chemical tables based upon the most recent data.

Kellogg's First Lessons in Zoölogy
By Prof. Vernon L. Kellogg, of Leland Stanford University. 363 pp. 12mo. $1.12, *net.*
Not an abridgment of the author's *Elements of Zoölogy*, but an entirely independent work adapted for high schools which do not undertake dissections.

Kellogg's Insects
With about 750 illustrations. About 500 pp. Square 8vo. (June).

Peirce's Plant Physiology
By Prof. George J. Peirce of Leland Stanford University. 291 pp., 8vo. $2.00 *net.*
A modern and thoroughly scientific discussion of the general principles of the plant physiology, intended for the student or general reader acquainted with the elements of botany.

Waters' Ferns
By C. E. Waters, Ph.D. (Johns Hopkins). With over 200 Illustrations from original drawings and photographs. 362 pp. Square 8vo. $3.00 *net* (by mail, $3.34).
Dr. F. H. Knowlton, U. S. Nat'l Museum: "The best fern book that has appeared yet! The illustrations are superb."

Atkinson's Mushrooms
By Prof. Geo. F. Atkinson of Cornell, with recipes for cooking mushrooms by Mrs. S. T. Rorer, etc. With 230 colored plates and illustrations from photographs. Second edition. 320 pp. 8vo. $3 *net.* (By mail $3.23.).
Educational Review: "It would be difficult to conceive of a more attractive and useful book."

JOHN LANE : NEW YORK

MEMOIRS OF

Henry Villard

Journalist and Financier

1835-1900

Two volumes, with Portraits and Maps
$5.00 *net*. Postage, 35 cents

An autobiographical record of the varied and romantic career of the war journalist who subsequently became a power in the financial world, and carried the Northern Pacific Railroad to completion. Full of incident and valuable for its reminiscences of Lincoln and other prominent men of the time, as well as for its descriptions of important battles of the Civil War.

"A book of extraordinary interest. It is written with great ability, in a clear and flowing style; it details with perfect candor the incidents of a great career; it is an admirable report of great events, all of which the writer saw, and a large part of which (after 1870) he was; it exhibits the rise and growth of a rich and powerful personality and a character at once remarkable for its simplicity and its variety." —John White Chadwick, in the *New York Times*, Saturday Review.

William Lloyd Garrison,
1805-1879.

The Story of his Life, told by his Children. Illustrated with over 40 portraits, views, etc. 4 vols., 8vo, gilt top, $8.00 *net*.

This important work (originally published by the Century Company) has been reduced in price from $12.00 to $8.00, a remarkably low sum for what is unquestionably one of the handsomest products of the American press.

"A masterpiece of modern historical biography. . . . To call the work a mine of information would be to convey a false impression; it is rather a well-arranged library in which attendant hands are always present to point the way to the exact thing wanted. . . . Finally, the work, while as instructive as the driest manual, is as interesting as a romance."—*Boston Advertiser.*

"A biography of almost world-wide importance. . . . It will be a standard work of reference."—*Charleston News and Courier.*

"In fact, Southern history is not complete without this work."—*Atlanta Constitution.*

"It is, for the anti-slavery record, final; and the service done to our national history is as great as that to a father's memory. Its one eminent trait, however, is its justice."—*Atlantic Monthly.*

*** For sale by booksellers. Sent, postpaid, on receipt of price by the publishers.*

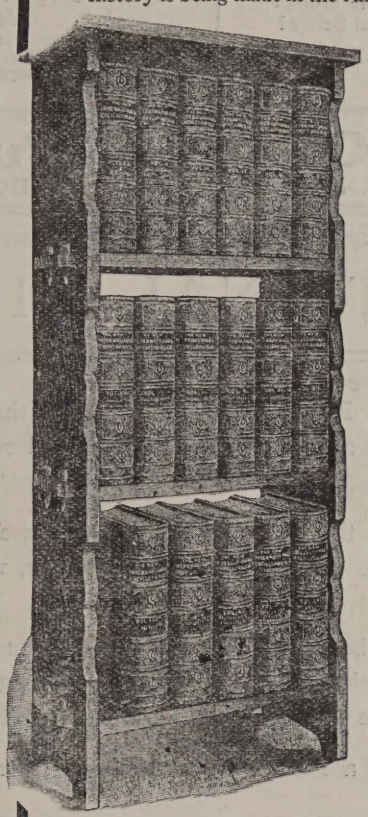
THE WAR IN THE EAST

Consult the New International Encyclopædia

Editors-in-Chief:
DANIEL COIT GILMAN, LL.D.
President Johns Hopkins University (1876-1902), President of Carnegie Institution.
HARRY THURSTON PECK, Ph.D., L.H.D.
Professor in Columbia University.
FRANK MOORE COLBY, M.A.
Late Professor in New York University.

History is being made in the Far East. Russia and Japan contend for what they consider their distinctive rights. Newspaper headlines speak of torpedo-boats, explosives, projectiles, rapid-fire guns, etc., etc. What part of Japan's victory over China did she fail to secure because of Russia and other nations? What is the cause of the present trouble? How does the present Japan compare with the Japan of 25 years ago? These questions are answered clearly and fully in the **New International Encyclopædia.** It also gives a variety of general information, collected and arranged by expert writers and editors. The army and navy of every nation is fully described, as, indeed, is every part of the soldier's equipment, from his rifle to the button on his coat.



Authoritative

Such eminent authorities as Dr. G. W. Knox, D.D., Dr. Robert Lilley, D.C.L., Dr. F. W. Williams, LL.D., have written the articles relating to Chinese and Japanese Language, Literature, History, etc. Articles pertaining to Military and Naval affairs have been prepared by such well-known specialists as Col. Edward Hunter, Leroy S. Lyon, Col. James W. Powell, Brig.-Gen. T. F. Rodenbough, Major L. L. Seaman, Major John T. Wisser and other well-known men.

If you would be ten years in advance of your neighbor, if you would have an equipment for reference purposes easily 50 per cent. more complete than any other work of the kind, obtain at once the New International Encyclopædia.

Test This Work

This work covers the whole field of learning from the most ancient times to the present day. 17 volumes, 65,000 articles, over 700 full-page illustrations, and a complete atlas of the world. Our maps of Japan and Russia show the latest developments in these countries.

A handsome eighty-page book has been prepared to give you information which we cannot insert here. It will be sent you for the asking if you will cut out and send the coupon to

IMPORTANT TEXT-BOOKS

BERGEN'S BOTANIES

Elements of Botany **Foundations of Botany**

These books represent the latest and most advanced methods of botany teaching, and combine a standard text, liberally illustrated, with a complete course in laboratory work, and a key for the study of systematic botany.

Botany Notebook *Just Published*

This notebook was prepared with the particular view of minimizing the amount of routine dictation for both teacher and pupil without doing any of the latter's thinking for him. Not only will it save time and trouble, but it will also lead the pupil to perform neat and accurate work.

AGRICULTURE FOR BEGINNERS

BURKETT, STEVENS, and HILL

A practical text-book presenting in concise and convenient form the fundamental principles of the science of farming.

NATURE BOOKS

NATURE STUDY AND LIFE

By CLIFTON F. HODGE

In the point of view, in the selection of the subject matter, and in the presentation of methods of conducting the work, this book marks a definite advance over other publications on the subject of nature study.

ATKINSON'S
First Studies of Plant Life

ACCOUNTING AND BUSINESS PRACTICE

MOORE AND MINER

A thorough, practical and comprehensive text for the use of teachers and students of bookkeeping. It is unique among bookkeeping systems in that it is easily adaptable to the requirements of classes and schools of all kinds.

GINN & COMPANY, Publishers

BOSTON NEW YORK CHICAGO LONDON

AN EDUCATIONAL DIRECTORY.

I.—*The Nation* stands alone in its field. It has a larger circulation than any other politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in *The Nation* has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

Life of John A. Andrew

War Governor of Massachusetts

By HENRY G. PEARSON

Two volumes, with Photogravure Portraits, $5.00 net. Postage extra.

This biography not only portrays Andrew in his daily labors as the war governor immersed in public business, engaged in the thousand pressing duties of that momentous time, but it shows also the larger aspects of his career—his public and private enthusiasms, his blazing patriotism, his broad statesmanship. The author has had free access to all public and private records and letters, and has produced an admirable biography.

ESSAYS, NATURE, AND POETRY

The Neighbor

By NATHANIEL S. SHALER

A scientific study of human relations with especial reference to race prejudices, such as arise in the contact of the Jews and Negroes with the Aryan peoples. $1.40 *net*. Postage, 10 cents.

Methods of Industrial Peace

By NICHOLAS P. GILMAN

A comprehensive account of industrial problems of the first importance. Trade-Unionism, Employers' Associations, Collective Bargaining, Conciliation, Arbitration, etc. $1.60 *net*. Postage, 14 cents.

Essays for the Day

By THEODORE T. MUNGER

Stimulating essays on religious and literary questions of the day by the author of "On the Threshold." A paper of much significance to church-goers is that on "The Church: Some Immediate Questions."

$1.00 *net*. Postage, 11 cents.

Guide to the Birds

By RALPH HOFFMANN

A complete guide to the identification of birds in the field, of New England and Eastern New York, treating of over 250 land and water species. Illustrated by Fuertes and others. $1.50 *net*. Postage extra.

With the Birds in Maine

By OLIVE THORNE MILLER

"It will entertain people who know little or nothing about birds, and will interest ornithologists who wish to learn of the author's Maine experiences."—*The Nation*.

$1.10 *net*. Postage, 10 cents.

The Fire-Bringer

By WILLIAM VAUGHN MOODY

A bold, dramatic poem giving a fresh interpretation to the story of Prometheus. *The Dial* says: "No other new poet of the past score years has displayed a finer promise upon the occasion of his first appearance." $1.10 *net*. Postage, 8 cents.

(*Ready in May*)

The *Cambridge Edition* of Professor Child's

English and Scottish Ballads

Edited by GEORGE L. KITTREDGE and HELEN CHILD SARGENT

The Standard Shakespeare

Revised Edition of Rolfe's Shakespeare

40 Volumes. Price, 56 Cents each

THIS most popular edition of Shakespeare is being thoroughly revised by Dr. Rolfe and reset in new size. The page is made smaller to adjust the volumes to pocket use. The Notes have been carefully revised, with some omissions and some additions. Many new helps to the student are included, and the new edition reflects the present state of Shakespearean criticism, as presented by one of the foremost authorities. Ten volumes are now ready in revised form, and others will follow at short intervals.

Correspondence from those interested is cordially invited, and will receive prompt attention

SCOTT-THAW CO., 542 Fifth Avenue, N. Y.

Colorado—

That's the title of a handsome new book of seventy-two pages, beautifully printed, bound and illustrated; fifty-six pictures of Colorado's matchless mountains, valleys, streams, lakes and forests.

The book is written in a most delightful vein and gives pleasing glimpses of a mountain world whose colossal beauty never wearies or changes or grows old. A splendid map of Colorado is appended.

It is not a guide book but contains a few paragraphs about the best way to reach Colorado from everywhere east and southeast via Chicago or St. Louis (Louisiana Purchase Exposition) and the Burlington Route, with its splendidly equipped one-night-on-the-road fast express trains.

LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

GEORGE FOX:

An Autobiography

Being the Story of his Life as told in Selected Passages from his Journal. Edited, with Notes and an Introduction, by RUFUS M. JONES, M.A., Professor of Philosophy in Haverford College.

Two volumes, 12mo, cloth, gilt top, with maps of his journeys in England and America, and numerous illustrations. Postpaid, $4.00 *net*.

Students' Edition, in one volume, without the illustration. Cloth, postpaid, $1.50 *net*.

PRESS NOTICES

". . . We have in the two volumes before us a really valuable missionary labor, which is bound to bear fruit. It will open the pages of this unique record of spiritual experience to many who would never read it otherwise, and so help to a better understanding of the great movement of which George Fox was the central figure."—*Philadelphia Ledger*, January 17, 1904.

". . . In the transcription of the Journal . . . Dr. Jones, by careful and judicious editing, has produced a continuous narrative. It is a dramatic story. . . . Expunging the multiplicity of theological discussions with which Fox himself interspersed his narrative, the editor has reserved the personal narrative alone, which shows us forth George Fox himself, in his own day, and in his own historical setting. . . . The copious footnotes and the frequent illustrations add much to the charm of an already charming work."—*Boston Evening Transcript*, February 17, 1904.

". . . The abridgement and editing are by Rufus M. Jones, professor of philosophy in Haverford College, who, though evidently himself one of 'the people called Friends,' makes no exorbitant claim for Fox, and in his notes and introduction exhibits a degree of detachment that deserves remark and praise. . . . The introduction is happily conceived, and the notes convey, in almost every case, information that illuminates the text. This appears to have been abridged from the edition of 1694 in a judicious manner."—*The Nation*, March 3, 1904.

THE INDEPENDENCE OF THE SOUTH AMERICAN REPUBLICS

A Study in Recognition and Foreign Policy

By FREDERIC L. PAXSON, Assistant Professor of History in the University of Colorado, and Sometime Fellow in the University of Pennsylvania. 12mo, cloth, $2.00 *net*.

"The title to this excellent little volume gives its intention and scope, and Mr. Paxson has, with rare restraint, confined himself strictly to his subject. . . . [He] outlines clearly the rise of a doctrine of recognition, and as clearly recounts the events passing in South America which led to the revolt against Spain and eventually to independence. . . . His study is based upon original resources. . . . Mr. Paxson has justly emphasized the influence of John Quincy Adams."—WORTHINGTON C. FORD in *American Historical Review*, January, 1904.

"This little book, which reviews comprehensively and brilliantly the inception and culmination of the revolts of the Spanish colonies in the Southern continent, is especially timely to-day."
—*Boston Transcript*, September 2, 1903.

"Mr. Paxson has done one signal service in bringing out the fact that even more completely than has been surmised, John Quincy Adams was the real head of the Monroe Administration, and was the real power behind the throne as regards the Monroe Doctrine. Furthermore, the author shows that the Monroe Doctrine itself was in process of formation for many years before it was enunciated in 1823. Finally, the present study throws new light upon the rivalry between John Quincy Adams and Henry Clay. Thus we have a work which will attract the immediate attention of every student of American history, and the attention will be well repaid."
—*The Outlook*, August 29, 1903.

FERRIS & LEACH, Publishers, PHILADELPHIA

The Nation.

NEW YORK, THURSDAY, APRIL 14, 1904.

The Week.

Mr. Cleveland's declaration for Judge Parker has "thrown the Bryanites into a rage." But is not this their normal condition? So far as our observation goes, they are never really happy unless angry. And as for turning them against Judge Parker, they were against him long before Mr. Cleveland's interview. They had already detected alarming symptoms of sanity in the New York candidate. Of his political opinions, they knew no more than the next man, but the mere fact that his eye did not roll, that he was cool and quiet, and associated with intelligent people, was enough for them. So they instantly began to cut themselves with knives and to grow frantic, after the fashion of the prophets of Baal. Republican editors are shaking their heads pityingly over these signs of Democratic discord. But the general conclusion will be, we suspect, that it was a peculiarly lucky day for Judge Parker that brought him, with Mr. Cleveland's endorsement, the threat of war to the knife by Mr. Bryan. Mr. Bryan's political estate is rapidly becoming one of vanity and vexation of spirit. Indeed, it is almost pitiful. He is reduced to a strange combination of helplessness and effrontery. Whatever he had left in the way of a personal machine has been boldly bought up by Hearst, and he is now little but a tail to that ignominicus kite; yet he shouts as loudly as ever. But it is the cry of a despairing man. Even in his own State he is making pathetic appeals to his old friends not to desert him; and with a really ludicrous failure to perceive the indelicacy of it all, he calls for subscriptions to his paper, the *Commoner*. Whether he is trying to save his party organization or save his newspaper, people will find it hard to decide. At any rate, it is the strangest of campaign slogans yet raised: "Now is the time to subscribe!"

The action of the Kansas Democratic convention on Thursday will be taken, on the whole, as marking a further decline of the Hearst movement in the West—and it is only there that it has had any real strength. Three weeks ago it was thought impossible to prevent Kansas Democrats from going madly for Hearst. On Thursday, however, his followers were not in control of the convention, and numbered only a minority of the delegates chosen. A "harmony resolution" was adopted, expressing admiration for his attacks upon the Coal Trust, but nothing was said about his Presidential candidacy. This was bad enough as it stood, and every such dallying with a notoriously unfit man must hurt the Democratic party East and West; but, considering what was claimed in advance by the Hearst boomers, and what was feared by his opponents, the result is a distinct setback for the unspeakable candidate. Many will agree with the comment of a shrewd observer in this city: "Well, if Hearst cannot do better than that in a sure Republican State where Democrats come cheap, it is all up with him."

Mr. Roosevelt, the well-known author, openly censured, in his speech at the publishers' dinner in Washington on Thursday night, some of the tendencies of Mr. Roosevelt the President. This plain-spoken literary man had strong words of condemnation for all empty national boasting, especially for the use of language which might give offence to foreign nations. Evidently he had in his mind that series of speeches, made by a peripatetic President last year, which so fluttered all the European dovecotes. That rash public man whom Roosevelt the writer has now so effectively rebuked, took precisely the "big-stick" tone which is so offensive and dangerous in the mind of the author who entertained the publishers with a plea for sobriety and restraint. At Tacoma, for example, on May 22, 1903, the President declared that this country must be "dominant" over the Pacific Ocean, and that we must have a fighting navy able to cope with that of any "great Power" that might "throw off the restraints of international morality." Little did he think then of being taken to task one day for such inflammatory utterance by Roosevelt the bookman! Nor did Mr. Roosevelt, the dweller in the still air of delightful studies, spare that President who has been bidding his countrymen "play a great part" in the world and go forth to "police" all nations. To the clear gaze of that cultured maker of books, Theodore Roosevelt, all this appears as both silly and unpatriotic. "When all is as it ought to be in nation and State and municipality, here at home, we can then talk about reforming the rest of mankind. Let us begin at home." So true is the saying that a statesman who is also a littérateur bears a sword with two edges. One of them he can turn against himself.

Additional protection for the President—any law that will make his life more inviolate—is heartily desired by all good citizens. The bill now before the Senate does not, however, accomplish this end. The minority of the Committee on the Judiciary raises the objection that the bill puts the President, Vice-President, Cabinet officers, and foreign ambassadors and ministers—say fifty men in all—in a superior and distinct class, entitled to a higher degree of protection than other officials, citizens, and inhabitants of the United States. The plea against class legislation is weighty, but it might be overborne were there positive merits in the measure. As a matter of fact, there are none. The present law affords all the protection that any law can afford. Nothing can be gained by punishing with death an unsuccessful assault with intent to kill. The hand of a Presidential assassin would not be stayed for an instant by the expectation of death in case of failure. The criminal hopes to murder, and he looks for nothing but capital punishment. We do not increase the dignity or safety of the President by writing a bloody statute upon our books.

The Recessional should have been sung while the House was voting on the Philippine Shipping bill. The Spight amendment, deferring until 1909 the application of our coastwise laws to the Islands, was rather more than the "stand-patters" could swallow. It was bad enough to have to allow the Philippines until July, 1906, to get ready for the change, but some concession had to be made to decency. Under the decadent rule of Spain, the Manila merchants could ship their goods to other parts of the world, or to their fellow-colonists, in the vessels that would carry them the cheapest. One flag was as good as another to them for this purpose. But that is altogether out of keeping with our ways. Our motto is, "The flag and an appropriation"; only, in this case, we propose to furnish the flag and make the Philippine merchants furnish the appropriation. By limiting their trade to American ships, we shall, of course, make them pay higher freight rates than before. But we take good care to remind them that, though they are in the United States, they are not of it. The Islands are a part of our coast line, but they are foreign territory when they attempt to ship their products to this country. Goods carried from Boston to San Francisco by water have to go in American ships, but they do not pay duties on arrival. We apply the first half of this policy to the Philippines, but not the last. No doubt the Filipinos are anxious that some power should stir up our conscience, "Lest we forget." Is it possible we have forgotten the British Navigation laws, and the part they played in bringing about the American Revolution?

The full report of the Senate's memorial oratory in honor of the late Senator Hanna leaves one marvelling that the most august legislative body in the world has no more adequate method of eulogizing its dead. Senator Hanna had not left a great mark upon national legislation, so that there was hardly material for a comprehensive funeral oration. But he was a man of singular capacity for friendship, and his death was a matter of real regret to most of his associates. It was fitting that some brief and simple expression of this personal regard should be made, and it is not surprising that as many as fifteen Senators spoke. What is surprising is that, dealing with a very simple theme, they should have managed to fill thirty columns of the *Congressional Record* with stilted rhetoric and whatever commonplace gleanings of poetical scraps were supplied by their private secretaries. Of course, there were exceptions. Mr. Foraker's staccato paragraphs show at least the desire to be generous without being fulsome toward a departed adversary. Mr. Blackburn's address was a handsome appreciation of a political opponent. Much may be forgiven to the personal grief that led Mr. Scott into hero-worship of very doubtful taste, while Mr. Beveridge's rhetoric gilds impartially empire stretching beyond the setting sun, and the funeral pomps of a friend. Others, too, were not wholly unworthy of the occasion. But what shall be said of Mr. Elkins's pious periods, interlarded with verse; what shall be written of the other eulogies that begin with a poetical quotation and end with a prayer? In a way, the least said about them the better.

Weighty and admirable words were pronounced by Judge Adams at St. Louis on April 5 in sentencing Senator Burton. The latter may obtain a new trial, and may even be welcomed back into the Senate, but an ineffaceable stigma has been put upon him. As the judge said, the great lesson of his conviction is that "public office is not a sure or safe passport to private thrift." Burton was careless and got caught. He may well protest that he is no more blamable than thousands of other officeholders, except for being less cunning than they. But the law of the land has now laid its heavy hand upon him. It should be a solemn warning to all engaged in the kind of crime of which he has been proved guilty. Many a Senator should tremble as he reads the remarks of Judge Adams, reasoning of righteousness and judgment to come.

Secretary Moody's guarded references, in his annual report, to the project of a General Staff for the Navy have now passed into open opposition. Before the House Committee on Naval Affairs he argued strongly on Monday against the creation of a body which might usurp the authority of the Secretary himself. Under our system, a civilian must be at the head of the navy, responsible to the President, and he to the people. Mr. Moody made it very plain that he feared lest an overweening General Staff should impair that full control and employment of the navy which ought to rest with the Administration. But the Secretary is a firm believer in seeking expert advice and in making the navy as efficient as possible. Hence his advocacy of the bill to create a general board of technical advisers to the Secretary, the detail of officers composing it to be regulated by law. The measure seems to be a sensible compromise. It may not be passed by Congress this session, but it is certain that the General Staff bill will not be.

Joseph W. Folk seems likely to be nominated by the Democrats for Governor of Missouri. His boom is an example of popular uprising in the teeth of machine opposition, for there is no man in the State more bitterly hated by the machine men of both parties. When he began his work in St. Louis as Circuit Attorney—the office corresponds to that of district attorney here—he found that the criminals who were robbing the city and State were the machine ring, backed by a certain number of presumably respectable bankers, street-railway and gas "magnates," and brewers. There is no politics in "graft," and both Democrats and Republicans were busy carrying off all they could lay hands on. Mr. Folk followed the trail of corruption up to the Lieutenant-Governor, and he even found footprints pointing to the door of United States Senator William J. Stone. He has fought the thieves in spite of the vast political, social, and financial influence they could muster. He has made his campaign for the nomination strictly on an "anti-boodle" issue. The machine has exerted all its power, but Folk is sweeping the primaries, and is demonstrating afresh the truth that the people have not forgotten their ancient faith in courage and honesty.

Gov. Odell may not desire to "go out in a blaze of dishonor," but the Legislature has no such false pride. The closing days of the session have been marked by a commingling of trickery and effrontery rarely seen. Whatever else may be said about the Elsberg Rapid Transit bill, its apparent throttling in the Assembly is an obvious breach of good faith. The distinct understanding was that all three rapid-transit bills were to be passed. On that condition alone were they got through the Senate. The agreed plan was to send all the bills down to Mayor McClellan, and let him decide which ones to accept for the city. But, once in the Assembly, or, rather, in the hands of the Committee on Rules—*alias* Speaker Nixon—the jugglery began. The other bills were reported out and passed, but the Elsberg bill was "put to sleep." Now, this raises an issue more vital than that of rapid transit or municipal control. The question is, Are we at the mercy of legislative cheats? Are our representatives at Albany men of honor, or are they mere thimble-riggers? The matter comes back ultimately to Gov. Odell. The Legislature has pretty clearly given the State its measure. All accounts agree, Republican correspondents uniting with Democratic in the verdict, that these last days have been a very riot of corruption. Bills which could be neither defended nor explained have floated through on a wave of "deals." All these have yet to go before the Governor. What he does with them will best show his future plans. If he means only to set up as boss, caring nothing for public opinion and perfectly willing to have Roosevelt lose the State, he will leave the plunderers undisturbed.

Gov. Pennypacker of Pennsylvania has at last been shamed out of his plan of resigning his office to become a candidate for the Supreme Court. It was all a clever little scheme of the Republican machine to "side-track" Pennypacker, and to use the remainder of the Governor's term in the way in which it "would do the most good to Quay." This last consideration should alone have been enough to deter an upright public officer, and, in addition, Gov. Pennypacker had given the people a distinct pledge that, if elected, he would serve out the full term. In spite of this, he has dallied and shuffled, and it was generally supposed that he would do the bidding of the boss. It appears, however, that public opinion has been too much for him. The State bar had expressed itself in the strongest terms; the press has been almost a unit in denouncing the Governor's proposed resignation. In the end, he retreats. That is always difficult to do gracefully, and it seems particularly comic in the case of Pennypacker, who had so valorously proclaimed his superiority to newspaper criticism.

"The strike is hell," said Bishop Spalding last week before the House Committee on Labor at Washington. No one can question the Bishop's friendliness for labor, and he has never shown it more clearly than by this statement, apropos of the Foss arbitration bill. He does not deny that strikes, like war, are sometimes necessary. The strike, he believes, is the great weapon of labor organizations, and to deny the right to it would be to deny the right to organize. Though the Bishop admits the possible usefulness of this way of settling labor

disputes, he evidently thinks that it has not, on the whole, improved things. Men who have been out on strike have gone back to work injured morally. Even the children have learned evil ways. And as to the relations of capital and labor, Bishop Spalding believes they are not improving. It is worth noting that while he was warmly advocating a Federal arbitration law, he failed to speak in unqualified approval of the most signal attempt so far in our history to settle labor troubles by Government aid. He believed the Anthracite Coal Strike Commission did great good, but he said that some evils had resulted from it. In many cases it had encouraged labor leaders to make demands not at all times justified by conditions. It was not shown, however, that a permanent tribunal would be any more successful. Bishop Spalding believes that the proposed arbitration board would never be called on to determine what is a legitimate profit on capital. Its province would be to settle disputes as to "hours, treatment, and pay." It is rather hard to see how such questions could be raised without at the same time bringing in the question of profits. The first claim of a body of strikers is that their employers are making money enough to pay them more wages. The bishop says that wages should be determined by the cost of living. They not only should be, but they are; so that, despite anything he may say, the work of a Federal arbitration board would most likely be confined to the question of what is a fair profit for capital and what the cost of living for labor. Bishop Spalding affirms that where a business does not permit the payment of living wages, "according to the American standard of living," it ought to be closed up. But what is the American standard of living? Is it fixed and immutable?

Honor and personal veracity, we are told, are the very basis of business in Wall Street; but the testimony in the Sully case hardly bears out the theory. On the face of it, Mr. Sully with two associates agreed to squeeze a rising cotton market for all it was worth. It was a personal, not a business, transaction. Orders were given by word of mouth and without memorandum; Mr. Sully did the buying without margin or collateral; profits were divided informally at a series of meetings, which, apparently, had the character of afternoon teas. Large portions of the winnings were turned over to one member of the pool for distribution to the others. No two fishermen who whipped a stream together, or amateurs who cracked a safe, ever made a more friendly division of the booty. Gamblers usually exact the formality of an I. O. U. when no cash passes; with these gentlemanly cotton speculators it was only a matter of "Dear boy, buy me 20,000 bales, if you and the fellows are in." Unhappily for those who maintain that Wall Street is the favorite abode of naked truth, these idyllic manners were only for a rising market. Mr. Sully had never demanded cash for the speculative holdings of his associates, but he was forced to give cash, on strictest business principles, when the sale of those holdings meant the hastening of his ruin. These gentlemen who had conducted vast transactions orally in the cheering aroma of the tea-room, suddenly became very pedants for accounting. We leave all sporting men to judge whether one may lean on a successful gambler in his prosperity, but "give him the marble hand" when his luck forsakes him; for the whole matter lies in a sub-moral plane, where the ordinary ethics of business seem to fail.

The details of the Anglo-French treaty only put its comprehensiveness and wisdom in a stronger light. France has gained notably, but at no cost to England. Special commissions to the Hague Tribunal will adjudicate the few outstanding disputes. Apparently, every cause of present or potential friction has been removed. France gains in the Southern Sahara at the expense of British Nigeria, thus getting a better route between Lake Tchad and the Niger. As an offset, and for the recognition of her predominance in Morocco. France agrees never to fortify the north coast of Africa near the straits. The disputes owing to French occupation of the Newfoundland coast go before the Hague Tribunal, which will award damages. England concedes unchallenged occupation of the tiny Los Islands off the coast of Sierra Leone. The New Hebrides, which are held under a vexatious joint protectorate, will be the care of a new joint commission. In Egypt and Madagascar bygones are to be bygones. In Siam the convention of 1896, which practically only bound both Powers to keep out of the Menam valley, is reaffirmed. France gets navigation rights on the Zambesi. Best of all, Egypt and Morocco are to be open on equal terms to the world's trade for a period of twenty-five years. In general, the treaty should be hailed with joy at Paris; and, if England has done practically all the yielding, she gets more than an equivalent in the good will of her traditional rival.

Major Seeley's unopposed return from the Isle of Wight is another of those pin pricks which must sooner or later drive the Balfour Ministry into nervous collapse. He voted with the Opposition, it will be recalled, on the Transvaal Chinese Labor act, at the same time resigning his seat. His constituency have given him a handsome vindication, and have sent him back to St. Stephens no longer a Unionist, but an Independent. Mr. Balfour did not venture to run a regular candidate against this popular insurgent. It would be hard to beat Major Seeley, the hero of a gallant rescue on the coast, in his home constituency. But all observers must see that his case may prove a precedent for other disaffected Unionists. Mr. Balfour has for some time made it a virtue to grant his followers perfect freedom of opinion; now, apparently, he does not even require their votes. Free traders, retaliators, and protectionists are theoretically supposed to live in amicable debate together, while the Ministry tacitly agrees to present to its own divided supporters only non-contentious measures. Clearly a responsible Government cannot stand very long on this basis.

A minor skirmish in Tibet and reports of the concentration of the Lama's troops in defence of Gyangtse show that war is probably inevitable. Against the protests of China, Lord Curzon has refused to arrest the expedition. Had this been done, the killing at Guru might have been compounded, and negotiations begun. But Col. Younghusband has orders to negotiate at Gyangtse or nowhere. There he can hardly get without fighting, and another battle will commit England irretrievably to an immensely difficult and expensive war. No wonder the average Englishman at home is beginning to ask if too great a price is not being charged that the stealing of a few yaks may be avenged, that a little tea may be exported, and that Lord Curzon may add to his present distinctions the title of Duke of Lhasa.

A careful analysis of the Tibetan correspondence in India reveal the Younghusband expedition as chiefly an expression of Lord Curzon's impatience. At successive points protests were received from China, accompanied by professions of willingness to treat when a viceroy en route should arrive. These representations were wholly disregarded, as were observations on the unnecessary strength of a nominally diplomatic escort. Lord Curzon declined to be turned from his plan of negotiating with a brigade. It should be recalled also that the last Tibetan treaty, that of 1893, had expired under a five years' limitation. The total offending of Tibet was the giving of a trade preference to the suzerain, China—the policy Canada adopts to-day. In pure morals, then, the Younghusband expedition was as indefensible as would be the dispatching of Gen. Chaffee and a division to Montreal in order that Canada might be forced to give us the terms she gives England. There can be few more discreditable chapters in the history of diplomacy, or, for that matter, of treacherous conquest.

THE PRESIDENT AND THE LAW.

An instructive light is thrown upon Mr. Roosevelt's attitude towards law by the report of his Civil Service Commission, which was sent to Congress on Tuesday week. It covered suspensions of the civil-service law by successive Presidents, and revealed the surprising fact that Roosevelt's name led all the rest. Sixty times during his less than three years in office has he availed himself of his power to set aside the law. McKinley had done it but three times. Yet no one can doubt that Mr. Roosevelt has a reformed and legally protected civil service more at heart than his predecessor had. In fact, he has done a vast deal for that cause. As the Commission point out, he transferred 294 exempt positions to the competitive class by the revision of the rules a year ago. More than one of the schemes of the spoilsmen in Congress to break down or nullify the law, the President has neatly foiled. All this is to be admitted, yet it only heightens the special wonder with which we see him brought in guilty of this amazing list of suspensions of a law of which he is the peculiarly zealous champion.

We can account for it only on the hypothesis that the President thinks of a law rather as a convenience than a guide and rule. He is absolutely confident of his own good intentions, while statutes are meant for the restraint of the bad. As Civil Service Commissioner himself he would vociferously call Senator Gorman to book, but how can any man question his own pure motives? The thing that he very much wants to do becomes, *ipso facto*, the most desirable course of action conceivable. All obstacles to it are to be impatiently brushed out of the way; and if a legal obstacle exists, out of the way that goes, too. Thus, he greatly desired to appoint his old friend Joe Murray to be assistant commissioner of immigration at this port. But the office was in the competitive class. It was, of course, absurd to think of Joe winning in competition, so the short-cut was taken of suspending the law and shoving the President's incompetent friend right into the office. Similarly with the 59 other suspensions. All of them were with the aim of getting something "done"; and that the law was "done" in the act does not seem to have troubled the President in the least.

Whether it is due to defective education, or is a case of what the novelists call "imperfect sympathy," the unfortunate fact is pretty clear that the President has a peculiar conception of the purport and force of law. This was most innocently displayed in his recent pension order, which troubled and silenced so many of his friends. We observe, by the way, that the *Tribune* has at last found its voice on this subject. Perhaps it could no longer rest under Mr. Smalley's telegraphing to the London *Times* that the pension order was so bad that not even the *Tribune* could defend it. Its defence is, however, as lame as it is belated. It does not touch the real point, which is that the Executive undertook to give to an order of his the same validity as an act of Congress. This was brought out with the utmost simplicity in the terms of the order itself. "Whereas," it ran, "by act of Congress in 1887, when thirty-nine years had elapsed after the Mexican war, all soldiers of said war who were over sixty-two years of age were placed on the pension roll"—therefore, what? Congress should now pass an act doing the same for veterans of the civil war? No; just a simple "ordered" that what Congress had then done by law, the President would now do by fiat.

This whole matter has very properly been referred to the Judiciary Committee of the Senate to determine if the President has exceeded his power. It is no defence to say that similar rulings have been made before. One illegality does not warrant another. Senator Mallory, who discussed the subject in the Senate in so lawyer-like a fashion as to win a compliment from Senator Spooner, brushed aside all the *tu-quoques* in which the *Tribune* takes so much satisfaction, and pressed home the question whether, in 1904 as in 1893, power had not been assumed by the Commissioner of Pensions, acting under the President's order, which he did not lawfully possess. Any one who wishes to get at the exact legal nub of the business would do well to read Senator Mallory's speech, especially his colloquy with Senator Spooner. The latter came very near admitting that the President had usurped one of the Constitutional powers of Congress.

If Senator Spooner is not careful, he will acquire a reputation similar to that of a great medical expert—that of being called in principally in dangerous cases. It has already got so that people shake their heads and say the President must have been in a more critical condition than was thought if Dr. Spooner had to be sent for. Several times before last Saturday's consultation over the acute attack of pension-order, has the Wisconsin specialist put the other practitioners aside, and told how to pull the patient through. It is, no doubt, pleasant to be bulletined as the skilled physician who saved the sick man's life when others failed, but it has to be saved so often! One complete defence and vindication of President Roosevelt has hardly ceased to reverberate in the Senate before Mr. Spooner has to undertake another. He is a born debater, and seems to enjoy taking a retainer to extricate a client from any scrape, no matter how black-looking. But it must occur to him sometimes that his powers might be more worthily employed. There was once a Senator who was known as the Defender of the Constitution. The mere title of Defender of the President is not one, we should say, that Senator Spooner would prefer.

The pension order shows us not only how singularly insensitive Mr. Roosevelt's temperament is on the side to which law appeals, but also how dangerous a north star to sail by may be his larger good. He was after votes. Putting technical disputes one side, the order would never have been issued except to help the President's reëlection. That is the real larger good before which everything else must give way. To persuade grave-minded citizens that a candidate acting on that principle, and careless of his means, is a safe man, will require more than the certificate of Gen. Grosvenor, more than the whitewash of ex-Secretary Root, more than the casuistry of Senator Spooner.

USURPATION AS AN ISSUE.

Mr. Bourke Cockran's brilliant speech in the House on Saturday not only perturbed the Republicans, but actually won votes from them on a division. It was on the theme of Executive usurpation. Of this, the Democratic party is obviously preparing to make a political issue. It cannot be denied that they have plenty of material.

We do not remember any period in recent history—not excepting the second Administration of Grant—when there has been a greater readiness on the part of the Executive to attempt encroachments on the rights of House and Senate, or greater success in such attempts, than in the past few years. In several conspicuous instances—that of the "constructive" recess, that of reading into an appropriation bill the word "Panama" for "Colombia," that of the recent pension order—the President has effectively nullified the prerogatives conferred by the Constitution upon Congress. He has acted in these matters very much as if he were defying his opponents to impeach him, but he seems to have come out of each encounter stronger and more lawless in temper than ever.

In much the same way, last year, the Executive solved the currency question by decreeing what should and what should not be surplus reserves—a matter down to that time not dreamed to be anything but legislative. In fact, during this Administration, construing out of existing law or treaty permission to do something which it never contemplated, has come to be a regular means of overriding the difficulties presented by the Constitutional division of powers. All this is, of course, the baldest sort of usurpation—much more defiant than the gentle means of overcoming opposition in the treaty-making branch so persuasively employed by McKinley and so ably explained by Mr. Hoar in his autobiography—namely, that of retaining Senators in advance to do executive

work which must afterwards come before themselves as Senators for ratification. This is, too, just the sort of usurpation that had been predicted as inevitable ever since the Philippines were seized and the colonial policy launched. The Imperialist who finds that he gets on successfully abroad with no law, will always resort to it as little as possible at home. This is what has always happened elsewhere; now it has happened here. At bottom, the Anti-Imperialist issue and the anti-usurpation issue have been all along one and the same.

How far the Democrats will be able to make use of usurpation as an issue is, however, another matter. Many of their present leaders have made the mistake from the first of thinking that they could profitably curry favor with the expansionist sentiment of the country, while, if anything like usurpation should be attempted at home, they could then rally round the Constitution and defend the rights of the two houses and the people as Daniel Webster or Charles Sumner would have done. But this is exactly what an Opposition has not the power to do. When Senator Gray signed the Treaty of Paris, after protesting against it, and it was ratified by the aid of Democratic votes, he and those who helped him struck a blow felt ever since. It was they who paved the way for all the acts of domestic usurpation of which such bitter complaint is now made. From condoning and trying to take advantage of the Philippine iniquity, it was not a long step to helping ratify the Panama treaty. On their theory, the constructive recess, the surplus-reserve decree, and the pension order should have aroused a storm of opposition; but by that time the faculty of opposition had become partly atrophied or paralyzed.

All this will handicap them in drawing up a platform. It is difficult for the same men to let usurpation have full swing at Washington, and then arouse the masses about it like lion-hearted Jeffersonian Democrats. Their words may be very fine, but to judge by their acts they would themselves be usurpers, given the opportunity. Even about the pension order they are afraid to say much, because they themselves stand in awe of the Grand Army vote. After all, they feel, it was a good trick. To those who remember that down to 1896 an issue relied on in every campaign was the dangerous centralizing tendency of the Republican party—a centralization always tending to despotism and usurpation—the situation is perplexing; to Democrats who remember what a glorious cry it made for them under Tilden, a distressing one.

Yet all of these considerations have an obvious relevancy to the movement to nominate Judge Parker. A blameless judge, who has been on the bench of the courts of last resort of his State for eighteen years, may certainly be thought to represent law and Constitutional restraints on the Executive very well, as against a candidate whose sole political principle, as elucidated by his friends, is to "do things" for the sake of the "larger good." Moreover, Judge Parker's skirts are clear of all complicity in the lawlessness of the past six years. He has not helped on, as have half the Democrats at Washington, the work of destroying the Constitution. When Bryan took up the anti-Imperialist issue in 1900, people laughed because he advised the ratification of the Treaty of Paris. But, so far as is now known, with Judge Parker as a candidate, Anti-Imperialists, Cleveland Democrats, Cleveland Republicans, Independents, and the independent press could all unite in supporting him as the champion of Constitutional liberty against unprincipled lawlessness. The issue is all the more important because in this election very little but the Presidency is at stake. For the next four years Democratic legislation is out of the question. But whether we want Executive usurpation to go on or not, we can settle out of hand.

NEEDS OF AMERICAN SHIPPING.

The House bill to provide for a commission to report on the American merchant marine has given Representative Rainey of Illinois the opportunity to say a few things that will surprise most persons. The commission is to travel all over the United States. In Mr. Rainey's opinion, the farther it travels the farther it will get away from the real sources of information. You cannot, he says, study problems of navigation at the banquet table or out of parlor-car windows. The commission will be dined and wined by boards of trade and city councils, but will add nothing to the literature of the subject. The Library of Congress already contains nearly 2,000 works on ship subsidies. That the object of the proposed commission is to work up sentiment in favor of a ship-subsidy measure seems clear. Indeed, the Committee on Merchant Marine and Fisheries, in reporting the bill providing for this peripatetic board, frankly declares that strong appeals have come from the West for action in favor of subsidies, and a compilation of their views "will aid Congress greatly in the discharge of a duty that seems at this time to be absolutely imperative."

But when the actual situation of the shipbuilding business is reviewed, the duty does not seem quite so imperative as the committee implies. That the industry is in a depressed condition just now, nobody can deny; but that is not peculiar to this country. That there has been money in the business, despite the lack of subsidies, is easily shown by the census figures in the matter of wooden ships; but that is because wood could be produced in this country as cheaply as in England and Germany. The companies building steel vessels have had hard sledding in many cases; and particularly of late, owing to the general decline in the demand for freights, and to the injection of large amounts of water into their capitalizations. The shipping business at best is very precarious. The demand for tonnage has fluctuated in a most violent manner in the last decade, and rates have risen and fallen in an erratic fashion. Foreign governments do not take the view that they should protect the industry against such dangers. Great Britain allows its shipbuilders to buy their material where they can get it cheapest. This country is blessed above all others in its supplies of iron and in the intelligence of its workmen, but we dump iron and steel in Great Britain and Germany at a lower figure than the producers of those countries, while our mills cannot, or will not, make prices at home which will enable the United States to build up a merchant marine for its foreign trade.

To develop a large ownership of vessels is of more importance than to create artificially a large shipbuilding industry, but there is no good reason why we should not pursue both lines successfully. If our yards cannot turn out vessels as cheaply as foreign yards, the people of this country should be allowed to buy their ships abroad. But they would not be compelled to do so if our builders could get their material on equal terms with European constructors. With steel plates selling in this country at $41.40 a ton, against $25.50 in England and $30.23 in Germany, there is little chance of a great amount of tonnage being built here for the foreign trade. In some cases, under our navigation laws, it pays to build here even at a higher cost. This is illustrated in the case of the two great steamers now being built in this country for the Great Northern Steamship Company, the *Minnesota* and *Dakota*, each of 21,000 tons register. The cost of these is greater than if built abroad. The vessels are to ply between this country and the Orient, but if built in Europe they could not touch at any two American ports.

Mr. Rainey has gone to first sources for his information. He has drawn some valuable testimony from the Cramps. Here is their statement, and it goes pretty near the heart of our shipping troubles: "As it is at present, we are entirely at the mercy of the combination of the large plate-mill interests of the country, who have established 1.75 cents per pound (about $40 per ton) as a base price for steel plates, as against $25 a ton for the same class of materials in Great Britain." In other words, American shipyards are at the mercy of a steel monopoly fostered by the tariff. In 1897, steel plates in the United States fell practically to the British

price, and in 1898 they even went slightly below it. But in 1899 the price shot up very much above the British quotations. Our steel manufacturers are working more as a unit now, and are trying to make American consumers pay high prices while meeting the foreign markets at the world's price. They are not succeeding in every case. The Cramp Company wrote to Mr. Rainey on March 11, 1904, that the United States Steel Corporation was then seeking a foreign market for its surplus products, and that in case a shipbuilder should threaten to purchase any of his materials abroad it would lose no time in modifying its prices to such an extent as would place the American builder on a more equal footing with the foreign builder. Under such conditions, state the Cramps, the Steel Corporation would consider such materials "in the nature of export articles"; and they say that they know of cases where the price has been lowered in this way.

But, unfortunately, such reductions apply only to material to be used in ships exclusively for foreign trade. In such cases the steel comes in duty free. But, as already stated, such ships are practically out of the question. Business from this source is too insignificant to cut much of a figure. The fact is, the entire steel and iron shipbuilding industry of the United States is at the beck of a Government-fostered monopoly. If a large American merchant marine is desired, the work should be begun at that end.

HIGH RENTS AND THE UNIONS.

The present excitement on the East Side, caused by a general increase in rents, has been brewing for some time. For the last two years rent has been going up, and not only in the district south of Fourteenth Street. It has risen also in Harlem, in the Bronx, in Brooklyn, and in suburban towns. Though several fantastic explanations are offered, such as the alterations in old buildings required by the new tenement law, higher taxes, and the rapacity of landlords, the real reason is perfectly plain. Like everything else, rent schedules are regulated by the law of supply and demand. In the last three years there has been very little building of apartment houses and tenements in Manhattan. On the lower East Side, where evictions are now so frequent, there is probably less actual housing space than in 1902. Great areas of buildings have been demolished to make way for schools, parks, bridge approaches, and other public improvements. The approach to the Delancey Street bridge, for example, necessitated the destruction of about 400 tenements, housing perhaps 10,000 people. On the other hand, the growth of population has never been so great. Immigration, especially from the countries which chiefly people the lower East Side, has been the largest ever known. As there has been no proportionate increase in building, the Hebrew population, in the last three years, has spread over nearly the whole city. In that period at least 30,000 have left the lower East Side and established a new Ghetto in Harlem. About the same number have settled in the Twenty-sixth Ward of Brooklyn. In the Bronx a new tenement section, composed entirely of Russian and Polish Jews, has grown up in the territory between Crotona and Claremont Parks. It numbers about 25,000. There is hardly any part of the city, indeed, in which settlements of Russian and Polish Jews will not be found. And wherever they have gone rents have advanced. The demand for accommodations, that is, has been much greater than the supply.

The true explanation of this unfortunate rent increase, therefore, must be found in the causes underlying the cessation of tenement building. This is accounted for in several ways. During the past year the mortgage loan market has been unfavorable, though building operations in tenements have not been hampered from this cause as much as the larger and more hazardous class of undertakings. The high price of building materials has also stood in the way. Probably the greatest deterrent, however, is the demoralized state of the building trades. The extortions of the unions and the contractors, the combinations which have been made against investors in buildings, the high wages, and the incessant strikes, have paralyzed what, without these untoward influences, would now be a most flourishing industry. The increase in wages is especially significant. Thus, in 1897 the prevailing rate for bricklayers was $4. They now receive from $5 to $5.50. Plasterers then got $4; they now get $5. Carpenters six years ago were eager for employment at $3.50 a day; the rate at present is $4.50. And so all along the line.

No rational objection to these increases could be raised were they entirely economic. But in many cases they are the result of what are little less than conspiracies between the unions and the contractors. They are accompanied not by greater, but by less, efficiency among the workmen. Builders have been obliged to hire more men than they needed, and to submit to constant loafing. More disastrous still have been the incessant strikes. These are so frequent, on both a large and a small scale, that no builder begins an operation with any assurance of finishing it. Most building is speculative, carried on with borrowed money. Strikes mean large losses in interest, and, by preventing completion of the building in time, may cause great losses in rent. Last year's lockout, lasting nearly six months, not only prevented the beginning of hundreds of new structures which would now have been ready for occupancy, but prejudiced the whole investing public against the building business. As a result, the present real estate situation is extraordinary. Property never earned greater returns, and the demand for housing was never so unsatisfied, and yet practically nothing is done to meet this public need. Hitherto the builders could always be relied upon to keep ahead of the public requirements, but that old tradition is now upset.

Hence one of the humors of the East Side situation is the indignation of the labor unions. The labor leaders are foremost in denouncing the landlords, and have already planned several meetings of protest. The landlords, however, are simply taking advantage of an existing scarcity to put up prices. According to prevalent business standards, they cannot be blamed. Nor can all the wrath of police justices, rabbis, labor leaders, and ward politicians help the matter. In times of famine the prices of provisions go up. We have now what is little less than a house famine, and naturally rents are increased. If the labor unions, instead of denouncing property owners for conditions for which they themselves are largely responsible, will go quietly to work and end the present reign of terror in the building trades, construction will be resumed on a large scale. Then, and then only, will rents be reduced to a lower level.

ANOTHER THEOLOGICAL FLURRY.

Canon Henson of Westminster bids fair, by his *Contemporary* article on "The Future of the Bible," to stir up the pure minds of theologians to as great a zeal against heresy as Canon Farrar did twenty years or more ago. The latter struck mainly at the stark doctrine of endless punishment; but Canon Henson is for throwing overboard the whole baggage of miracle. What he calls the "prodigies" of the Old Testament he would have the clergy cease to read in the churches as though they were longer to be taken as historical; and he intimates that criticism is compelling the abandonment of much of the supernatural element in the New Testament as well. Of course, there is already a vast outcry about all this. Resolutions and petitions are pouring in upon Canon Henson's ecclesiastical superiors. The demand is that the heretic be burned—that is, of course, only in the comfortable modern fashion: dismissed from his living with tears, and asked cordially to dinner afterwards.

Such a flurry, like Professor Bowne's recent trial for heresy, has necessarily the air of being an anachronism. A sense of unreality seems to attach to all concerned. Canon Henson, on his part,

is impelled to extreme statements; his opponents, on the other hand, are driven to reactionary utterances which do not express their own real thought. This is one of the points made in Mr. Henson's article. He says that one of the results of the new light cast upon the Bible is to frighten "many of the best of Christian men," and lead them to "take their place in the ranks of obscurantism and exert their whole influence on the side of authority." Just as Pusey and Newman took alarm at German Biblical criticism, and fled to mediævalism for refuge, so to-day where the free study of the Scriptures is making one heretic, it makes two bigots. It is something more than a coincidence that, at the very moment of this excitement in England over the doctrine of inspiration, we in this country should be witnessing the formation of a league of clergymen to uphold the tenet of the verbal inspiration of the entire Bible, whether men will hear or forbear. It almost seems a case for Matthew Arnold's gentle sarcasm at the expense of good men a little too anxious to "do something" to aid the Creator.

In all such controversies it is necessary to bear in mind the difference between what men think and what they say in public. Most educated men think alike about these questions—that is, when they converse together privately and in confidence. The enlightened men in the ministry are few to-day who would not admit that miracles are a burden upon Christian belief, rather than, as they used to be considered, its great proof and bulwark. The spirit of the age does its work even upon the most refractory. Paley and Butler are not quoted to-day in the pulpit as often as Drummond and Benjamin Kidd. The emphasis has insensibly changed. Thought runs in different channels. Every one who has the privilege of frank talk with the younger clergymen knows how the thing has gone. The miraculous means little to them, except as a difficulty to be got over by one knows not what method of accommodation and adjustment, or a purely Hegelian zest for extracting the "spiritual meaning" out of an event that never happened. This is what Sir Oliver Lodge has in mind when he calls for a revised statement of the Christian creed. He desires a theological symbol that would come somewhere near expressing the actual beliefs of Christians, instead of those doctrines which they accept only in a forced and non-natural sense, and by torturing them out of their obvious meaning.

We mean nothing invidious to theological controversialists when we say that their utterances in synods and church congresses do not always represent their real thought. The same thing is true of others—politicians, for example. There is a certain conventional doctrine of party or creed which simply has to be asserted publicly. But just as we are in the habit of discounting political oratory, so we wisely will clerical. When a heresy-hunt is afoot, many of those who join in the chase know in their hearts that their place is with the hunted. Canon Henson will doubtless be the subject of pained rebuke by many who privately think much as he does—though, of course, they do not think that he is wise in blurting it out. We speak only by way of caution, and out of abundant charity. It must not be imagined that all who appear to shut their eyes to the light really do so. In these matters we should bear in mind the distinction which Garrick made when he said to Coleman, who protested he could eat no more of a dainty of which he was very fond, "But could you not if you was in a dark closet all by yourself?"

In one of Canon Henson's contentions we confess to seeing but little force. He would have the miraculous stories of the Old Testament omitted from public reading of the Bible, on the ground that they pervert the minds of them that hear. But he ought to take comfort from Tennyson's Yorkshire Farmer. The majority of church-goers, like that good man, pay small attention to the substance of what is read to them in church. They think the minister knows his business. The words about Biblical wonders have a pious sound; they carry with them rich and dear associations; and that is enough. It is a purely clerical fear that Scripture reading from the pulpit produces higher critics in the pews. One can understand how a clergyman might inwardly writhe at the passages he is compelled to read as if he believed them literal truth; but it is not necessary for him to suppose that his hearers share that peculiar anguish. It is, indeed, primarily for the sake of the ministry itself that a closer connection should be sought between the profession of the mouth and the belief of the heart. It is in the minds and consciences of clergymen that all these questions are most acutely harassing; and it is for them to find some means of harmonizing the new truth with the old emotion and morality.

THE AMERICAN ORIENTAL SOCIETY.

WASHINGTON, April 9, 1904.

Easter week is not the most favorable time for meeting in Washington. Especially this year, when, in addition to the crowds assembled to see the races, the four hundred representatives of the Publishers' Association filled the hotels, a certain confusion was unavoidable. The Orientalists who spent the first hours of the one hundred and sixteenth meeting in vain search for a hotel of hospitable disposition were, however, of a philosophic temperament, and the slight initial annoyance was soon dissipated by other pleasanter circumstances—the thoughtful care of the local committee, the kindness of the Cosmos Club, whose doors were opened wide to receive the Society, and not least by the springlike weather, the fresh verdure and blossoming magnolias of the grounds about the United States National Museum, where the Society held its meetings.

The number of papers read was, as usual, difficult to harmonize with the scanty time allowed by a session of two days and a half. A new rule seemed imperative, and was adopted, in accordance wherewith only those papers were presented the writers of which were on hand to read them. This rule cut out papers enough to give some leeway to the members actually presenting (instead of merely sending) their notes and essays. The communications fell into several divisions, the Aryan and Semitic folds being enlarged or added to by the new interest in comparative religion and in Tagálog, Bisáyan, etc. The technical papers ranged from observations on the Greek name of the last native King of Babylon by Professor Moore of Harvard—who showed that Nabonnedos, and not Nabonidus, is the old form (the latter being a corruption)—to the form of letters in the Philippine alphabet, by a new member, Mr. Wolfenson of Johns Hopkins.

In connection with the subject of the Philippines, it is interesting to note that the Society has just received as another new member an officer of the United States army, Lieut. MacKinlay, who offered as his first paper before the Society a dissertation on some of the minor languages of Luzon—the valuable result, not of compilation from the writings of others, but of personal contact with the natives. It is to be hoped that this example will be followed by others, and that the excellent opportunities for studying Philippine dialects will be utilized by our officers. In course of time we may have (as was observed on the presentation of Lieut. MacKinlay's paper) as illustrious combinations of soldier and scholar as are exhibited by Rawlinson and other English military savants.

The more general papers on comparative religion were mainly on more familiar ground. Professor Toy discussed recent views of totemism, criticising chiefly the theories of Frazer and Lang, and Miss Morris gave a careful study of the influence of war and agriculture upon the religion of the Kyans and Sea Dyaks; but in the other communications of this division the speakers confined themselves to the Semitic field. Syrian and Arabic survivals of surrender of personality to deity, by Professor Curtiss; a discussion by Dr. Foote of the connection between the Cherubim and Ark, together with renderings of the poetic form of Ecclesiastes by Professor Haupt, came under this head; while in the same division fell the two Babylonian papers by Dr. Ward and Professor Jastrow, respectively, the former scholar giving a drawing of a god interpreted as Nergal (in Chaldæan art), and the latter offering a fresh explanation of the nature of Ninib, as a form representing an intermediate stage between Bel and Marduk, and drawing to himself the characteristics of other gods. Professor Lyon remarked on this that the chief god of a tribe can scarcely be said to be a mere sun or storm god, but he is, as chief,

a god of various functions. The question whether religion can be regarded as universal formed the subject of a paper by Professor Hopkins.

The session for the series of papers just mentioned was inaugurated with an informal luncheon and *conversazione*, at which were present as invited guests of President Gilman not only the members of the Society, but also the ambassadors of Japan and China, and several distinguished scholars. At this special meeting informal talk was in order, a generous relief to those jaded with three preceding sessions of formal dissertations. Some of the new members gave accounts of Oriental travel undertaken in the last year. Professor Walcott spoke of the investigations carried on under the auspices of the Carnegie Institution, and the survey of the Pacific yet to be carried out; Dr. Crosby discussed the results of his expeditions to Abyssinia and Tibet, and Mr. Fairchild gave glimpses of life as he found it along the Euphrates. Prof. Max Müller told modestly of what he hoped to do in Egypt in the course of his projected excavations, and Professor Jackson exhibited photographs taken on his recent trip to Persia. This feature of the annual meeting has proved so attractive that it will not easily be allowed to drop. Indeed, one enthusiast suggested that in future all formal papers should be read simply by title, and that the Society devote itself simply to conversation and good fellowship.

Of the other papers, Hammurabi's code was discussed by Professor Lyon, who argued that the law previous to the time of this ruler had been worded in the language of the learned, and that Hammurabi converted it from a Sumerian into a Semitic (and more accessible) form. The Ginsburg edition of the Hebrew Bible was criticised by Professor Moore, who showed that it was far from being as perfect as it had been proclaimed to be. Professor Lanman gave an account of the Harvard Oriental Series, and exhibited advance sheets of the works hereafter to be published therein. The discussion of the term Yâwân (as a designation of the Greek empire of Alexander) by Prof. Torrey proved interesting to both Semitic and Aryan scholars, since the equivalent Yâvana in India also designated the same empire. Professor Torrey showed that in Daniel and First Maccabees the expression Hellas was an equivalent of this imperial (not geographical) Hellenic country. Of specially Aryan contributions there happened to be few at this meeting. Professor Jackson gave an account of the Sanskrit drama "Priyadarsikâ," and Dr. Gray contributed a sheaf of papers on Indo-Iranic literature and history, while Miss Grieve sent from India some folk-stories of Ramdas, and Dr. Abbott, also of India, told of his discovery of a new Kashmiran Sanskrit alphabet. From St. Petersburg came also a bibliography of later Sanskrit dramatists by Dr. Schuyler.

A paper on the amplificative plural in Assyrian by Mr. Ember differed from many of the technical communications in being intelligible to most of the audience. Mr. Ember claimed that the plural of majesty was the sole cause of the form Elohim, and that this term did not conceal an historical antecedent of polytheism. This he illustrated by the use of the words "by the rivers of Babylon," *i. e.*, "by the great river" (Euphrates). Dr. Foote's paper on the Ark and Cherubim raised the question whether there was any genetic connection between the Assyrian winged bulls and the Cherubim, and answered the question negatively. In the remarks that followed, it was clear, however, that he had not convinced all the Babylonian scholars present.

This sketch of a few of the five and fifty papers offered to the Society will give a general idea of the character of the meeting; for many interesting papers of more technical character the reader must be referred to the pages of the Journal of the Society.

The meeting was not without other features. The venerable Dr. Boehtlingk, the Nestor of Sanskrit scholars, this year completed the sixtieth year of his membership in the Society—an extraordinary record, duly recognized by the members, who sent the aged scholar a message of affectionate regard. The meeting was honored by the presence of Professor Delbrück, the leading syntactical scholar of the world, who came to Washington to attend the meeting. He has been for many years an honorary member of the Society.

At the hospitable invitation of the local Biblical Club, the Society at its last session adjourned to meet in Easter week next year at Springfield, Mass.

Correspondence.

A STUDY IN OPTIMISM.

To the Editor of The Nation:

Sir: A monthly magazine, which gives in its opening pages a review of "the progress of the world" furnishes, in the issue of this particular month, an interesting series of examples of that light-hearted content with things as they are which makes for profitable journalism.

The review opens with an account of the Supreme Court decision in the Northern Securities case. The chief lesson of this is one of gratitude to President Roosevelt for enforcing the law, coupled with congratulations for Justice Day because, "although a close personal friend of Mr. McKinley, and also of Mr. Hanna," he joined with the majority of the court. Incidentally, the railroad officials are cheered by the expression of a hope that the "very proper" Foraker amendment to the Sherman Act, exempting railroads from its operation, will soon be passed.

Another theme for gratitude is found in the safe establishment and recognition of the Panama Republic, together with the brilliant speech of Mr. Elihu Root at Chicago in defence of the Administration, the oblivion which we are told has overtaken the calumnious defamers of the President, and the triumph over partisanship which led half the Democratic Senators to vote for the ratification of the treaty.

The postal frauds next claim attention, but the moral of this review of the situation is that Congress is a body of men of "remarkable probity," and that we should deprecate the inconsiderate action of the new Postmaster-General in associating the names of Representatives with criminal conduct, in presenting "a trivial mass of information," especially at the awkward moment when renominations are impending! The tone of this passage reminds one irresistibly of the attitude of Horace Walpole toward one who had disturbed social serenity by some breach of good form.

A paragraph on the election scandal in Denver admits a "fearfully depraved condition" in Colorado politics, but has for its conclusion that such disclosures should not dishearten us, since the very fact that they are made "is a sign of health and vigor in the body politic."

Time fails me to note in detail how the editor extracts cheering reflections of the same character from the Smoot investigation, the "disability" pension order of the wholly "practical" Commissioner Ware, and from the prophetically visioned beneficence of our growing navy for Panama as for the Philippines; how we are warned not to think ill of St. Louis because of her reputed municipal misdeeds; and how we are to be hugely satisfied with the Hague award in the Venezuelan case, particularly with the fact that the United States was charged with its enforcement—a charge which Secretary Hay has since repudiated.

This is a review of the progress of a single month, truly notable for its spirit of childlike cheerfulness. Could Pope have held more convincingly that "whatever is is right"? To this editor not only do the clouds have silver linings, but the lining covers both sides. But stay: there is a limit to his optimism. Reformers, protestants, troublesome minorities—these are the only persons not covered by the mantle of his charity and hopefulness. We have seen that his only censure this month is for the conduct of Mr. Bristow in hurting the feelings of Congressmen; in another paragraph the members of the Philippine Independence Committee are implicitly excluded from the "sane and judicious" part of our countrymen; and it was in the same impartial review, a month or two since, that the opposition of the press to the "Panama project" as arranged by the President was alleged to be chiefly due to illicit friendship for the transcontinental railways. Would it not be more consistent for the editor to stretch his optimism one point further, and admit some compensating good in the survival of a remnant of pessimism sufficient at least to serve as a foil for the spirit of national self-satisfaction which he so ably represents? A.

Stanford University, Cal., April 4, 1904.

THE SOCIOLOGISTS AND THE OPEN SHOP.

To the Editor of The Nation:

Sir: In discussing the question of the "open shop," a surprisingly great number of very intelligent men—I have in mind at the moment half a dozen such who are readers of the *Nation*—react in a curious fashion. "If," they say, "we do not somehow restrict employers, what will prevent their taking an unfair advantage of labor?" Further discussion uncovers the fact that these men readily grant that the question of the open shop is the question of equal freedom—the question whether the people, through their government, propose in fact, and not merely in theory, to see to it that the non-unionist may choose his lawful occupation with the same immunity from violence or intimidation that the unionist or other -ist enjoys. Moreover—and here is

where we begin to look askance at them—they tell us that they are neither anarchists nor revolutionists, and that they still hold that the primary function of our sort of government is to maintain social good order. In plain words, the problem for them seems to be: Given the basic postulate of the duty of Government to enforce equally the bodily safety of unionist and non-unionist, how to avoid certain inevitable but undesired consequences of the performance of this duty?

The proposal to discuss, first of all, the probability of arriving at a solution of such a problem causes an immediate collapse of interest. One is made to feel that his proposal marks him as a sort of metaphysical crank, or worse; and further discussion is clearly hopeless. Even if the charge were pat, one might still prefer to accept its consequences rather than join in the prevailing attempt to eat our equal-freedom cake and have it, too. Matter of this sort published in "Correspondence" columns accomplishes nothing. But is it not possible for you, without raising the question of the plus or minus value of that economics and that sociology which pretend to be more than merely historical, to point out more specifically than has been usual the fact that the question which the National Industrial Association raises as to the open shop is in no sense an economic question? We have said that it shall be our first governmental business to see to it that men shall choose their lawful occupations with immunity from intimidation so far as in us lies to prevent it. More and more in the past twenty years we have stood idly by talking much and doing little about the intimidation of the non-unionist. When men have protested, our more educated citizens have offered economic and sociological panaceas instead of answering a plain charge in an honest way. Surely men must see that it is no time for panaceas. The problem, the really great problem, is: Why does the great educated public fail to connect with the train of industrial conversation? Why does it fail to see that its integrity and its judgment are in question? And if the misuse of the name science seems too remote a cause, can you not at least bring out more clearly what the industrial problem really is, and put the economists and the sociologists on the defensive?—Very truly,

S. D. Merton.

St. Louis, Mo., April 7, 1904.

INTERNATIONAL AMENITIES.

To the Editor of The Nation:

Sir: The prejudice which the great English nation harbors against Germany appears in the most unexpected places. I copy the following amusing paragraph from the February number of the *Pall Mall Magazine* (pp. 284-5):

"Don't write on subjects of which you know nothing; don't, for instance, attempt to describe an American girl, or a French girl, if you have never met one. Try a German—they are less characteristic, and *any ordinary heavy sentimental type will serve your purpose.*"

I hope your many German readers will enjoy this tidbit.—Respectfully,

A German American.

Rome, March 30, 1904.

THE CRITIC AT FAULT.

To the Editor of The Nation:

Sir: Every reader of the *Nation* enjoys a scalping, and I have myself sometimes taken the tomahawk and knife in hand, and have helped to make a holiday in your columns for the members of the tribe. I feel, therefore, no disposition to cavil at the clearly phrased and easily comprehensible review of my book on 'Actual Government' in your issue for March 31. If it be true of the writer of that book, as your reviewer believes, that "he cares little about the correctness of details"; that "Mr. Hart's indifference to accuracy . . . runs through the whole book"; that he indulges in "very reckless use of language"—you are doing a public service by exposing such a pretender. True or otherwise, the author of a book reviewed by the *Nation* must always fall back upon the doctrine of the English college song,

"If God and I should disagree
On questions of theologee,
I'm damned to all eternitee.
Poor blind worm!"

It is not, therefore, to differ with the kindly reviewer, but to enforce his lesson, that I write this letter, for it appears that the vice of inaccuracy, which he considerately glosses over with the polite phrases quoted above, is more widely diffused through our country than he suspects. Your reviewer says of me:

"Any one would suppose, from his account of the nominating system (p. 91), that 'caucus' and 'primary convention' were interchangeable terms. Unless caucus and primary are distinguished, it is impossible for the student to understand that the nominating system has undergone a vast change. The present congeries of nominating conventions has taken the place of the earlier order, in which, from 1800 to 1824, Presidents and Vice-Presidents were nominated by party *caucuses* of members of Congress. The earlier system was supposed to be undemocratic, because it was not representative, and was superseded by the latter. Mr. Hart's method of dealing with the subject suppresses the history, which is essential."

This extract proves conclusively that thousands of the American people do not read the reviews of the *Nation*, and hence have contracted the fatal vice of inaccuracy, since the term "caucus" is habitually used in Massachusetts, and presumably throughout New England, for precisely the form of assembly which in other parts of the country is called "primary meeting" or "primary convention." It was so used in the Boston newspapers this morning; it is so used in Dallinger's 'Nominations for Elective Office'; in the morning mail came a postal notice to attend a "caucus" in my ward, to nominate delegates to various conventions. Governors, legislatures, and party bosses perpetuate the error to which I have unhappily given currency, and they actually suppose that they are entitled to the usage of a century.

Perhaps they might take warning if they read my book (as the reviewer has evidently been unable to do), for, upon page 95, in the course of the very discussion which he finds inaccurate, is a description of that congressional nominating "caucus" which I am accused of "suppressing." Elsewhere in the book the word "caucus" is used in the third sense of a conference of party men in a legislative body, a sense with which the reviewer is doubtless acquainted, in spite of the fact that he does not mention it; perhaps space limits compel him to state only a part of what he knows.

Questions of the various meanings of "caucus," or of the inclusion or exclusion of particular statements, are not significant in themselves; but there are ethics even of the stake—a Sioux might justly complain if expected to sing his death song in a tongue known only to his captors. The truth is, that when one undertakes to deal with the subject of American government, in a comprehensive way, one must make in cold print not less than twenty thousand statements of fact; and no knowledge, experience, care in writing or verification will prevent mistakes, some of which seem preposterous when observed in the first printed copy or pointed out by considerate friends. I have under my hand a list, many times longer than the reviewer's, of errors detected and corrected for a forthcoming second edition; and I should be glad to be informed of other mistakes. When we see a writer evidently so well qualified as the reviewer, in his half-dozen illustrations of the inaccuracy of the 'Actual Government' falling instanter into an error of his own, there seems little hope of arriving at absolute truth this side of the millennium.

Very truly yours,

Albert Bushnell Hart.

Cambridge, Mass., April 8, 1904.

[We did overlook the statement on page 95. We make the apology which is due to Professor Hart in this particular of our review.—Ed. Nation.]

VOODOOISM.

To the Editor of The Nation:

Sir: In the *Evening Post* of April 2 I find an article on "The Home of the Voodoo," in which cannibalistic practices of Haytian negroes are luridly set forth. The writer remarks that his authority, Sir Spencer St. John ('Hayti or the Black Republic,' 1884), is a trustworthy observer whose accounts have never been refuted. Had he taken pains to examine the literature of the subject, he would have found the imaginative character of these stories sufficiently expounded in the *Journal of American Folk-Lore* (April-June, 1888; January-March, 1889). The truth is, that the word Voodoo and the notions associated with the term, are not of African but of European origin. As heretics, the Waldenses, or Vaudois, obtained evil repute as sorcerers; they were therefore credited with all the orgies ascribed to witches, and the name, losing specific application, passed over into a designation of any enchanter. The dialectic form *Vaudou* came with French immigrants to Hayti and Louisiana, and, extending itself to English-speaking districts, is used to denote a negro conjurer and an imaginary negro sect.—Very truly yours,

William W. Newell.

Cambridge, Mass., April 4, 1904.

THE RHODES SCHOLARSHIPS.

To the Editor of The Nation:

Sir: The Rhodes Will prescribes as qualifications for the scholarships social influ-

ence and success in athletics. The trustees seem to have made a wise use of their discretionary power in enacting that this part of the Will should be observed only in its spirit. Social influence and success in athletics, however good in their way, are not academical qualifications. The process of ascertaining the first would be invidious as well as difficult, while of athleticism our universities already have more than enough. It appears, however, that the object of the testator was not so much academical as ethical and perhaps political. He wished to form a character with aims and principles like his own. Is it certain that such an object could be well combined with that of university education?

Apart from the distribution of the scholars among the colleges, it does not appear that any new regulations for admission at Oxford have been made—at least beyond the extension of privileges already enjoyed by the British colonies. The University has always been open to natives of all countries. A Rhodesian scholar from a Southern State may there find himself passing an examination by the side of a West Indian negro.

For a post-graduate course, if that is in contemplation, I fear Oxford is not yet equipped. She is undergoing a two-fold transition: from the state of a finishing school of culture for the gentry to that of a university as an emporium of learning and science; and from that of a confederation of colleges with a tutorial system of instruction to that of a university with a professorial system—her condition before the colleges were founded. From an expression in a letter of the Chancellor of the University I should gather that the difficulties of the transition have yet to be overcome.

For my own part, I cannot help wishing that the money had been simply left to the University for the benefit of all comers. A stipend of $1,500 a year is sure to attract candidates. But, apart from Mr. Rhodes's ethical and political designs, I fail to see clearly what object can be gained by transferring a number of promising students in the formative period of life from the universities of this continent to a social and political atmosphere different from that in which their lives are to be passed. I have seen something both of English and American universities, and my impression is that, all things taken into consideration, an American or Canadian will gain no more by being transplanted to Oxford or Cambridge than an Oxford or Cambridge man would gain by being transplanted to a university on this continent. However, the experiment will be made with care, and certainly with perfect good will on the side of Oxford, and we shall presently see the result.—Yours faithfully,

GOLDWIN SMITH.

TORONTO, April 5, 1904.

Notes.

'The First Folio of Chaucer,' to wit the first collected edition, by Thynne, in 1532, is to be reproduced photographically by the Clarendon Press. Professor Skeat will supply an introduction, and the edition will be of 1,000 copies only. To scholars this reprint will be welcome, for Thynne is the sole authority for several Chaucerian pieces; but the appeal is to the reader and bibliophile as well, since the luxury of reading Chaucer in black letter is now only for the well-to-do, and the issue of the Kelmscott folio did but set a new temptation before the aspiring collector. The present edition will be put, according to binding, at $50 and $60, or about the price of a clean copy of Speght's folio of 1602.

'Our Mountain Garden,' by Mrs. Theodore Thomas, will be published during the present month by the Macmillan Co.

The interval that has elapsed since the first publication of Samuel Parsons, jr.'s, 'Landscape Gardening' (Putnams), in 1891, and the present reissue might have been employed to better it even if it remained, what it virtually is, an essay on the treatment of lawns. But there is much good matter in the book. It is of less importance that the art of process illustration for such topics has greatly improved meanwhile.

'Burdett's Hospital and Charities, 1904' (London: The Scientific Press), is the familiar, freshly authoritative year-book of philanthropy; a mine of statistics and discussion of the economic working of the charitable institutions involved. Sir Henry Burdett speaks of the past year as a hard one for hospitals, in consequence of business conditions, but this has been met by diminishing outlay. Laying down the rule that as hospitals fulfil their function efficiently there is a lessened pressure on their beds, he makes exception in the case of paralysis, whose patients have increased at the rate of 133 per cent., and the funds for their treatment only 21 per cent., in the past nine years. Sir Henry adds that he has "pointed out the dangers and risks to the insurance offices" from the terrible strain of modern life, and adds that he "has for upwards of twenty years been himself insured against the risk of paralysis." The heightened cost of maintenance in modern hospitals is that of nursing, which is essential to rapid relief and restoration.

"The Langham Series of Art Monographs" (imported by Scribners) are companionable little books of good English manufacture, bound, at choice, in flexible boards or cloth. The general editor, Mr. Selwyn Brinton, leads off with 'Bartolozzi and his Pupils,' and promises that these little volumes shall avoid the highroads and seek the "unexpected byroads and green-shaded lanes" of art. Francesco Bartolozzi unquestionably is an artist of the by-paths. Having shown conspicuous ability in the handling of the etching needle and burin in Italy, he came to Pitt's England and stippled the prettiness of Angelica Kauffmann and others in a fashion that ravished all men of feeling then, and still allures the gentler sort of amateurs. His English adventures and popularity were practically a great refusal of enduring achievements as an artist. His plates are stippled not with steel, but with sugar, and only an occasional superb rendering in line suggests even the great craftsman that had gone. Such hard sayings the reader will not find in Mr. Brinton's book. He writes as an enthusiast, and almost prevails by presenting, in reproduction, the early plates rather than the characteristic ones. He adds a select catalogue of three hundred prints, so that his essay will be of practical value to the novice. The work is intelligently done, and at first hand. There is really nothing to cavil at except a lack of critical attitude.

Mr. Edward F. Strange's 'The Color Prints of Japan' is of better fibre. He meets frankly at the outset the contempt of Japanese connoisseurs for the wood-cut designers, asserting boldly that we Occidentals, being free from certain Japanese idola, are really the better judges. In this connection it should be noted that Dürer drew his illustrations and Rembrandt pulled his prints not for the cultured, but for the vulgar. Good sense characterizes Mr. Strange's little treatise throughout, though naturally it is a cruel business to dispatch some forty draughtsmen in about twice as many 16mo pages. But generally he has kept an even course, allotting space and emphasis with judicial amenity. As to signatures, we could wish that more had been reproduced, and both this book and the foregoing should have been provided with an index.

An ideal handbook of rugs would contain concise information as to the materials and weave of each kind, a minimum of description of designs and colors, and an abundance of illustrations showing the chief variations of the standard patterns. In other words, a slight amplification of Mr. Mumford's textile tables, extra-illustrated by about 100 cuts, only a tithe of which need be colored, would meet every need of the frequenter of the American rug mart. Measured by this standard, Mrs. Mary Beach Langton's 'How to Know Oriental Rugs' (Appleton) falls far short of the ideal. It is deficient in such vital matters as the number of knots to the inch; it repeats the current guesses about symbolism in design without any increment of knowledge or vivacity; it fails to warn the buyer specifically against the commoner forms of rug doctoring; in fine, it is relatively useless for the quest, and dull reading at home. Of course, the twenty illustrations (twelve in color) may fairly stand to the credit side. No book of low cost has so many and, on the whole, so representative a display. The critical limitations of the writer may be judged by her cheerful acceptance of the modern silk products of the Turkish and Persian looms, and by the delightful tidbit of misinformation that Cabistan rugs are of "runner" shape because they "are claimed by some to be made for the special purpose of spreading between the graves of the relatives of the wealthy."

Messrs. Gayley and Flaherty's 'Poetry of the People, Comprising Poems Illustrative of the History and National Spirit of England, Scotland, Ireland, and America' (Ginn & Co.), justifies its title at all points save "poetry"—that is, there is a jumble of good verse and bad, as Professor Gayley admits in his preface. Nothing, for example, can be said in favor of including in a text-book, such as this is meant to be, either the John Brown song or "Tramp, tramp, tramp." They are base examples as poetry, in spite of the former furnishing one "familiar quotation," and cannot be read apart from the music. A better literary excuse can be found for "Dixie" and "My Maryland," which must be taken, we suppose, to illustrate the "history" of America, since they stand for quite the opposite of American "national spirit." Indeed, what delight shall the ingenuous Northern youth take in the line "Huzza! she [Maryland] spurns the Northern scum"?

Is it worth while to remind him of the general contempt poured by secessionists upon the white laboring population arrayed against them? This collection ranges from "Sir Patrick Spens" to "The Lost Leader," "Annie Laurie," "The Shan Van Vocht," "The Star-Spangled Banner," "Ben Bolt," "Ye Mariners of England," "The Concord Hymn," "Home, Sweet Home," and "O Captain, My Captain." It is at least convenient for reference.

Mr. L. J. Spencer of the British Museum has translated the great work on 'Precious Stones' of Dr. Max Bauer, published in 1896, and the most complete on this subject extant. The translation (London: Charles Griffin & Co.; Philadelphia: J. B. Lippincott Co.) preserves in the main the scope and plan of the original work, but some additions have been made to bring it up to date. The descriptions are clear and accurate throughout, and convey an immense amount of information, valuable for the expert as well as interesting to the general reader who may wish to learn something of the most popular branch of applied mineralogy. The volume is handsomely printed on heavy paper, and the eight colored plates, identical with those of the German edition, give a superb representation of the principal gem minerals.

The Mississippi Historical Society (Oxford) appears to have no difficulty in procuring material for its Publications. The seventh substantial volume, of 500-odd pages, has come to hand, edited by Prof. Franklin L. Riley. The civil war and Reconstruction take up a large but not excessive space, and one of the most readable papers is that by Miss Mary J. Welsh, on "Makeshifts of the War between the States," in respect of food and clothing particularly. It would seem almost by a canon of Southern rhetoric that these reminiscences end with the words: "The Southern whites and the Southern negroes are mutual friends and in a measure mutual dependents, but equals, *never!*—except before the law." And very little of that! But already, in his address of welcome to the Society at its sixth annual meeting, the Democratic leader of the House of Representatives, John Sharpe Williams, obeyed the same compulsion. The philosophy of the South's sectional history, he said, will be shown to have been ever consistent—"that unvarying purpose being this: the preservation of our racial purity and racial integrity—the supremacy in our midst of the white man's peculiar code of ethics and of the civilization growing out of it—equally peculiar." Yet he confesses that the "peculiar institution" "was not our *Cause*, though we thought so once and fought for it among other things."

In reviewing in these columns the 'Estetica' of the well-known Italian scholar, Benedetto Croce—which now comes to us in a second and revised edition—we called attention to the prominence accorded in it to the æsthetic speculations of the philosopher Vico as an early and profounder precursor of Baumgarten, the reputed founder of the science of æsthetics. Signor Croce is the chief European authority on all subjects connected with Vico's life and works, and the many minor articles and treatises which he has devoted to this subject are of high importance. He has now added to these a 'Bibliografia Vichiana' (Naples: Tessitore), an extended bibliography in three parts, presented originally to the Accademia Pontaniana of Naples. The first part contains a list of all the editions, translations, and manuscripts of Vico's works; the second, a list of all the historical and critical treatises on Vico's work and thought, with a conspectus of the various judgments on his system of philosophy; while the third contains hitherto unpublished material, such as letters to and by Vico, contemporary documents, and the like.

La Critica, by the way, the bi-monthly periodical of which Signor Croce is the editor, is now in its second year, and maintains the originality and acuteness which distinguished it from the very start. The second volume continues the series of essays on contemporary Italian literature by the editor himself, with valuable bibliographical notes. The two concluding papers are devoted to Gabriele D'Annunzio, and no more illuminating study of his resplendent but abnormal genius has yet appeared in print.

The figure of Harlequin, the conventional clown of improvised Italian comedy, reappears in the popular drama of many European nations. Dr. Otto Driesen has now attempted to discover the sources of this typical character, and in his monograph 'Der Ursprung des Harlekin: Ein kulturgeschichtliches Problem' (Berlin: Duncker) controverts the accepted opinion of an Italian origin. He finds that the Harlequin was first introduced into the *commedia dell'arte* about 1572 by an Italian comedian playing in Paris, that the character was based on an old French legendary figure, which from time immemorial had been given a semi-diabolical form, and that its original home was, therefore, not Italy, but France. The book is enriched by a score of curious illustrations and by appendices containing rare or unpublished documents illustrative of the general theme.

With the last number of the second volume (November, 1903-March, 1904), the periodical the *American Author*, edited by Mrs. M. P. Ferris for the Society of American Authors, suspends publication "for lack of financial backing."

One would hardly look in the *Journal of American Folk-Lore* for a discussion of the "Sources of Shakspere's 'Tempest.'" We therefore direct attention to Mr. W. W. Newell's paper bearing that title in the October-December number (Houghton, Mifflin & Co.). It was originally read before the Shakspere Club in Cambridge, and its pertinency in its present setting proceeds from the resemblance to be traced in a Massachusetts version of an English nursery tale, "Lady Feather Flight," to Jacob Ayrer's "Die schöne Sidea," one of the supposed sources of the "Tempest." Mr. Newell supplies an original translation of part of the German drama.

The oceanography of the North Polar Basin, with which the *Annales de Géographie* for March opens, is an extended review by Prof. M. Zimmermann of F. Nansen's third volume of the scientific results of his expedition. It closes with the remark that the work shows a logical mind eager for precision and gifted with rare constructive qualities, and exhibits the same scope that characterizes his previous path-breaking works. The editor, M. Vidal de la Blache, describes the map of France in preparation by the Service Géographique. Urban geography is cared for in an analysis of the historic and economic development of Montluçon, and colonial in an account of Tunis and its environs, the natural features, climate, water supply, products, and people. A large part of the "Chronique" is devoted to recent events in Panama, together with some facts about the canal.

A general interest attaches to the latest Bulletin of the New York Forest, Fish and Game Commission, on the "Forest Fires of 1903." The reporter is William F. Fox, Superintendent of Forests, who illustrates his text with several effective photographs both of devastation and of means of prevention and extinguishment. The locomotive engine appears as a constant danger, and it has very properly been rigged so as to constitute a pump to repress its own conflagrations, as is shown in one of the views. In the Adirondacks the estimate of standing timber alone destroyed during the year is $666,000; in the Catskills, $29,000.

A paper of unusual interest on the higher portions of the Sierra Nevada ('The Geomorphogeny of the Upper Kern Basin') has lately been written by Prof. A. C. Lawson for the Bulletin of the Department of Geology, University of California, iii., 1904, in which the share taken by the extinct glaciers of the summit region in fashioning its form is well set forth. Adjacent glaciers so far enlarged their amphitheatres by retrogressive erosion as to reduce the intervening ridges in some cases to narrow and low serrated spurs; trunk glaciers enlarged and deepened preexistent stream valleys so as to give them the trough form characteristic of glacial channels; and the branch troughs open in the sides of the main troughs as "hanging valleys." A number of excellent plates illustrate the article, and show the region described to be particularly attractive to mountain climbers who study the forms of the heights they overcome.

Atlanta University is pursuing this year an investigation into the extent and causes of crime among negroes in Georgia. The need for exact information on such matters is manifest. Mr. W. E. B. DuBois, who is in charge of the work, appeals for contributions of funds from persons interested in extending and making effective this inquiry.

—How our intervention in Panama is regarded by Latin-American opinion appears from an article in the *Revista Positivista* (Mexico) by Professor Aragón, "La Republica (!) de Panamá y la Diplomacia Contemporanea." The writer finds in our professions of tutelage over the Spanish-speaking republics only a pretext for aggrandizement on the part of a nation dominated by plutocracy, militarism, and imperialism, with a civilization, as revealed in its homicides and lynchings, resembling that of the stone age. The creation of the State of Panama was a speculators' *coup*. The revolution was purely the work of the United States, and will ultimately lead the way to an avowed protectorate. Representatives of a party which in 1860 declared every project of disunion to be abhorrent, Messrs. Roosevelt and Hay welcomed the disunion of Colombia with a promptness which will always cast a shadow upon their political records, and prevented a friendly nation

from subduing an insurrection on its own soil. Yet the United States has always posed as the defender of the weak and the oppressed. The one bright spot in the situation was the opposition manifested by the advocates of the Nicaragua route. The writer adds: "The events in Panama should furnish food for thought to the governments of the other republics. In view of the advances of Yankee imperialism, by what conduct shall they avert the danger of being devoured by the immense octopus (*pulpo*)? We must above all, with perfect good faith, sink our causes of discord, and group ourselves about our respective flags with fraternal embraces; for without union, without morality, without obedience to law, without respect for authority, without love of work, without the fixed purpose to form a nation strong and august by its virtues, we shall be the plaything of the unscrupulous ambitions of foreigners more powerful than ourselves. In a word, to preserve order in our own homes, to work for progress, and to inspire ourselves with love, will be our way of avoiding all pretext of interference on the part of those who covet the whole or a part of what we possess."

—Volume IX. of 'The Philippine Islands, 1493-1898' (Cleveland: Arthur H. Clark Co.), covering the period 1593-1597, presents no one document especially salient for its importance, but it contains twenty-seven, several of them with accompanying papers, which all contribute in greater or less degree to a better comprehension of the character of early Spanish colonial administration and to a better knowledge of the progress of conquest in the Philippine Islands. Among them are several hitherto unpublished, which are of some considerable value to the historian as well as to the general reader. The range of subjects covered includes: the progress of christianization of the natives, which was slower than most of the Spanish historians would have us believe; the never-ending controversy as to prerogatives between lay and ecclesiastical authorities, of which this volume reveals the king's evident conclusion that Gov. Dasmariñas was rather more in the right than Bishop Salazar, while the Pope showed an inclination to side with the representatives of the Church; the first steps in conquest of the Moros of Mindanao; the resultless efforts of the Spaniards to intervene to their own advantage in the war between the kings of Cambodia and Siam; the sending of friar-emissaries to the great shogun of Japan, Hideyoshi, then victorious over the Koreans and adopting a high-handed attitude towards the new European settlements in the Philippines, by which steps the Spaniards hoped both to get a better footing for missionary work in Japan, and to gain time to complete the first walls of Manila ere the supposedly threatened invasion of Japanese and Chinese might find them too weak for effective resistance; the many-sided rivalries over the rich trade with China, between Spaniards as against Portuguese, Spaniards in Mexico, Peru, and other American possessions as against those in Manila, and between the various cliques competing for that trade in Manila itself. The difficulties of reconciling the conflicting interests of his growing domains and of governing possessions on the other side of a still but partially explored earth, in the days when sailing craft furnished the only mode of communication, are well brought out in the instructions given by Philip II. in 1596 to Gov. Tello, sent out to succeed Dasmariñas, who had lost his life in an ill-judged expedition to Siam. This volume contains, besides one of the usual photographic facsimiles of the conclusion of one of its manuscripts, two representations (1683 and 1748) of the coat of arms of Manila, and a curious old map of Luzon, Formosa, and a part of the China coast made by one of the Spanish navigators and explorers then in the Philippines. He was urging the conquest of Formosa, as a stepping-stone on the way to China.

—Volume X. is made up entirely of translated transcripts from documents in the rich archives of Seville. These had not, however, entirely escaped attention before, as might be assumed; in particular, the reports from Auditor Morga, herein contained, have at least in part been made use of by Filipinos who have in recent years engaged in the friar controversy. This volume covers the years 1597-1599. In editing the account of conquest in Mindanao in 1597, a slip has been made in the location—about Lake Lánao; the region meant is evidently Lake Liguasán, up the Rio Grande de Mindanao, as it was something like half a century thereafter when Spanish explorers and Jesuits reached the "Lake Moros" particularly so called. A translation not up to the standard of the work helps create confusion here. As for the contents of the volume in general, they are mostly crimination and recrimination of the civil authorities by the ecclesiastics, and vice-versa. Sturdy old Judge Morga's statements ring true, as they usually do, and he distributes his censure impartially between both sets of representatives of Spain. Listen to Archbishop Santibañez describing Gov.-Gen. Tello: "Your Majesty . . . should picture to yourself a universal idea of all vices, placed in a lawyer. . . . He is not one of those men who accompany a vice by a virture, and among many vices follow one virtue; but he has not even an indication of a virtue." The number of friars had in 1598 crept up to about 300, including lay brothers.

—Mr. Louis Dyer read before a recent meeting of the Oxford Philological Society a paper on "Early Relations between Arcadia and Olympia." These were revolutionized as a result of the Peloponnesian war, but not until the foundation of Megalopolis, the forcible occupation of Olympia, and the celebration of Olympian games by Arcadians in 364 B. C. known as the Anolympiad. We can draw a sharp line at the Anolympiad, before which Arcadians and Eleans celebrated the Olympia as one home community; it was Arcadia and Elis against the world. Before that time Arcadians and Eleans achieved the highest standards in athletics. Pausanias catalogues 168 victors who are approximately dated. Of these, 65 came after the Anolympiad. Of the 103 earlier ones 52 came from the rest of the Greek world, 51 from Arcadia and Elis—30 Arcadians and 21 Eleans. Arcadians were more numerous, and also had the training of their many local games not open to Eleans. Eleans were excluded from the Isthmia where Arcadians competed; the Pythia and Nemea were more easily accessible from Arcadia than from Elis. No wonder the Arcadian Lycomedes boasted of his countrymen's superior sturdiness and stoutness of limb (Hellenica, VII., i., 23). Their local games were countryside events until the foundation of Megalopolis, and only prepared them to compete at Olympia, managed by the Eleans, who had a *savoir-faire* recognized in 400 B. C., when Sparta, under provocation, still kept the Eleans in charge at the Olympian games (Hellenica, III., i., 81). Before the Anolympiad, Arcadian and Elean victors showed community of taste in the choice of sculptors for portraying their victors. The leadership in taste belonged to Arcadians, who favored a group of sculptors from Sicyon just at the time when the Sicyonian treasury at Olympia was built. After the Arcadians withdrew, there was a collapse of good taste. Shoals of latter-day monuments indicate this along with a surviving habit of grouping together Arcadian and Elean victors, adhered to by Elis after Arcadians ceased to compete seriously. The victors' statues set up before the Anolympiad are a still plainer record of the close companionship of Elis and Arcadia. The same fusion shows in Thucydides's subdivision of the Pepolonnesus commented on by Pausanias, and in Pindar's VIth Olympian Ode, as well as in Elean and Arcadian coinage, and in Pausanias's unsuccessful attempts to define the boundary between Elis and Arcadia. For the most ancient times, reaching beyond even the many myths and legends into which Arcadia and Elis are inextricably interwoven as one country, we have the witness of deep-level Olympian excavations. The vast array of primitive votive offerings accumulated on the Altis implies a resort to Olympia from at least the whole of the area drained by the Alpheius and all its tributaries.

—The common representation that the late Frances Power Cobbe, whose death was cabled on April 6 (she was born in 1822), was weaned from her original evangelical belief by Theodore Parker's influence, is not correct. From 1840 to 1844 she worked her way out of orthodoxy without much outside help. In 1846 her mother died, and while slowly rallying from this dreadful blow she made acquaintance with Parker's writings, entered into correspondence with him, became one of his most valued friends, and, in England, the principal advocate and publisher of his opinions. In 1852, a severe illness having warned her of life's precarious tenure, she resolved to pass on ("like bread at sacrament") the truth of which she had become convinced, and her 'Essay on the Theory of Intuitive Morals' (1855) was the first consequence of this resolve. Its method was suggested by Kant's 'Metaphysic of Ethic.' It was written with a glow of enthusiasm which the dullest reader hardly could withstand. At the same time it was well reasoned out as a criticism upon Paley and Bentham and the elder Mill and the "celestial prudence" of the traditional doctrine of salvation. The later utilitarianism of Spencer, Sidgwick, and Leslie Stephen found her a vigorous antagonist, with perfect confidence in Martineau's ability to cope with them if she could not. 'Intuitive Morals' was a very able, noble, and heart-stirring book. Its next successor, 'Religious Duty' (1857) had much less spontaneity. In 1864 she published 'Broken Lights,' with the exception of 'The Duties of Women' (1880) her most popular book.

It was a fair review of the High, Broad, and Low Church parties in the English Church, the "attitudinarians, latitudinarians, and platitudinarians" of some kindly wag. 'Dawning Lights' soon followed, but was an inferior book. She had not waited long enough for her stream to gather head again.

—Miss Cobbe's gradual absorption in the cause of anti-vivisection was her literary ruin. Resigning her post on the *Standard* (with which she had been connected since the *Echo*, a halfpenny daily, passed into silence), because it had published a pro-vivisection article, she gave herself heart and soul and purse to the propagation of her humane ideas. These colored everything she wrote. Science at length became to her only another word for vivisection, stained with its victims' blood. Her passionate interest in this matter originated in her personal interest in dumb animals, especially in dogs. Strangely enough, it never made her doubtful of the morality of the sportsman's bloody work nor inclined her to a vegetable diet. As early as 1863 she wrote upon this subject for *Fraser's Magazine*, but in 1874 some harsh experiments excited her indignation, and, the Society for the Prevention of Cruelty to Animals seeming slack in its opposition, she united with others in forming a Society for the Protection of Animals from Vivisection. Of this she was the secretary for ten years from 1875, writing 173 larger and smaller tracts, with innumerable articles and letters. The failure of restrictive bills in Parliament only served to convince her that absolute prohibition was the sole way out. To this for the last years of her life she gave herself with tireless energy.

LESLIE STEPHEN AS A CRITIC.

English Literature and Society in the Eighteenth Century. (Ford Lectures, 1903.) By Leslie Stephen. London: Duckworth & Co.; New York: Putnams. 1904.

What were the qualities which made Leslie Stephen, towards the close of his career, the first among living English critics? 'English Literature and Society in the Eighteenth Century' supplies for any intelligent reader the answer to our question. His preëminence among the writers of his time was not due to any single talent; it was not due to his mere literary gifts, great though they were. It was due to the obvious presence, in every work which he has produced, of four qualities rare in themselves and hardly ever found in combination—sincerity, individuality, humor, and the scientific spirit.

"So far as my reading has gone," writes Leslie Stephen in the 'Science of Ethics,' which to some of us constitutes the most impressive and weightiest of all his works, "I have found only two kinds of speculation which are absolutely useless—that of the hopelessly stupid, and that of the hopelessly insincere." Of stupidity he can never have felt himself in danger, and there is not a book he has written which does not show the determination that, whatever else it should lack, it should possess the merit of sincerity. Let it be noted that sincerity includes a good deal more than the honesty of a teacher who is determined to say nothing which he does not believe to be true, and even to state on every topic which he handles the whole truth as it is seen by him. This is much, but for complete moral and intellectual sincerity something further is needed. The perfectly sincere man will instinctively aim at a certain kind of simplicity; he will not be led astray by the dictates of vanity, or even by the innocent egotism which attaches unbounded importance to a writer's own watchwords or phrases. Stephen was free at once from the conceit, and from the conceits, of your man of letters. His abhorrence of vanity and his sense of humor led him, indeed, greatly to undervalue the worth and the effect of his labors; he was a teacher who possessed far more disciples than he knew of.

"I do not believe (though again I cannot be certain even of this negative statement) that there is a single original thought in the book from beginning to end. By original, I mean, of course, a thought which has not occurred to others; though I, of course, also claim to have made every thought which I utter my own by reflection and assimilation."

These words, taken from the 'Science of Ethics,' show how little he claims for himself as a teacher of ethics.

"I hope and believe that I have said nothing original. I have certainly only been attempting to express the views which are accepted, in their general outline at least, by historians, whether of the political or literary kind."

This is his humble claim as Ford lecturer when handling a topic of which he was the acknowledged master. Humor, it may be allowed, here takes the form of gentle irony. Still, it is manifest that Stephen had no conceit of his own powers. He was preëminently a man of letters, but he did not even overrate the importance of literature. "Nations," he reminds his readers, "have got on remarkably well, and have made not only material but political and moral progress, in the periods when they have written few books, and those bad ones; and, conversely, have produced some admirable literature while they were developing some very ugly tendencies." He never dreamed that the writers of books were the modern priesthood, commissioned to supply mankind with spiritual guidance. Throughout his works are scattered memorable sentences which embody some profound truth admirably, because lucidly, expressed; but rarely, if ever, does he use what have been called sacramental terms. He never attempts to popularize a doctrine by embodying it in some expression, such as "sweetness and light," the "grand style," the "dismal science," and the like, which undoubtedly are for the moment effective, but which substitute words for argument, and, by becoming a sort of literary slang, vulgarize the ideas which they are supposed to embody.

If the power of our author's criticism is due to its sincerity, its charm arises from a quality which, for want of a better name, we may call "individuality." By whatever word this quality be called, it is nothing else than the capacity of a writer to stamp his work with the impress of his own individual character. This is an entirely different thing from egotism, and is a gift in which many powerful and interesting thinkers are deficient. Many are the men who, though endowed with much personal and much conversational charm, leave in their books no trace of the brilliancy, the sympathetic humor, or the easy play of intellect which was the delight of their friends. Readers who have felt something like personal affection for Dr. Johnson fancy that they know him from his works. This is in the main a delusion. If Boswell had never lived, is it certain that even Dr. Birkbeck Hill would have revelled in the writings of Johnson? We doubt it. We trace Johnson's character in his books, if indeed we ever read them, but we in fact read into the writings on which Johnson's fame is supposed to rest, the personal traits which have been revealed to us by Boswell. John Austin, again, delighted his friends by his exalted character, by the charm of his conversation and the wisdom of his thoughts. A passage in the Autobiography of John Mill is now the only memorial of Austin as he appeared to the circle of friends who knew and admired him. The 'Province of Jurisprudence Defined' tells us nothing of Austin but his logical power, and contains nothing but the dogmatic utterances of a logical jurist; it utterly lacks individuality. Stephen, on the other hand, is himself in every line that he has written. His 'Hours in a Library' and his 'Ford Lectures' recall at any rate the conversational charm which no one who has ever come under its influence will forget. In this matter, as in some others, he resembles Bagehot, for when Bagehot explains the mysteries either of Lombard Street or of the English Constitution, readers feel that they are not so much reading a treatise as listening to a most interesting talker. With Stephen, criticism turns into an hour in a library with the most delightful of companions.

"I will confess that the last time I read 'Clarissa Harlowe' it affected me with a kind of disgust. We wonder sometimes at the coarse nerves of our ancestors, who could see on the stage any quantity of murders, and ghosts, and miscellaneous horrors. Richardson gave me the same shock from the elaborate detail in which he tells the story of Clarissa; rubbing our noses, if I may say so, in all her agony, and squeezing the last drop of bitterness out of every incident."

Here we have acute criticism, but its interest is immensely enhanced by our keen sense of the critic's personality.

This individuality stands, of course, in the closest connection with that humor which gives a peculiar flavor to Stephen's works, and is itself bound up with his intense delight in biography. Sir George Trevelyan writes of Macaulay and his sisters that "when they were discoursing together about a work of history or biography, a bystander would have supposed that they lived in the times of which the author treated, and had a personal acquaintance with every human being who was mentioned in its pages." These words equally apply to Stephen; he was not a mere student, but he lived with the people of the past as if they had been his intimate friends or associates. He would grow warm over a slander on Hobbes in the way in which most of us are heated by a libel on a living friend; he neither forgot, nor wished to forget, that Hazlitt, eminent as he was as a critic, was from some points of view a cad.

We have seen somewhere imputed to Stephen a want of insight into character. A more curious mistake on the part of a

critic can hardly be imagined. The charm of literature was to our author the study of human beings, and he studied human nature with extraordinary acuteness. If any one wishes to test Stephen's gift for analyzing character, let him consider carefully the various passages in the Ford Lectures where reference is made to Pope. Nowhere do we get anything like so fair an estimate of the greatest of English satirists. We have brought before us, on the one hand, the absurdity of the notion adopted by Pope and accepted by his age, that "Homer was in the sphere of poetry what Lycurgus was supposed to be in the field of legislation," and "had at a single bound created poetry and made it a vehicle of philosophy, politics, and ethics." But, on the other hand, we are not suffered to forget that

"Pope manages to be really impressive, and to utter sentiments which really ennobled the deist creed—the aversion to narrow superstition, to the bigotry which 'dealt damnation round the land,' and the conviction that the true religion must correspond to a cosmopolitan humanity. I remember hearing Carlyle quote with admiration the 'Universal Prayer':

> " 'Father of all, in every age,
> In every clime adored,
> By saint, by savage, and by sage,
> Jehovah, Jove, or Lord,'

and it is the worthy utterance of one good legacy which the deist bequeathed to posterity."

Sincerity, individuality, a sense of humor, are, in Stephen, combined with the scientific spirit. He never for a moment forgets, or lets his readers forget, that, while every man is a distinct individual, marked by traits peculiar to himself, yet every man, however eminent, is influenced by the spirit of his time. To perceive this general truth and to accept it, is nothing; there is no one who now does not know that every one is in a sense the creature of his age. But vague generalizations of this kind are in themselves excessively worthless and often excessively delusive. No one proclaimed the platitudes or truisms of so-called scientific history in more sounding language than Buckle, but no writer of any eminence ever threw less light on the relation between men's character and the circumstances of their age. Stephen has no tremendous laws of progress to announce; he entertains no great belief in wide generalizations; but in the Ford Lectures, as in most of his writings, he insists again and again upon the consideration that

"the philosophy of an age is in itself determined to a very great extent by the social position. It gives the solutions of the problems forced upon the reasoner by the practical conditions of his time. To understand why certain ideas become current, we have to consider not merely the ostensible logic, but all the motives which led men to investigate the most pressing difficulties suggested by the social development."

But he does much more than enounce this principle: he traces out its actual working as exhibited in the literature of the eighteenth century. Take, as one example of this extraordinary capacity for blending philosophy with the history of literature, the account given of the "Wits" and their influence. We seem at first to be hearing a series of anecdotes or epigrams about the leading writers of a brilliant age, but we are made gradually to see that all the men of that age, however different their talents and their opinions, held in common a belief in the supremacy of common sense. This faith was shared by Locke, by Berkeley, by Pope, by Addison, by Steele, and by Swift; it marked a revolution in the opinions of educated men, and separates the eighteenth from the sixteenth and seventeenth centuries.

"Politically, the change means toleration, for it is assumed that the vulgar can judge for themselves; intellectually, it means rationalism, that is, an appeal to the reason common to all men; and in literature it means the hatred of pedantry and the acceptance of such literary forms as are thoroughly congenial and intelligible to the common sense of the new audience. The hatred of the pedantic is the characteristic sentiment of the time."

And this state of things gave predominance to the "Wits," who were "scholars and gentlemen, with rather more of the gentlemen than the scholars," who lived in London and formed a kind of island of illumination amid the surrounding darkness of the agricultural country, who met at coffee-houses in a kind of "tacit confederation of clubs to compare notes and form the whole public opinion of the day."

But to detach our author's philosophic ideas from the epigrams, the anecdotes, and the quotations by which they are illustrated, is of necessity to spoil them, for his possession of the scientific spirit is manifested not by the enunciation of abstract principles, but by showing every reader how in fact the general ideas of an age, whether sought for in the lives, in the conversation, or in the writings of actual men and women, blend with and govern its literature. The true answer, in short, to the question with which this article opens is, that Leslie Stephen was the most eminent critic of his time because he was much more than a mere critic; he was at once a man of letters, a biographer, and a truth-loving and subtle thinker.

SAMUEL CHAPMAN ARMSTRONG.

Samuel Chapman Armstrong. By Edith Armstrong Talbot. Doubleday, Page & Co. 1904.

General Armstrong wrote in certain "Memoranda" of December 31, 1890, three years before his death: "I wish no biography of myself made. Good friends might get up a pretty good story, but it would not be the whole truth." His wish has been faithfully disregarded. His daughter appeals from that to his habitual appreciation of the value of any simple and sincere story of a useful life. We have such a story here; if not "the whole truth," enough for our rebuke and instruction in righteousness, without any filial exaggeration, with little revelation of its subject's private life or of the traits which endeared him to his domestic circle, with the exception of his humorous hilarity. With this he was as well furnished as Garrison or Lincoln, his two great allies in the redemption of the American negro. A fourth with these is Mr. Washington, who in popular estimation overtops Gen. Armstrong; yet but for Gen. Armstrong's work it is probable that we should never have heard of the founder of Tuskegee.

It is easy to conceive that an ethical psychologist quite indifferent to Gen. Armstrong's philanthropic work might find the course of his development an interesting study, so little was there in the boy that was fatherly to the man, so slow was he in coming to himself, so dominant was his gayety in his first experience of war, so accidental was his entrance on the work that soon enlisted all the energy of his eager and intrepid soul. The father was a missionary in politics in the Hawaiian Islands, overflowing with energy and enthusiasm, and exerting a great influence. He did not deceive himself as to the reality of the Hawaiian convert's religion. "The heathen saint," he said, "is about equal to your New England sinner." Mrs. Talbot's first chapter is a vivid reproduction of the Hawaiian life, in which her father was immersed till he was twenty-one. It was a very happy life for him when he was out of bounds or travelling with his father on his missionary rounds. A good deal must have passed over from it into his ultimate work. It is frankly confessed that the missionaries generally regarded the Hawaiians much as the Southerners did their slaves, but the boy's friendly contact with them made him more sympathetic with the freedmen when he was thrown into their company, and he inherited his father's conviction that there was no color line in souls.

The father's death in 1860 did not prevent young Armstrong's going to Williams College, as he had before intended, nor did it long repress his customary cheerfulness. Quite shocking to his mother's ideas of propriety must have been his unconventional style of consolation. At Williams he "shocked people by his levity and irreverence." "Missionary or pirate," he declared to be his alternative; and the expectation of his college mates leaned to the less exalted horn. But to Dr. Hopkins's demand upon his higher nature he could not but respond. Giving up all thought of the ministry, he entered on a more genuine religious life. His brief college course terminated with his graduation in 1862; not earlier only because he now, and for a long time after, considered himself an Hawaiian citizen. But the drift of his friends into the army was too strong for his sympathetic disposition. Ignorant of tactics, he raised a company in Troy and received a captaincy. The most striking characteristic of his earlier service was its moral indifference. Army life meant for him little more than a good time. The fortunes of his regiment conspired to this effect. It was long in getting into action, and it was ingloriously bagged at Harper's Ferry and sent to Chicago on parole. Later, at Gettysburg, he was in the thickest of the fight, and his letter about it to his mother overflows with the sincere joy of battle. He was a strict disciplinarian, and at first his men "hated [him] worse than Satan." After their common baptism of fire and their assurance of his splendid courage, he could write: "You cannot imagine the beauty and the pleasure of the relation in which I now stand to this regiment."

In November, 1864, he was made colonel of the Eighth United States Colored Troops, then stationed in front of Richmond. The progress of his mind to this event is the most interesting part of his biography. The prospect of the Emancipation proclamation stirred his heart: "Then we shall be fighting for a principle." His first impression of negro character was from the negro servants in his regiment, and he thought them "worse than Kanakas." He was soon for

abolition, "more on account of their souls than their bodies." He was much impressed by his talk with a rebel general:

"The general said he thought it was more reasonable to fight, as I was doing, for a principle than to fight merely to restore a Union which was only a compact and to which they were not practically bound when they considered the other side had violated the agreement. The truth is, I partially agreed with him. The Union is to me little or nothing. I see no great principle necessarily involved in it. I see only the 4,000,000 slaves, and for and with them I fight."

Before taking the colonelcy of a colored regiment, he had seen colored troops subjected to "a hellish fire" and had written, "No men were ever braver than the slaves of Maryland." With Lee's surrender came a feeling of sadness, "a feeling that the colored soldiers [of his own command] had not done enough; had not been sufficiently proved." Sent with his regiment to Texas to assist in the overthrow of Maximilian, in the Gulf of Mexico he enjoyed a vision of his future work in much the fashion which it finally assumed. But he had not settled down upon his ultimate foundation. Business tempted him, and he joined the crowd that besieged President Johnson begging for office. Perhaps there never was a complete "wholeness of tissue" in his character. It is certainly instructive to find him, when he had got fairly at work, naïvely pleased that "everybody calls me General." Applying to Gen. Howard for a position in the Freedman's Bureau, he was first turned away and then saved for his life-work by the merest chance, being made at once an agent of the Bureau for ten counties and Bureau Superintendent of Schools over a wide area. The building up of industrial schools was from the start part of his hope and plan. Believing heartily in the Bureau, he was, nevertheless, quick to see the defects of its operation. He welcomed negro suffrage, and held fast his faith in it through all the discouragements of the Reconstruction period, and wrote in 1887, "After all, being a citizen and a voter has more than anything else made the Negro a man." It was his salary from the Bureau that enabled him to begin the work at Hampton, to resist the temptation to a Congressional career, and to get along without a coveted assessorship of Virginia taxes.

Chapter VI., "The Beginnings at Hampton," is a clear presentation of Gen. Armstrong's methods and ideals in his inauguration of the work which made for him a place among the great philanthropists. From the start he understood perfectly that the methods of industrial education which had failed at Wellesley and Oberlin were not to be revived. For many years the intellectual advantages at Hampton attracted more than the manual training. The colored people distrusted a form of education which approved itself to many North and South as effective in the creation of a colored labor caste. But what drew Gen. Armstrong to industrial methods was their ideal elements, "labor as a moral force," "hard work done for the sake of the product and rewarded by the satisfaction of accomplishment"—a very different conception from that of technical training as at once the course and end. Very inspiring is the story of his struggles, his oppositions, and his victories. His Hampton singers were his Amphion's lute, and to their music the walls of his great buildings rose on the shore so rich in historic associations. Much of his energy went to the raising of money for his work, and his speeches in advocacy of its claims had the impetuosity of his attack at Gettysburg. One dream he never realized—that of bringing the whites and blacks together in a common scheme of education. The introduction of Indians at Hampton was purely accidental. In the event it proved remarkably successful, and a telling practical rejoinder to the à-priori theorist so ignorantly confident as to what the Indian cannot do. An interesting reflection on Gen. Armstrong's experience in raising money was his persuasion that the times, good or bad, made little difference.

No chapter of this biography is more pertinent to our present burdens and anxieties than one dealing in a general manner with "The Negro and the South." Gen. Armstrong was profoundly sympathetic with the Southern white people. Their tampering with the colored vote impressed him as more dangerous for them than for the blacks. His optimism was more cheerful than it would be were he living now. The ten years since his death have witnessed a sad increase of anti-negro race prejudice, especially in the Northern States. Yet the answers to a series of questions recently sent out by Mr. Washington are convincing that the cause of negro education is not suffering from any general lack of confidence, whatever noisy opposition there may be to it, here and there. It should be mentioned that it was the *form* of the Blair Bill that made it objectionable to Gen. Armstrong, and not its essential principle of national aid to Southern education.

This review would be grossly inadequate if it failed to mention the profoundly religious spirit in which he carried on his work. But this spirit was distinctly individual. Nominally orthodox, Gen. Armstrong lived in cordial sympathy with liberal religionists, and looked to them preëminently for the sinews of his holy war. To know the negro as he knew him was to believe in him, and the more we have of his enthusiasm, tempered with his wholesome common sense, the more effectively shall we resolve the problems which are now pressing on the public mind.

Fifteen Years among the Top-Knots. By L. H. Underwood, M.D. New York: American Tract Society.

This book makes plain the fact that there is no country on earth in which hats and hair mean so much as in Korea. Each has a language of its own. By glancing at a man's headgear one may at once interpret his political position and appraise his social value. As for his hair, the way in which it is plaited or rolled gives sure index to his place or importance, and even measures both the quality and quantity of his utterances. Until a man is married he wears his hair in a braid down his back, and is not expected to talk in the presence of those who, either from age or from marital dignity, are his superiors. When a "boy" gets him a wife, he thereby becomes a man. Then he twists his long hair into what looks like a door-knob or a roll of navy tobacco, and the coil serves a variety of useful purposes. It is a most convenient handle for the policeman when subordination or capture is necessary, while in the hands of a discerning wife it is an instrument of unlimited possibilities. Among the higher classes, the top-knot is duly protected by various bird-cage-like structures of horsehair, over which goes the hat, which, besides being of varied shape and material, attains a weight and occupies an area that appear to us preposterous. Mrs. Underwood, the wife of the accomplished linguist, translator, and missionary, Dr. Horace Underwood, thus pictures critically the Koreans of the sterner sex, who heap their hair on their scalp; for, in the land of white clothes, the women dress their hair very plainly, massing it in a roll which lies at the back of the neck. The general costume of both sexes is white. Perhaps in no country does the process of starching yield more pleasing results, for the gloss attained by long beating with little poles like small Indian clubs makes the white, pink, and green clothes glisten to a most remarkable degree. Indeed, the contrast between them and the mud and the general unpaved condition of things in the Korean cities is one of the many striking features of a country which, despite the monotony of life and the poverty of the great majority, presents many oddities.

Mrs. Underwood is the first to give a woman's view of things in Korea. She went out as a medical missionary and unmarried. Changing her name, she decided to take her bridal trip in northern Korea, which, indeed, her husband had previously visited. Yet against her proposed enterprise she was unanimously warned by native and foreigner. Despite all the dangers duly catalogued in advance, and though handicapped by rheumatism, she made her way in the rude sedan chair of the country, which, with a woman's wit and art, she transformed into a comfortable vehicle. Real dangers from rude villagers and ruffians, both official and non-official, drunken and sober, were met and overcome by tact and courage. The travellers were able to reach the Yalu River, and, to Mrs. Underwood's joy, a boat ride in which they could compare Chinese and Korean civilization, was undertaken. The contrasts were striking. On the eastern side men in dingy white, who lived in thatched huts of mud and wattle, scratched the fields with an iron-shod pole drawn by oxen; the trees around them being mostly of pine, and the physical features showing a life and origin different from those on the western side. This was Korea. On the Mantchurian side were oaks and deciduous trees. Houses of brick or stone and roofed with tile, farmers in blue and ploughing with horses, showed a land of industry and thrift. The Chinese, whatever their faults, are industrious, and live in a land where property is protected and incentives to work are many. The Korean toiler, crushed by ages of oppression, cannot be certain for a moment of his wages or accumulation, for Korea is the country in which the gentleman, so called, is the parasite of society, living on the sweat and blood of the taxpayer and worker.

During Mrs. Underwood's fifteen years in Korea, many journeys were undertaken, medicines dispensed, and the healing of the sick carried on, while her husband organized churches, looked after his flock, and developed in his people not only a new world of ideas, but also the noblest of economic virtues, self-support. Her book is a real contribution to our knowledge of hygiene, or rather the lack of it, in

Korea, for we have the conditions of the average native set before us in a vivid and realistic way. It matters not upon what side we look, we discern everywhere the widespread and profound bureaucratic corruption that reigns in a country which still supports a large mass of real or expectant office-holders in idleness. This was shown especially in the time of the cholera invasion, when the Americans alone faced the foe with their quarantine, their personal care of the sick, and their distribution of the relief fund; the Government officials having the persistent habit of "eating" the money which ought to have gone for the sick. The Koreans call the cholera "the rat disease," believing that the cramps are rats gnawing and crawling inside the legs, going up till the heart is reached. Their method of prevention and cure was to offer prayers to the spirit of the cat, to hang a paper cat on the house door, and to rub their cramps with a cat skin. Some of the affected districts were almost impassable on account of ropes, about five feet high, stretched across the streets to which paper prayers were attached.

Besides noticing a thousand things interesting to the student of Korean life, this narrative gives the best statement from intimate inside knowledge of the situation in the palace and in Seul when Queen Min was murdered by Japanese ruffians. The King fled to the Russian legation for a year's stay, and Japan's prestige in Korea was for the time destroyed. Mrs. Underwood was the Queen's physician, and speaks of her in high admiration. For a long time the King was so fearful of being poisoned that he would eat only the food cooked by the American missionaries, who in some cases had to act as the royal bodyguard, largely because the King (since become "Emperor") would not, literally, let go their hands while in pitiful, though well-grounded, fear of personal violence. There may be two opinions, possibly, about the wisdom and propriety of American teachers of religion thus assuming such remarkable duties, but the rigors of the situation are not to be lightly explained away. The pictures of missionary life and work are vivid and detailed. Incidentally and by suggestion rather than by overt statement, we see how surprising it is, to noblemen reared in the atmosphere of pride and intrigue, that American missionaries should trust the common people as they do. It is probable that the natives who approached Dr. Underwood with the suggestion that he should establish a Presbyterian state church, were simply already within the shadow of the possibility of being forced into the Russian Church. One may discount the author's opinions as to the things said about both the Russians and "the Romanists," yet it seems reasonably certain that native intriguers tried to get up in Korea a disturbance like that of the Boxers in China, even going so far as to forge and send out an incendiary proclamation. It is almost beyond dispute that the same semi-political claims put forward in China by the French missionaries have been demanded and received by their confrères in Korea, and that the French minister at Seul has backed the pretences of his countrymen with diplomatic pressure.

The book, besides being neatly printed, is well illustrated with half-tone reproductions of photographs, but lacks an index.

The Harriman Alaska Expedition. Volume III., Glaciers and Glaciation, by Grove Karl Gilbert; Volume IV., Geology and Palæontology, by B. K. Emerson, Charles Palache, William H. Dall, E. O. Ulrich, and F. H. Knowlton; Volume V., Cryptogamic Botany, by William Trelease, C. H. Peck, P. A. Saccardo, C. E. Cummings, D. A. Saunders, J. Cardot, I. Thériot, and A. W. Evans. Doubleday, Page & Co. 1904. Imp. 8vo, with many illustrations.

Perhaps no journey is possible outside of the polar regions which would bring under direct and easy observation a greater number of living glaciers than that which the geologists of the Harriman Expedition have recorded here. With more than fifty busy cameras, the difficulty has been the selection of the most appropriate and beautiful illustrations from the multitude available. Dr. Gilbert's choice has been excellent, and the series of one hundred and twenty-four plates and text-figures offer the reader a worthy representation of the most characteristic features of Alaskan glaciation. The time spent at each of the many glaciers visited was necessarily small, and a large part of it was devoted to rapid surveys of the limits of the most important, in the hope that the record thus made would be available for comparisons at future dates, so as to give an accurate idea of the expansion or retreat of these mysterious rivers of ice. In one instance the work was most timely. Three months after the reconnoissance mapping of the Muir and its associated glaciers by this expedition, an earthquake so affected them that, during the five years which have followed, the bay into which they discharge has been so clogged with floating bergs that no vessel has been able to approach the locality of the survey within several miles. This condition of affairs has not occurred previously since Glacier Bay was first explored by John Muir.

Dr. Gilbert's volume is a summary of observations made, and a discussion of theories involved, upon which the data obtained by the party throw more or less new light. There are no startling discoveries. In the general view of glaciation in northwestern Alaska the writer comes to conclusions more in harmony with those of the mass of geologists than with the sensational and exaggerated opinions which have been expressed by at least one of the popular writers on this topic.

In volume four Professor Emerson discusses the general geology and lithology, of which perhaps the most conspicuous feature is the recognition of the Vancouver series of Dawson (Yakutat of Russell). This was proved to occur in many localities from Vancouver Island to Bering Strait, and identified by its fossils, which later in the same volume are illustrated and described by Ulrich, and referred to Liassic age. Dr. Palache has a chapter on the Alaska Treadwell mine, in which the previous conclusions of Becker are confirmed and added to, followed by a description of the geology of the vicinity of Stepovak Bay, Alaska Peninsula. In this locality Eocene strata were discovered bearing characteristic fossils, and filling an inexplicable gap in the geological column as hitherto developed for the Territory. Dr. Palache also contributes a list of minerals identified. Dr. Dall describes and illustrates the Eocene fossils collected by Palache, the Miocene marine fossils, and those of the boulder clay of Douglas Island. The volume is completed by a chapter on the fossil flora of Kukak Bay by Dr. Knowlton. In all, seven new genera and thirty-eight new species of fossils are added to our knowledge through the collections made on the expedition.

The volume on cryptogamic botany has been prepared under the supervision of Dr. Trelease by a number of specialists, and contains, perhaps, the largest addition (numerically) to the flora previously known. Formerly less than a dozen species of fungi had been authentically identified from Alaska, while the present catalogue enumerates two-hundred and forty. Four hundred and fifty-nine species of algæ, four hundred lichens, four hundred and sixty mosses, and fifty-seven ferns, bring up the census of Alaskan cryptogams to the very respectable total of 1,616 species, of which over one hundred are entirely new to science. Some use of the native plants is made for food by the aborigines, who dry dulse in large quantities, while the use of sphagnum, as an absorbent and as a wick for the Eskimo lamps, and of certain lichens for staining wooden ware and basketry, are noted. The cryptogamic flora of Alaska is essentially similar to that of the boreal region generally, but the moist and even climate of southeastern Alaska is so favorable that mosses and ferns attain an almost tropical luxuriance, while on the level tundras of the northern part of the Territory the sphagnums, reindeer lichens and stone lichens find a congenial habitat, and often form a natural carpet a foot in thickness. The volume is illustrated by forty-four full-page plates, many of them colored, and concludes with an excellent index.

The luxurious form in which the earlier volumes appeared is continued, and the illustrations are of the best, forming a striking testimony to the care and taste of the unwearied editor and the generosity of the patron of the expedition.

Memoir of Benjamin Franklin Stevens. By G. Manville Fenn. London: Printed at the Chiswick Press for private distribution. 1903. Pp. 310.

The last third of this volume is an account of the "Catalogue Index of *Manuscripts* in the Archives of England, France, Holland, and Spain relating to America, for twenty years, from 1763 to 1783." The compilation of this work was a labor of more love than lucre for Mr. Stevens, during nearly thirty years. It required a staff of assistants, residence in each of the countries enumerated, tirelessness, and confidential admission to copy documents that could never be removed from their secret cells—a favor never before granted so largely to any searcher. One hundred and sixty-one thousand authentic papers, never published with authoritative accuracy, were thus enumerated and cited. This catalogue is the sole key to American documents in European archives as a combined collection. These multitudinous papers with titles filled fifty volumes; those arranged chronological-

ly and descriptively a hundred volumes; while the alphabetical index required yet thirty volumes more. In 1882 Mr. Stevens offered this master-key to the original sources of American history to Congress, and its priceless historical value as absolutely unique was attested by the first scholars in this country and abroad; yet the offer, though he would have allowed the Government to make its own terms, was rejected during the decade thereafter; Stevens dying at the end of it, still at work on his *opus magnum*, or rather *maximum*. His faith was unfaltering that his writings, like the Sibyl's books, must be appreciated before all of them or their originals could be burned up.

Early in the sixties, however, Mr. Stevens had been employed by the State of New Jersey to transcribe whatever relating to its annals could be gleaned in the Public Record Office of England; and in the nineties, under the auspices of Congress, he published in facsimile a long and most interesting series of European manuscripts —a collection at once secured by instalments by all good libraries, and which no writer on the period or any part of it can afford to leave unstudied. Preëminent in interest are the private letters of high officials in all lines and in each country.

The two-thirds of Mr. Fenn's book which form the personal narrative of his friend Stevens often lack continuity. Fifty pages give a fair account of Stevens's birth and Vermont boyhood far up the Connecticut till at twenty-one, after a single year at Burlington College (owing to pulmonary and purse weakness), for lack of $180 a year he despairs of further education. The next five pages tell us little about the stripling —not a full sentence to show what he was doing—but they carry him through more than five formative years. They exhibit him in London at the close, and there assisting his older brother in that bookish work in which they both labored on to the very end. Their first great enterprise, the purchase of the Humboldt library and endeavor to sell it *en bloc*, went up in smoke. The aggregate was burned, and there was no insurance. This collapse, like the Chicago fire, only quickened energy. The younger Stevens was made the United States dispatch agent, and in some undescribed way so magnified his office that it helped him on and up. Their Humboldt failure was nothing to their Franklin success—an exploit regarding which Mr. Fenn vouchsafes us not one word. Their Franklinian gleanings—trifles which no others had considered worth snapping up—yielded them £7,000 from our Government.

Mr. Stevens, dying in 1902, lacked but one year of the Psalmist's three-score and ten —a life fairly prosperous, but exceptionally useful and happy. Though more than half his years were spent abroad, and he seldom revisited his birthplace, he yearned for it with an untravelled heart, as if it were the fountain of endless youth. In his country seat near London he reproduced its name, Barnet, slightly changed. Though Barnet had been long decadent, he gave $1,000 for keeping in order the sepulchre of his fathers. He grew old among sugar maple and butternut trees he had imported from the home of his childhood, and the gray squirrels whose gambols upon them were among his early memories. Born in full view of Mount Washington, which was then still held to be our highest mountain, he remembered among household words half a dozen peaks, each with a physiognomy which he could no more forget than the lineaments of his mother's face. His career furnishes a new illustration of the saying, old as the hills, that mountaineers die of homesickness, while lowlanders never do—Swiss, not Dutch. Before he was born, this proverb, as translated into Vermontese, asserted that no country is worth living in where a man cannot find his way without a guideboard.

Further Recollections of a Diplomatist. By Sir Horace Rumbold. London: Edward Arnold. 1903.

We live in an age of recollections and reminiscences. A public that has grown weary of pseudo-historical novels has apparently demanded something of more living interest, and, in response to this demand, every one whose career has brought him in contact with A., B., C., and other equally distinguished people is busy setting down his recollections of them in the best language he can command. A hundred years ago such books were generally entitled "personal narratives," thereby affording to a certain witty judge an opportunity of emphasizing the legal distinction between what is personal and what is real. But, while the writers of these modern *ricordi* may occasionally indulge in a little "embroidery," as a rule their pictures are fairly trustworthy, and will doubtless be of service to the future historian of the period.

A year ago Sir Horace Rumbold published 'Recollections of a Diplomatist,' describing his diplomatic career from 1849 to 1873. The present volume continues the story to 1885, and next year we presume there will be 'Still Further Recollections.' The earlier volumes depicted a dozen different diplomatic posts; the present one is confined to Santiago de Chile, Buenos Ayres, Berne, and Stockholm. The descriptions of the scenery of Chile and Sweden are interesting, and perhaps nothing in the volume is better than the following account of a tidal wave on the Pacific Coast:

"The hitherto motionless sea, stretching its perfectly smooth, glassy surface in the sweltering noontide as far as eye could reach—the glittering expanse only broken by a group of rocky islets in the nearer offing—suddenly began to recede from the shore, at first quite gently and majestically, carrying with it a certain number of vessels torn from their moorings close inland, and leaving others uncovered, like boulders strewn on the naked sand at low tide. Away rolled the 'painted ocean,' parting entire company with the land, and sweeping past the islets, which it also left quite denuded. Presently it returned, still with placid, unruffled aspect, but added impetus, forming, as it neared its natural boundary, a towering watery mound, upwards of fifty feet high, which, after overwhelming all the craft it had at first left behind it, made a clean sweep of every building on the shore line."

Political conditions in all countries change so much in twenty-five years that Sir Horace's records in this regard are rather out of date, and of no particular importance. Moreover, they are always tinged with the ultra-conservative dye of his political bias. His antipathy to this country is quite in keeping with his general views, and crops out in somewhat unexpected places, as when he speaks of Argentina as suffering from the adoption of a constitution precisely similar to that of the United States. He has also the temerity to refer to one American lady (by name) as "a duchess after an entirely new pattern," and to another, the wife of an American attaché, as "a lady who spoke both French and German well, but with an accent which lives in my ear as a perfect curiosity of its kind." Sir Horace is evidently a keen judge of literary values (from the book-selling point of view), and realizes that his dislike of Gladstone and his admiration for Beaconsfield are not quite as marketable commodities as personal remarks about people who are still living and are likely to hear from kind friends that he has referred to them in his book.

Studies in Theology. By J. Estlin Carpenter and P. H. Wicksteed. London: J. M. Dent & Co.; New York: G. P. Putnam's Sons. 1903.

The dual authorship of these lectures and addresses adds a good deal to the interest of either set, because it gives us two different and differently cultured minds, reacting on subjects of supreme importance. The effect approximates that of a joint discussion, though Mr. Wicksteed and Professor Carpenter have much more in common than in difference, and though neither apparently has written with the other in his mind. The quality of either's writing is scholastic overmuch, but Mr. Wicksteed as the Dante scholar and the ardent Ibsenite has a more literary inclination than Professor Carpenter, whose studies have been almost entirely in the direction of Biblical criticism and Hindu religion. Their illustrations and allusions smack of the different soils in which they have worked. Especially does the first lecture, "The Religion of Time and the Religion of Eternity," invite us to remark how far Mr. Wicksteed's study of Dante has carried him into the mediæval world, and with what enhancement of his sympathy with mediæval forms of sentiment and thought. It is the method of progress, in discarding what is evil, to discard some things that are good, and afterward to go back and gather up these things in such fashion as it may. Illustrating this principle, Mr. Wicksteed contends that the Renaissance and Reformation broke too absolutely with the mediæval world; that if they did not "throw out the baby with the bath," they threw out some good things with the bad. Among these are "the conceptions of eternity, fruition, and the vision of God." Mr. Wicksteed develops these in an extremely abstract manner, but his lecture really has a very practical application to the temper of the modern world. It is medicine for that sickness from which John Stuart Mill was suffering when he was overtaken by melancholy lest the progress of successful philanthropy should leave him with no more worlds to conquer. It was Richter's doctrine that "it is not the goal but the course that makes us happy," and Lessing's that "if he held truth captive in his hand, he would open his hand and let it fly in order that he might again pursue and capture it"; and of the same kind is the proverb, "Man never is, but always to be, blessed." Against these dicta and the modern spirit which they represent, so restless, so continuously dissatisfied, Mr. Wicksteed urges the satisfactions of accomplished good, and something stable at the

heart of endless agitation; and this is what he means by the religion of eternity as compared with the religion of time, contending that the mediæval idea of eternity was rather one of coexistence than of succession.

Two other lectures of Mr. Wicksteed's half-dozen invite special commendation; one, "The Significance of Unitarianism as a Theology"; the other, "The Fear of God and the Sense of Sin." The former takes a line that is very nearly parallel with Dr. Martineau's "A Way out of the Trinitarian Controversy." It concedes a certain reality in the Trinitarian doctrine as symbolizing God as the unconditioned source of being, as the loving and forgiving One, as the power *in* ourselves that makes for righteousness. But the Unitarian often neglects one or the other of these elements when he should bind them together in a closer unity than that of the Trinitarian theology, and Mr. Wicksteed attempts to show how this can be done. In conclusion he seems to make an absolute break with John Stuart Mill's most memorable phrase, "I will call no being good who is not what I mean when I apply that term to my fellow-creatures." The lecture on the "Sense of Sin" meets very squarely the objection made to Unitarianism by its orthodox opponents as deficient in this sense. The point urged is, that the true sense of sin is not a spiritual grace, but a consciousness of opportunity. Several of the concluding essays are sociological in their character, that of Professor Carpenter among these—a happy sign that the grandson of Dr. Lant Carpenter (the friend of Garrison) and nephew of Mary Carpenter, eager and ardent upon many lines of social help, is not disloyal to the traditions of a family remarkable for its philanthropic zeal.

Professor Carpenter's most elaborate and significant lectures are, however, on "The Education of the Religious Imagination," and "The Place of Immortality in Religious Belief," and a third on "The Relation of Jesus to His Age and Our Own." The first of these has for its purpose a plea for the sympathy of religions, the direct outcome of Professor Carpenter's Oriental studies. Here and elsewhere his view of Christianity is very simply that it is one of the great religions of mankind, one of the many expressions of mankind's universal religiousness. The lecture on Immortality discusses the causes of disbelief and various imperfect arguments, finds in the evolutionist's promise of the earth's destruction a hint of the survival of the soul, and bases the ultimate argument on man's nature as a spiritual being and the justice of God. By all means, the most interesting part of the lecture on the relation of Jesus to his age and ours is the parallel which is run between the early history of Christianity and that of the Persian Bâbîs, between Jesus and the young disciple of Seyyid Kâzim who, in 1844, announced himself as the "Bab" or "Gate," and, after six years of labor and suffering, at a high pitch of exaltation, was put to death, maintaining to the last a serene and noble majesty. Here were circumstances precisely similar to those which so recent an apologist as Dr. Illingworth presents, as many others have done before him, for irrefragable proofs of the miraculous incarnation of God in Christ Here was neither folly nor fraud, and yet in our own time a belief in the Bab as widespread and devout as that which grew up about Jesus within fifty years after his death. Professor Carpenter's parallel will impress some readers more than others, but it is certainly an interesting one, especially in the terms of his own careful presentation.

Lectures on the Logic of Arithmetic. By M. E. Boole. Oxford: Clarendon Press; New York: Henry Frowde. 1903. 12mo, pp. 144.

Elements of the Theory of Integers. By Joseph Bowden. The Macmillan Company. 1903. 12mo, pp. 258.

Mrs. Boole's is not a work like Dedekind's 'Was sind und was sollen die Zahlen.' The lectures are supposed to be addressed to children. "The earlier chapters are suited to little children, the later ones for children of fourteen or fifteen." There are twenty-three lectures or chapters, and "not more than one chapter is intended for use in any one term." The book can hardly be said to relate to the teaching of arithmetic, for, as the authoress says, it "is not intended to interfere with ordinary methods of teaching arithmetic." It aims to take advantage of a class having been formed in arithmetic, to teach the children a little logic. The logic, not too definite for the infant mind, is wholesome—occasionally quite refreshingly so, as when the writer says: "The sentimental people who assert that everything in arithmetic can be 'proved' to children have, usually, no idea of what rigid proof means." If she would delete "usually," every exact logician would agree with her. But we wish Mrs. Boole would treat the grown people for whom she writes, in this volume and in others, a little more as she says children should be taught. "If a teacher has anything to say to children as a statement [presumably she means as an assertion or as a proposition or in the indicative mood], he should say it, not exactly as a dogma which they are bound to believe, but as a working hypothesis which they are to assume as a basis for the present." This may be going a little too far, even in reference to assertions made to grown folk; but the tendency of it is good. If we are to believe everything in Père Gratry's 'Logique,' let it be when we come to see the truth of it.

George Boole was one of the great vehicles of truth of all time. Like all the great philosophers, he possessed the power of working his way to the truth with ideas that could not, at his time, be rendered entirely distinct, for he lived before the true logic of mathematics had been called into existence. He not only had this power, common to Aristotle, Descartes, Kant, Leibniz, and the rest, but he did what only one or two of the great philosophers was able to accomplish—he positively proved the truth of his idea. Gratry is no more to be compared with Boole than the lustre of Vega or Capella is to be compared with that of Jupiter. With some *aperçus* of high truth, his mind was too much in the attitude of prayer and of preaching to see the necessity of proving what he advanced. The infusion of Gratryism into Mrs. Boole's mind does the children no harm. We only fear that it may obstruct the reception of her wholesome ideas by teachers; as when she says, for example, "Arithmetic seems to some people dry and unbeautiful; but that is because they have not soaked it in that solvent which is called sympathy."

She hardly discusses the fundamental question whether or not it be desirable to cultivate the minds of young children in the direction of deductive logic. That is a matter to be carefully considered. The reviewer believes that she is right in thinking that it is desirable. This kind of logic —the logic of "Mamma says it is wrong" —we believe to be the very kind of thought for children. But it is too momentous a question in education to be hastily decided. Once grant, however, that logical conceptions are to be developed so early, and Mrs. Boole's methods of developing them are certainly exceedingly skilful and quite admirably adapted to the minds of children.

Prof. Bowden gives an independent development of his subject. That is a merit. Any person unacquainted with the logic of arithmetic could gain enough from the book to pay for the trouble of going through it carefully and critically. Further than that we cannot praise it. Its first paragraph is as follows:

"The concept of number, in its simplest and original sense, is a fundamental concept. It is incapable of definition—that is, it cannot be exprest in terms of ideas simpler than itself."

This is not so; and if it were so, there would be no use in such a book. There is no possible account of the logic of number that is not based on the logic of relations, whether consciously or not; and number does not express a simple relation, whether the ordinal or the cardinal numbers are regarded as primitive. This has been made perfectly clear in more than one of the books with the titles of which the footnotes of this volume are ornamented.

On page 3 we meet with this: "*Axiom.* Any number is equal to itself." A poor sense of logic must a man have to entitle this an *axiom*, when on the page before he had said, "To [the idea of sameness between two numbers] we give the special name *equality.*"

Whoever wishes to understand the logic of Integers should begin with Dedekind's little book, of which a translation is published by the Open Court Co. There is a good deal more to be read besides if one's appetite holds out.

BOOKS OF THE WEEK.

Annual Literary Index, 1903. The Publishers' Weekly.

Arnold, Matthew. Last Essays on Church and Religion. Friendship's Garland. Mixed Essays. (Popular editions.) London: Smith, Elder & Co.; New York: The Macmillan Co.

Ready April 23d

The Republican Party

A History of Its Fifty Years' Existence Together with a Record of Its Measures and Leaders. (1854-1904.)

BY FRANCIS CURTIS

With a Foreword by President Roosevelt and with Introductions from Hon. Wm. P. Frye, Presiding Officer of the U. S. Senate, and from Hon. Joseph G. Cannon, Speaker of the House of Representatives.

2 volumes, 8vo, with frontispieces, *net*, **$6.00** (carriage, 40c.)

A work that should be welcomed not only by Republicans but by every student of the political history of our nation. It is in no sense a campaign production, but is presented as a work of permanent authority for students, for readers and for reference.

Send for Descriptive Circular.

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.

THE NEW MACMILLAN PUBLICATIONS

FOR THE WELL SELECTED MISCELLANEOUS LIBRARY

Mr. HENRY W. ELSON'S

History of the United States

An accurate yet most interesting history in one 12mo volume has long been needed. Its proportions are unusually well-devised; its working apparatus is competent. The two features emphasized are institutional growth and the contributions of special personalities. *Cloth. Ready next week.*

Mr. EDGAR GARDNER MURPHY'S

Problems of the Present South

A Discussion of Certain of the Educational, Industrial and Political Issues of the Southern States

A singularly candid, clear, enlightened discussion of questions of the keenest national interest by the Secretary of the Southern Education Board.

Cloth, 12mo, $1.50 net. (*Postage 11c.*)

Dr. JOHN WILLIAMS STREETER'S

The Fat of the Land

The Story of an American Farm

"It is wonderfully attractive . . . and withal is as practical and full of common sense as a balance sheet."—*Brooklyn Eagle.* *Cloth, 12mo, $1.50 net.* (*Postage 13c.*)

By Mr. LOUIS C. ELSON

History of American Music

The second volume in the "History of American Art" edited by JOHN C. VAN DYKE. Uniform with Mr. Taft's "History of American Sculpture." *Imp. 8vo. $5 00 net.*

By Mr. WIRT GERRARE

Greater Russia

The Continental Empire of the Old World

"MR. GERRARE'S book, dealing with matters of his own observation, is extremely careful and accurate," says ARCHIBALD R. COLQUHOUN, for years the London *Times* Correspondent in the East. *Cloth, illustrated, 337 pages. $3.00 net.* (*Postage 22c. extra.*)

Edited by Mr. HERBERT PAUL *with an Introductory Memoir*

Letters of Lord Acton to Mary Gladstone

Written to the Prime Minister's daughter, the brief estimates of contemporary men, facts and books scattered through these letters, are expressions of the historian's lighter vein.

Cloth, 8vo, $3.00 net. (*Postage 16c.*)

THE NOTABLE NEW FICTION

Second Edition

The Adventures of Elizabeth in Rügen

By the author of "Elizabeth and Her German Garden," etc. "Merry and wise, clever and lovable."—*New York Times.* *Cloth, $1.50.*

Fourth Edition

The American Prisoner

Mr. EDEN PHILLPOTTS' new romance of the West Country. Illustrated by CLAUDE A. SHEPPERSON. *Cloth, $1.50.*

The Price of Youth

Miss MARGERY WILLIAMS'S wonderful sketch of a New Jersey girl is clever in its wit, full of spirited description, a charming romance, almost haunting in its intense reality. *Cloth, $1.50.*

The Story of King Sylvain and Queen Aimée

Miss MARGARET SHERWOOD'S contribution to the literature of pure joy. With illustrations in tint. *Cloth, $1.50.*

Just Ready

Daughters of Nijo

A Romance of Japan

By ONOTO WATANNA, author of "The Wooing of Wistaria," gives an unusually interesting view of the Imperial court of Japan. *Illustrated in colors and decorated by Kiyokichi Sano. Cloth, $1.50.*

The Court of Sacharissa

A Midsummer Idyll

Messrs. HUGH T. SHERINGHAM and NEVILL MEAKIN have "compiled from the traditions of the Irresponsible Club" this graceful piece of delicate fooling, delicious in its humor. *Cloth, $1.50.*

The Day Before Yesterday

Mrs. SARA ANDREW SHAFER'S irresistible story is "half humorous, half tender, wholly delightful," in its subtle understanding of a child's point of view. *Cloth, $1.50.*

The Singular Miss Smith

Mrs. FLORENCE MORSE KINGSLEY, author of "Titus: A Comrade of the Cross," "The Transfiguration of Miss Philura," touches with decided cleverness on phases of the modern social idea. (*Ready next week.*) *Cloth, $1.50.*

On NET books ordered from the publishers, carriage is uniformly an extra charge.

Published by **THE MACMILLAN COMPANY,** 66 Fifth Ave., N. Y.

The Nation.

NEW YORK, THURSDAY, APRIL 21, 1904.

The Week.

"We have a Pope!" was the announcement in the Conclave when it appeared that Sarto had a majority of the votes, and "We have an Opposition!" is the exclamation which the Democratic Convention at Albany may well provoke. At last we see a Democracy which, by the candidate it presents and the platform it adopts, proposes to make itself an eligible alternative to the Republican party. That is cause for general satisfaction. For eight years past, government by party has been essentially broken down in this country. The Opposition had made itself impossible. The party in power had been delivered from the fear of a rival and so from the fear of being called to account for arrogance, abuses, and corruption. On both parties and the whole country the effect has been pernicious. When a party has been headed wrong, the first step necessary is to make it face about. The question of leadership is secondary. This is said in no disparagement of Judge Parker, whose candidacy will acquire such an impetus from Monday's proceedings as in all probability to sweep everything before it. His personality, however pleasing and reassuring, will be of less importance than the platform. That is the strategic thing in this campaign. It is an open secret that Judge Parker himself so regards it, and that the St. Louis platform must be such as he can stand upon or he will not be a candidate.

In this light the Albany platform, as far as it goes, is gratifying. It is drawn with both shrewdness and force, laying down those general principles of government which can be most successfully invoked and applied as against Republican methods. It contains not one of those sops which it was confidently predicted would be thrown to Silverites and Socialists. The best evidence of this is the shrill protest of Hearst's incendiaries. The platform at St. Louis will, of course, have to be explicit on the money question. It will need to be enlarged by a declaration against Imperialism, and in other ways; but in the main contentions for a government of law, equal justice for all, no class legislation, honesty in the public service, no military adventure, no favoritism and no oppression, the Albany platform may well prove the rallying-ground of a sane and strong Opposition. That this sound and vigorous political deliverance had Judge Parker's approval is incontestable. That he cut out all of the baits and dodges which Hill wished to insert, may fairly be inferred. We have, accordingly, in his platform a trustworthy line on Judge Parker's political convictions. If the net result of the Convention is thus satisfactory, it must be said that it became so only as the wrath of man is somethimes overruled for good. Considered as a contest between Hill and Murphy, the Convention was not an inspiring sight. Tammany's sullen opposition to Parker will undoubtedly help him with the country at large.

Unseemly laughter has been provoked by the reference of the Republican platform in the President's own State to his zeal for the "solution of the problems of social economy." This is the nearest that New York Republicans dared to come to saying "Trust." That awful word, blurted right out within hearing of Wall Street, might dry up the streams of investment—in the campaign fund. Yet something had to be said about Mr. Roosevelt's endless speeches on the Trusts and his intervention in the Northern Securities case; consequently the masters of platform non-committal rose to the occasion with their splendid phrase about "social economy." But the untutored will be sure to think it has something to do with housekeeping. Others will contend that it refers to Mr. Roosevelt's well-known views about race suicide. But we must not forget the blessed ambiguities which reside in the word "social." Just as the "sociologist" of the coal-strike commission turned out to be a railway conductor, so we may yet find the President interpreting "social economy" into the most ferocious kind of "Trust-busting" campaign.

"Something must be done to save the party." With these words a leading Massachusetts Republican, amid the applause of the State Convention on Friday, urged a resolution calling for immediate steps to secure reciprocity with Canada. His speech seemed on the point of carrying the delegates off their feet, and Lodge had to go to the rescue. The Senator solemnly warned the Convention that it could not allow its platform to be "drawn by its opponents," and declared that the reciprocity resolution would be a "direct reflection on the Republican Administration." Of course, that settled it. But the incident plainly showed what a sword to divide the Republicans has been put into the hands of the Democrats in the shape of the tariff issue. And if there were any doubt on the subject it would be removed by the tariff plank actually adopted. It must have been written by Mr. Facing-bothways. Protection is "a cardinal policy," yet "tariff schedules are neither sacred nor immutable." "Rates of duty may be altered," but never by the Democratic party. In other words, the Republicans won't and the Democrats mustn't. But the tariff is not "sacred"; it is only ludicrous under such treatment. Where is the ancient humor of Massachusetts?

Representative Pierce of Tennessee recounts some of the extravagances of the present Administration, and says he believes "these reckless expenditures" will play an important part in determining the result of the November election. His case is certainly a strong one. Under the second Cleveland Administration the navy appropriations were $107,410,095; during the four years of the present régime they will be $335,172,935. Army expenses have grown from $94,349,535 to $360,442,896, and those for fortifications from $13,919,505 to $28,982,574. In these three branches the expenses have more than trebled. Mr. Pierce, who is a member of the Appropriations Committee, states that the first session of the Fifty-eighth Congress will be responsible for about $700,000,000 of expenditures. This is the best the Republicans can do in keeping appropriations down. They have left out river-and-harbor and public grounds and building bills, and have to some extent cut the estimates that have been presented. But still, they have practically disposed of the whole of the estimated revenue, and at the next session they are pretty sure to go to very much greater lengths. So far as Mr. Pierce can see, the Treasury will soon have to come into the money market for funds to run the Government. But when that has happened in the past, the party has stepped out and left the Democrats to perform the odious task.

Our "stand-patters" have accepted the doctrine that godliness is profitable for this life, as well as the next, and applied it to the Philippines. This fact is stamped all over the speeches on the Philippine Shipping bill. Congressman Lucking of Michigan, for instance, tells us that when he offered an amendment in committee that American ships, which are to have a monopoly of the carrying trade of the Islands, should be debarred from hiring cheap Chinese labor, he was voted down by his Republican friends. Thus is American labor refused any direct participation in the spoils from this revival of George the Third's policy. They all go to the shipowners, save what the Cordage Trust can wring from the people of the United States by reason of our violation of our promise of the open door. It will cost a good deal more to get hemp to the United

States, but American purchasers—confined chiefly to the Cordage Trust—will be able to buy the commodity in Manila at about $7.60 a ton less than foreign manufacturers. This concession has not reconciled the Trust to the Shipping bill, but whatever disadvantage it is put to will, of course, have to be made good by the people of this country. Congressman Lind of Minnesota says that the prison of his State makes binder twine, and he tells the Minnesota farmers that they will have to pay 75 cents to one dollar more for their twine on account of the Shipping bill. As Mr. Lind says, the bill is a subsidy measure; but instead of paying the subsidy out of the United States Treasury, we divide it between the Philippine Treasury and the consuming public in this country.

Has the long-promised "Farmers' Trust" at last arrived on the scene? A $50,000,000 corporation in South Dakota is to be known as the "National Farmers' Exchange." Its object is "coöperation in the handling of all products of the farms." The value of the farm products in the United States in the last census year, 1900, was about $3,700,000,000. This looks a trifle large for a $50,000,000 capital. Besides, how is the new company going to handle our agricultural resources? By buying the farms, or by cornering the products in the wheat, corn, oats, and other markets? The possibilities of a Farmers' Trust in these directions are infinite—greater, indeed, than the probabilities. But think of the influence of the scheme in politics! Your ordinary Trust confines its political activities chiefly to "standing pat" on the tariff. But the Farmers' Trust would consider the tariff only one mouthful. It would not deserve to live if it did not "stand pat" on irrigation projects, Government-built roads, and no one knows how many other raids on the Treasury. It was only last week that the Hon. Champ Clark arose in the House and asked if a bushel of Missouri wheat was not worth as much as one raised in the Columbia River Valley. Why not, then, deal as generously in the river-and-harbor bills by the Missouri Valley farmers as by those in Oregon? Matters of this sort afford real scope for a Farmers' Trust.

The projected defacement of the Capitol is at least postponed through a vote of the Senate committee referring the extension of the east front to a joint commission of six. This action probably marks the end of the attempt to place the matter in the unskilled hands of the Superintendent of the Capitol. Evidently, the Senate has come to realize that public sentiment demands the protection of the Capitol and the employment of the best architectural talent when any change is to be made. No building in the country contains so many associations for our people, and to alter it ineptly from ignorance or personal favoritism would bring down indignation upon Congress from all quarters of the land. For a year at least the Capitol is safe from its Superintendent. That will give time for further instilling into both houses reverence for the noble building bequeathed to them, and information as to the relation between architectural training and worthy monumental construction.

The following contract is of interest because both parties were Federal officers—D. G. Watkins, an assistant cashier in the Philadelphia Custom House; B. J. Kuntz, postmaster at Lehighton, Pa.:

"Contract between B. J. Kuntz and D. G. Watkins, August 9, 1902. D. G. Watkins agrees to concede Geo. Gray for State delegate.

"B. J. Kuntz agrees to use his efforts to have the lower end delegates vote for Brimmer (or some other man suggested by Watkins) for the Legislature, and Reese for Register of Wills.

"Watkins agrees to use his best efforts to have Kuntz appointed and confirmed as postmaster at Lehighton.

"(Signed) D. G. WATKINS.
" B. J. KUNTZ.

"Witness:
"(Signed) HORACE HEYDT."

It seemed to the Civil Service Reform Association of Pennsylvania that this document was proof of pernicious political activities. President Roosevelt had written that a Federal employee "should not take any active part in political management or in political campaigns, for precisely the same reason that a judge, an army officer, a regular soldier, or a policeman is debarred from taking such active part." To simple minds the attempt to swap a postoffice for a block of delegates looked like taking an active part in politics. But the Treasury Department, in finding that "the charges of pernicious political activity on the part of Mr. Watkins were not sustained," allowed this to be a legitimate and wholly unpolitical transaction. Yet Mr. Watkins was severely reprimanded—his whitewash was laid on with a stick, not a brush. But why should he be rebuked, one asks, if he had not offended, unless he belongs to that class of royal good fellows who can be told simply "not to do it again"?

In other cases contained in this annual report of the Pennsylvania Association, the President figures as a vigilant and active friend of civil-service reform. When Mr. J. H. Landis, the superintendent of the Philadelphia Mint, began discharging Democratic employees and replacing them by Republican "laborers" appointed without examination, Mr. Roosevelt brought him up with a round turn. Again, learning that postoffice employees who refused "to support the organization" were subjected to petty persecution—transfer to offices remote from their homes, and the like—Mr. Roosevelt read the riot act to Postmaster McMichael and rescinded the transfers. Possibly, the President took the greater pleasure in this act of discipline because McMichael was already in the black-books for making a political contribution to Senator Quay in violation of the Civil Service act. Taken broadly, the year has been one of progress, so far as the Federal service is concerned. The Association has received from Mayor Weaver at least platonic expressions in favor of enforcing the city act, particularly with regard to conducting examinations publicly; and finally, by circulating literature through the schools, it hopes gradually to undermine the spoils system in the most corrupt of our States. The zeal and success of these Pennsylvania reformers should give heart to us, whose task cannot be harder.

After Mr. Cleveland's latest letter on the subject, we hope no one will accuse him again of ever having shown any personal courtesy to a man whose skin was not white. His record in that respect (he would have us believe) is as clear as that of any former slave-owner. In these times of loose thinking, when so many are led away by the fallacy of a man being a man for a' that, and by gushing talk about genius and character and public service not being really dependent upon the cuticle, it is well to have a consistent example. As the poet has so finely expressed it:

"Honor and shame from no condition rise;
Blanch well your face, there all the honor lies."

The full text of the recent decision of the Supreme Court in the so-called "second Northern Securities case" reveals a strong desire on the part of the court to discourage all such attempts to invoke Federal jurisdiction. It was a suit instituted by the State of Minnesota, in one of its own courts, but was removed into the United States Circuit Court. The object of the suit was much the same as that in the suit brought by the Attorney-General, namely, to annul the merger—and the first point for the Supreme Court was whether any Federal question was involved. The State of Minnesota endeavored to raise a Federal issue in a variety of ways, the most original of which were, first, the argument that the merger was an injury to the State, because rates for supplies for State institutions would be affected by the cessation of competition between the merged railroads; second, the "full faith and credit" clause of the Constitution. The Supreme Court made short work of both contentions. As to the first, it said that the injury alleged was wholly indirect, and if the State could maintain such a suit, so could every individual in it—a

result not contemplated by Congress. As to the second, based on the theory that the defendants "had created a corporate device in New Jersey" in violation of the laws of Minnesota, the court held that the Constitutional clause had no bearing on the question, as it "has nothing to do with the conduct of individuals or corporations." The case was therefore remanded to the State court.

Since all the officers in charge of the *Missouri's* after turret were killed by explosion on April 13, it is unlikely that we shall ever have a complete explanation of the very shocking and apparently avoidable accident on that new battleship. What seems to have happened was the ignition of a service charge in a twelve-inch gun before the breech-block had been closed. Modern powder burns like so much camphor or resin. Accordingly, it is probable that the whole turret crew was immediately overcome by the flames. Let any sportsman experiment with a few grains of smokeless powder and a match, and he may readily imagine what occurs when four hundred pounds is burning in a turret. Strictly, the accident should be spoken of as a conflagration rather than an explosion. The fire passed in an instant from the turret to the handling room in the vitals of the ship, where four twelve-inch charges burned with a heat sufficient to melt the brass fittings on the wall of the magazine. It was like the ignition of a gigantic fuse leading from the after turret to the magazine deck. Only the promptest action saved the ship from destruction. The accident took place during a competition in rapid firing, and there is too much ground to fear that, in the desire to make a record, safety was thrown to the winds. Obviously, a charge half inserted will burn only if flaming gases or smouldering fragments of the previous charge are still in the barrel of the gun, for the service powder requires a special and powerful detonator. Possibly the responsibility will never be fixed, but it is clear that there is unwarranted peril in handling our largest guns like the rapid-fire calibres, which use fixed and relatively safe ammunition. In view of the horrible tragedy that has occurred and the worse calamity so narrowly escaped, the Navy Department should do something to prevent practice tests from being turned into mad rivalry in "beating the record." We lost more able seamen and officers on the *Missouri* than perished in the entire Spanish-American war.

Mr. Carnegie's "Hero Fund" seems to be based on the idea that society does not adequately reward those who put life or limb at hazard in its service. He feels, apparently, that the knowledge that the surviving family of one who had not counted his life dear would be provided for, would on the one hand stimulate to acts of heroism, and, on the other, relieve American society of the charge of ingratitude. Carefully hedged about by conditions as the gift necessarily is, it is a striking indication of the growing humanitarianism of Mr. Carnegie's benefactions. His library gifts he has habitually characterized as business investments, refusing to admit any sentimental interpretation of his unexampled liberality. Obviously, it will be more difficult to assume this dispassionate attitude towards such gifts as those to his native Dunfermline, the Carnegie Institution at Washington, and now the Hero Fund. We could wish it another name, for the good word hero has been sadly worn by use and ironical abuse, and we feel some misgivings about the practical application of the fund. It may tend to make the general public and individuals less responsive to deeds of daring. As things stand, we seldom see the spectacle of a hero's children begging their bread. Human nature kindles to a brave act, and the heroism of the father is often as good as a legacy to his children. Furthermore, there seems a certain impropriety in posthumous competitions in valor, and greater danger in any endowment that makes your unconscious hero a conscious applicant for a pension. Still, we anticipate good from Mr. Carnegie's unique foundation. It will bring to light many acts of obscure heroism, and under careful administration it will relieve cases of distress not otherwise presented to organized charity. But we hope nobody else will establish a rival hero fund until it is seen how Mr. Carnegie's works.

Mr. Balfour's majority on the Tibet matter illustrates the fact that a legislature is at the mercy of a headstrong executive. Technically, not a penny can be spent for a military expedition outside the Empire unless Parliament first has authorized the grant. Practically, the Colonial Office, or any of the viceroys, may dispatch a "diplomatic mission" without consulting Parliament at all. In Tibet it needed only the firing of a matchlock to convert such a pacific mission into a military expedition. Naturally, in such a case Parliament has to recognize things as they are, by giving a retrospective legality to an essentially illegal proceeding. The case certainly justified a direct motion of censure against the Government. Many members, refusing to shirk an urgent responsibility not of their making, would emphatically condemn a Government which has run heedlessly into war. Meanwhile, Gen. Macdonald having fought his way to Gyangtse, Col. Younghusband is ready to begin his work as diplomatic agent. The Tibetans may treat with him fearlessly, for has not Mr. Brodrick informed the world that England desires not occupation, or a protectorate, but merely "predominancy" as against Russia? The Buddhist pundits may possibly be put to it to discern the difference between a friendly predominancy cutting its way towards Lhasa and a hostile invasion. But, after all, Mr. Balfour will do the metaphysics if they will do the rest.

There was a terrible frankness about the Chancellor's speech at the reassembling of the Reichstag. He confessed surprise that "the superheated Japanese tea-pot" had blown off, admitted that he had been obliged to repeal the Anti-Jesuit bills in order to win the Centre party, and in general made a clean breast of several Government blunders and shifts. Of course, the most interesting part of his speech was his cordial praise of the Anglo-French treaty, and his assurances that German aspirations in the Mediterranean are solely commercial. Such professions may be accepted with reserve, but in any case they hint at a new tendency in international affairs by which the peaceful spirit may become as contagious as the warlike spirit has always been. But Von Bülow, if he be indeed the friend of the arbitration treaties, should recall that the attitude of contempt and misunderstanding which Germany maintained towards Japan, by no means makes for peace.

The story of the sinking of the *Petropavlovsk* by a Japanese countermine indicates a military strategy such as we believe no Occidental nation has ever surpassed. Admiral Togo's plan required an extraordinary combination of sheer intelligence and daring in its executants. The channel between the Russian torpedoes had to be plotted by distant triangulation, unarmored ships at night had to run into that narrow waterway, plant it with mines, and keep clear both of the Russian torpedoes and of their own; all this under fire from the harbor fleet. Probably the annals of war hardly show another trap of this refined ingenuity. To students of naval tactics, however, the tragedy of the *Petropavlovsk* is merely the culmination of a continued demonstration of the value of torpedo attack. Granting that this sort of countermining is without precedent, it is probably less significant than the whole series of attacks on the Port Arthur fleet by torpedo craft and other unarmored vessels. For the *Variag* is the only large Russian warship that is surely known to have gone down under gunfire. The crippling or destruction of about half the tonnage of the Port Arthur squadron seems largely due to torpedoes. The mosquito fleet has again and again dashed within range of the secondary batteries, and has come off without serious damage.

THE VIRTUOUS CONGRESSMEN.

The report of Representative McCall's committee on the "Charges concerning Members of Congress" is too glowing a tribute to the virtue of our lawmakers to be wholly convincing. The committee unanimously reaches the happy conclusion that "nothing has appeared in connection with said cases that would justify the finding that any member of the House of Representatives has profited financially in the slightest degree, or that any member was guilty of improper conduct in connection therewith, or that any member has done in connection with said cases anything that did not appear to be within the line of his official duty according to long established custom." The severest censure that the committee permits itself to utter is the admission that "undoubtedly there are letters which were carelessly written. The action in some cases was not well considered. The statement found in some instances in letters from the executive officer, that what was done was done as a favor to the member, might well have been resented." But, after venturing this mild and (as respects the "natural" resentment) naïve reproof, the committee adds: "There is nothing in any of the cases considered that reflects upon the integrity of the membership of the House of Representatives."

Indubitably, this sweeping generalization might fairly apply to some members whose names are mentioned in the charges. In one or two instances the Senator or Representative upon election to office, knowing that he could not legally make a contract with the Government, had asked to have a lease of his building cancelled. Other Congressmen had transmitted requests from constituents in a purely formal fashion. The report explains that the mass of the people look to their Representative as "the one important officer of the Government they come in contact with"; and they naturally make through him any protest or petition. As Representatives are generally willing to pose as a power in the land, they have rather cheerfully borne this burden which custom lays upon their shoulders. In so far as the committee had such cases in mind, the report of exoneration is faultless.

There are, however, certain facts which the committee has had to ignore completely in order to become convinced of the spotless propriety of Congressmen. The performances of Warren B. Hooker, now a Justice of the Supreme Court in this State, are a striking example. When he was a Representative, a kinsman of his, Maurice Hooker, was appointed a laborer in the post-office at Fredonia and drew $600 for doing no work whatever. Two other "laborers" in Mr. Hooker's district—according to the original Bristow report—drew in all $5,633.62, for which they rendered no service. Mr. Hooker also procured for Dunkirk successive rental increases: from $565 to $1,350, from that to $1,500, and finally to $2,000, "with no additional service." All that Mr. McCall's report says is this:

> "The Government agreed to pay a sum apparently much in excess of what should have been paid at an office of that character—certainly if reference is had to the amount it was paying before the present arrangement was made. In that case the present Representative from the district took little part, and such recommendation as he made related to the location, which appears to have been the most convenient one available."

Hooker is thus barred from consideration because he is no longer in Congress. Apparently all the wicked members have failed of reëlection under this present reign of righteousness.

We wish, however, the committee had expatiated on the probity of Leonidas Felix Livingston of Georgia, who is sitting in the present House and ought to have been within the committee's purview. The Washington correspondent of the *Tribune*, who has had unusually accurate information of these postal scandals, notes that on November 29, 1901, Mr. Livingston called at the Post-Office Department, and, although a recent investigation had showed that the office at Conyers, Ga., was entitled to only $160 for clerk hire, prevailed upon the accommodating Beavers to make the amount $820. Then Mr. Livingston, who seems to have been no drone, secured the appointment of his grandson in the Conyers office at $720 a year. When this man, who was so fortunate in his choice of a grandfather, was transferred to another office, the clerk-hire allowance for Conyers at once dropped to $100. The omission of any reference to Representative Livingston will rouse in most minds a suspicion that the McCall committee has not made a clean breast of the investigation, but has held itself to a very narrow range of inquiry.

This suspicion is strengthened by the evident animus against Fourth Assistant Postmaster-General J. L. Bristow. When he reported to the President last November, he said, in discussing increases of clerk hire at the request of members of Congress: "A hundred other similar cases could be cited. The millions that have been appropriated for that purpose during the last four years have been used by Beavers largely as an official perquisite for the benefit of his personal and political friends." Mr. Bristow apparently exaggerated; there were not a hundred other cases, and Beavers had not diverted every dollar of the "millions" that passed through his hands. Mr. McCall's committee accordingly condemns Mr. Bristow more harshly than it condemns any Congressman, for statements "which would scarcely seem to be measured and temperate." And the Democratic minority, not content with this reproof, reviews at length Mr. Bristow's own serious shortcomings in the case of certain Kansas post-offices. Thus the report as a whole gives the impression that Congressmen are all angels and that the only sinner is Mr. Bristow, who dared to question their unsullied purity.

But on three points the committee is unassailable. It rejects "the theory that a member of Congress is justified in asking for financial favors from the Government which he believes it would not be proper to grant"; and of course the committee does not believe, with Representative Grosvenor, that a Congressman's duty is to grab all he can for his constituents. It is heartily against the much discussed "secret rules" for the disbursement of money; and it says with justice, "Their application for any length of time will be sure to engender favoritism and, ultimately, corruption." The committee would also restrict to "the narrowest possible limits" the action of members in connection with "executive matters." Such restriction would not only, as the committee says, "augment the efficiency of the House of Representatives"; it would be a return to the sound theory upon which our Government is based.

The report does not in the least satisfy the public demand for a thorough investigation of the Post-Office Department. Senator Lodge's promise of an investigation "in our own time, in our own way" is as empty as the pledge to reform the tariff by its friends. Meantime it has been discovered that the Post-Office is being investigated by Messrs. Conrad and Bonaparte, and the Senate waives any inquiry of its own as being "supererogatory." Naturally, the virtuous express entire confidence in the work of these gentlemen, while the peccant are only too willing to wait until they are found out. It would have been small satisfaction to Senator Burton, for example, to have had the evidence against him presented six months earlier by a committee of his colleagues. Accordingly, Mr. Conrad and Mr. Bonaparte may work while the Senate sleeps the sleep of the unconcerned. We agree heartily that an investigation of the connection of Senators with postal irregularities would have come out nowhere. Integrity self-certificated is cheap. But both the Senate and the House will stand condemned before the country for taking no broader view of post-office matters. The personal malfeasances revealed at every insertion of the probe are only the sign of deeper organic disease. Not only the personnel but the business organization of the Post Office requires overhauling. It is no answer to the charge that millions are being wasted in the Post-Office to say that the President's commissioners may yet catch a Congressman or two whose "rake-off" has run to mere thousands.

CHAIRMAN AND GOVERNOR.

"No man can serve two masters: for either he will hate the one and love the other, or else he will hold to the one and despise the other." This truth is as old as humanity; it has found expression in the proverbial philosophy of all races. The fundamental principle has often been violated by fools or rascals, and they have inevitably been overtaken by disaster. Every one who has read history or has observed the careers of his fellows can cite numberless instances. The latest and most conspicuous is Benjamin B. Odell, jr. He fancies he can at once serve two diametrically opposed interests: can be Governor of New York and chairman of the Republican State Committee.

If the Republican party or any other political organization were an aggregation of pure-souled patriots, absolutely free from all selfish interests, intent only upon the common welfare and ready to sacrifice everything to that noble end, a man might conceivably reconcile the claims of the chairmanship and the governorship. But in practice all party machines are selfish; the machinists are chiefly concerned to procure places and fat contracts for themselves and their followers, and they generally regard efficient and economical administration of the public business as distinctly subordinate to partisan success and incompatible with it. The Governor must be vigilant in keeping down expenses, cutting off sinecures, dismissing supernumeraries, and exacting faithful service. He finds his sworn enemy in the chairman, who is zealous to swell every budget for the sake of the rake-off, to stuff every department with incompetent and superfluous heelers, and to keep all officials engaged, not on the tasks for which they are paid, but on political work. It is a condition, not a theory, which confronts us; and this condition makes it easier to ride two horses galloping in opposite directions than to be an honest Governor and to satisfy the party demands upon a State chairman.

Mr. Odell's daring experiment in equitation will be watched with apprehension by the Republicans throughout the nation, who will be vitally affected by the result. The nomination of Judge Parker by the Democrats—which is now practically assured—will make the coming contest a close one. The leaders on both sides are reaching the conviction that Roosevelt cannot afford to lose any support. That he should deliberately throw away the electoral vote of New York is inconceivable; and yet if Gov. Odell continues his dual rôle, that vote will surely be Democratic. Under the most favorable circumstances the State is probably Democratic; Odell carried it by less than 10,000 in 1902 against such a weak candidate as Coler. As yet but little has been said about Gov. Odell's assumption of the chairmanship; but when the campaign has fairly begun, the significance of that step will be blazed upon every dead-wall from Montauk Point to Buffalo. Much slighter provocation than such gross official impropriety would turn the State against Roosevelt.

The Republicans of this State, as well as of the nation, have also some rights to be considered. They elected Mr. Odell to be Governor, not chairman. Had the possibility that he would attempt to be both been suggested, his slender majority would have dwindled to nothing. He is guilty of a flagrant breach of contract with the people of the State of New York, as immoral as the repudiation of a debt. The voters would never have dreamed of turning over to the chairman of either party the vast authority of the Governor, his command of the resources of the tax, excise, charitable, penal, and general supply departments, his control of legislative bills involving millions of dollars. No party, drunk with power or crazed by hunger, would submit such a wild proposal at the polls. In plain terms, the people have been swindled.

Last week's Republican convention undoubtedly marked the final enthronization of Odell as absolute boss, master of the party's destinies in this State, and tyrant over its members. Into the Governor's motives for his extraordinary course we do not pretend to penetrate. It may all be sheer love of power. If the State chairmanship is worth more than the Governorship, what may they not be worth together? As State Chairman, Mr. Odell knows that the next Legislature will be his if any Republican's, and that, whatever happens, he will be in command of many legions. Defeat at the polls he can afford to smile at. A State Chairman has the only business that we know of—except that of domestic servants—in which one can go on unaffected by discredit or failure. The position is plainly one of tremendous power. "No man," said Lincoln to Dr. Bellows, "willingly lays down such power as I possess." Odell knows the potentialities, beyond the dreams of avarice, which reside in the State boss, and if, in addition to that motive, he is spurred on by personal pride and pique to show his detractors within the party that, like him or not, they have got to obey him, we perhaps arrive at the most reasonable explanation of his desire openly to subjugate the party.

No one need deceive himself about the legislative situation at Albany. It is what the Governor makes it. All important legislation is shaped by him. His orders issue, and his puppets in either House execute them. No bill of any consequence is passed, none is killed, none is held in suspended animation, except at the Governor's nod. This does not mean that he will sign all the bills which the Legislature has passed. Judiciously vetoed bills sometimes constitute a valuable political asset. We understand that the Governor means to veto some of the worst of the grab measures. But he could just as well have caused them to die the death in committee, or on the floor of Senate or Assembly. Never has it been so true as this year of legislation at Albany that a breath creates it and a breath destroys—and the breath comes from the Executive Chamber.

This is but an example of the iron sway with which Odell now proposes to rule the party throughout the State. He will not only bear, like the Turk, no brother near the throne, but not even a party dog will he allow to howl against him in the street. His bowstring and poison will be ready. What is it to him that his methods are offensive, that enemies spring up like mushrooms along his path, that his cool absorption of every party function in his own person is leaving old-fashioned Republicans aghast? He has the power. That is enough for him. Let others talk of tact and conciliation and the gentler political arts; whip and spur answer his purpose. Drive and flog the voters into doing your will—and if they won't, why, there Odell still is, the party boss.

This is a part of the ugly situation in New York State which makes Roosevelt's best friends quake. Some of the foolish ones among them are endeavoring to extract comfort out of the fallacious argument concocted in Washington. It is that Odell, having now trampled the party under foot and made himself supreme, is bound to produce a majority for Roosevelt. But this is mere whistling to keep one's courage up. Of course, the Chairman-Governor will strike an attitude of great energy and determination. No outward appearance will be neglected. But what will be easier, when all is over, than for the boss to say that he had done all that mortal man could, but that no manager and no party could carry the dead weight of an unpopular candidate? Such are the considerations, such the fears, that lie upon the surface of the political situation in New York to-day. Gov. Odell's assumption of the purple only too plainly causes his party to feel blue.

THE REAL FRIEND OF LABOR.

A thoughtful correspondent has recently warned us against minimizing the peril of the Hearst candidacy, on the ground that Mr. Hearst at least seems to be "a friend of labor." The labor vote, it is maintained, will not be cast for any one who has not conspicuously deserved well of workingmen. The only hope for Democracy, then, is, rejecting Mr. Hearst as a rank impostor, to put up some candidate who is indubitably labor's friend. Many earnest

people hold this view. They recognize the considerable element of just discontent that lay behind the free-silver craze, and hold that the same sense of social injustice has persisted, and that the real Moses of the Democracy must lead it straight against the Canaanites of Trust industry and finance.

The view has just enough plausibility to be pernicious. It is true that the Democrats must have something more than a merely negative platform, and that they cannot hope to win unless they attract workingmen. But it by no means follows that any promise of success lies in palavering labor as such, or yet in choosing a candidate who is personally dear to the average horny-handed son of toil. For, in the first place, no such candidate exists as a Presidential possibility. Only a corporal's guard of Democratic workmen would support, say, Mr. John Mitchell, in spite of his great popularity and unchallenged credentials, as their advocate. Indeed, when you come to define your friend of labor, the task becomes of enormous difficulty.

Mr. Hanna, for example, was in every personal sense labor's ideal friend, abounding in good will towards his own employees, and working for good relations between all who pay wages and all who take them. Yet not even a Pauline conversion would have made him a possible labor candidate. As for the great body of vague humanitarians possessed of social panaceas, the laboring man understands them just enough to distrust them. Again, the random activities of dilettante settlement work or superior observations of the manner of living of "the other half" produce anything but the type of persons who care to go or could go into higher politics. In short, whenever labor turns to its professed friends, it finds people whom no thinking man wishes to see at the head of things. One might propose one or all of the prominent figures in trades-unionism, socialism, humanitarian endeavor, and labor would very properly vote "no confidence" in its representatives. That is, the customary cant, or the honest and perfervid sentiments that prevail in the union headquarters, the debating hall, and the socialistic press, simply vanish when so serious a matter as the choice of President is at hand.

The war of classes is not yet upon us. Politically, we still vote as men, and not as capitalism, bourgeoisie, and proletariat. A saving instinct still tells us that our politics is something other than our business, and our laborers know that, at bottom, their advancement will come from what they themselves can beat or wheedle out of their employers, and not from the special favors of a paternal government. Indeed, in the very nature of the case, labor stands to lose in the scramble for special favors. Suppose a benevolent administration actually votes a chicken in every pot, what is such a dole to the fiat profits of the protected manufacturer, to the percentage of the favored contractor, to the mileage of the mail-carrying railroad, to the gains of the thrice-watered corporation? No, when special favors are being distributed, capital gets the apple, and labor may consider itself lucky if for it there is so much as a core left.

The real friend of labor, then, is not the forerunner of prosperity nor the vendor of social patent medicines, but simply the man who will stand for equal laws and the abolishment of special privileges. There would be more practical social justice for this nation in repealing the iron and steel duties than in all the visions of Karl Marx. There would be substantial relief of the poor in the reduction of the tariff, free shipping, and the consequent enlargement of foreign trade. All that would close a thousand channels through which the workingman is mulcted to-day, and would put palpable money in his savings-bank account. The candidate who promises labor anything more than an even chance is not its friend, but its beguiler. Storming against the inordinate profits of the Trusts in staple products is empty words. The reality is, stopping the collusion under which Congress hands over these artificial gains to the Trsuts.

Our workingmen are not fools, though they are often deceived. They are shrewd enough to suspect anybody who employs in a platform the phrases that they themselves use chiefly to express a mood or vaguely to shadow forth a hope. They know that their real friend is he who promises them relief within the field of practical legislation and administration, and even the hotter heads are amenable to arguments of good sense. No friend of Judge Parker's (or of any other honest Democrat of Presidential capacity) need hesitate to present him as a friend of labor. And this friendship will need to be proved by few words and very simple pledges. Indeed, labor itself will have its misgivings about any friend who displays his union label too flagrantly.

MORE SILVER PURCHASING.

Under existing law the total amount of subsidiary silver coin authorized to be issued from the Mint is limited to $100,000,000. That limit is nearly reached, and, of course, the demand for small change will be progressive while the population continues to increase. In anticipation of future wants the Secretary of the Treasury, in his last annual report, recommended that authority be given him to add to the subsidiary coinage such amounts as might be needful to meet the public demand, and to use for this purpose silver dollars now in the Treasury and owned by the Government. The effect of this step would be to convert a given amount of silver from a form in which it is not demanded by the public, into a form in which it would become at once useful. A bill to carry out the Secretary's recommendation was reported to the House some days ago, but last week an amendment to the Sundry Civil Appropriation bill was reported to the Senate simply removing the limit to the amount of subsidiary coinage authorized by law.

The Senate amendment has a very innocent look, but there is a cat under the meal tub. Without the additional clause recommended by the Secretary, it reopens the door to silver purchases to an indefinite amount. Under the coinage law of 1873, all subsidiary silver coins are to be made from bullion purchased by the Mint, so that whenever the $100,000,000 limit is exceeded and the bullion in the Treasury purchased under the Sherman act is exhausted (as it will be on the first of July next), new purchases must begin. The Director of the Mint must go into the market and buy silver, although the Government has upwards of 9,000,000 standard silver dollars on hand which the public are not willing to take and which are consequently useless.

No defence of this revival of silver purchases has been offered publicly. It is presumable, however, that the timid souls who preside over financial matters in the Senate see a lion in the road in the person of Mr. Bryan, fearing lest he charge them with the intent to dishonor the "dollar of the daddies" by lowering it to the denomination of halves, quarters, and dimes. This, by the way, is what all the governments of Europe which have any large amount of legal-tender silver in their circulation are now doing. They are converting it into small change, thus making it serviceable to the public and allowing a larger percentage of gold to flow into the circulation. It is possible, also, that the silver-mining interest has brought some pressure to bear on the Senate wing of the Capitol in order to improve the market for that metal.

However that may be, we trust that the House will stand by the Secretary and boldly fight it out. The method adopted by the Senate to "ring in" the renewal of silver purchases is in conflict with its own rules, being new legislation on an appropriation bill. It repeals an existing law and revives an old one —both without debate—whereas both propositions ought to be debated. If so debated, the arguments of the Secretary and of the Director of the Mint and the report of the House committee, which includes and supports them, will be found overwhelmingly strong. Not the least of these is the argument from economy. The $9,000,000 now available in the Treasury will be saved if the House measure is adopted, not to mention future savings of like nature. Moreover, there will be an additional saving in the way of seigniorage by converting dollars

into halves, quarters, and dimes, each standard dollar yielding $1.07 by the recoinage.

The most mischievous effect of such a renewal of silver purchases is that it opens without debate a door that has been closed after debate and on due consideration. It resumes a policy that was stopped, for good reasons, in 1893. If now resumed, nobody can tell how long it may continue or how much silver may be added to the circulation. It may not be limited to the amount really needed for subsidiary use. Under the act of March 14, 1900, the Secretary of the Treasury has power to suppress the small silver certificates and issue the larger denominations in place of them. If he should do so, there would be no form of currency available for the future demands of retail trade smaller than the gold quarter-eagle and the silver dollar. As the latter cannot be increased in amount under the present law, silver subsidiary coins would be necessary to fill the vacuum. Thus room would be found for one or two hundred millions more than we now have. As nobody can guarantee that a Bryanite, or Mr. Bryan himself, may not be the Secretary of the Treasury at some future time, the danger of opening new doors to silver coinage ought to be plain to everybody who is opposed to Bryanism in finance.

THE DUKE D'ENGHIEN.

PARIS, April 6, 1904.

Count Boulay de La Meurthe has recently published the first volume of the 'Correspondance du Duc d'Enghien.' He has for several years been devoting himself to the publication of historical documents, among them a valuable collection of those relating to the conclusion of the Concordat, the treaty made with the Papacy by Napoleon while he was First Consul, and still in force, regulating the relations of the Catholic Church and the State.

The documents concerning the Duke d'Enghien throw much light upon the life of this young Prince, who was shot in the moat of Vincennes on the night of the 21st of March, 1804. He was a direct descendant of the famous Condé whom his contemporaries called Monsieur le Prince le Héros. His grandfather gave in 1789 the signal for the emigration. He left Chantilly and formed in Germany the little army called Condé's. This army was for a time well organized, and was divided into regiments formed exclusively of French noblemen, and into paid regiments, formed of recruits of various nationalities. A large correspondence relating to the formation of these regiments and to their campaigns is preserved in the archives at Chantilly; it has never been published. The passions which divided France in 1789 are not quite subdued after a century. The young Duke d'Enghien writes in one of his letters: "People have said, in France, that we were traitors, and they have succeeded in making some of our number ashamed of their conduct. As for myself, I glory in it, and nothing will make me change." These few lines well exhibit the state of mind of the young duke when he took his place in the ranks of the army of Condé. He was the principal lieutenant of his grandfather, and he had under his direct orders the regiment of paid soldiers which bore his name, the Enghien dragoons.

In the campaign of 1800, the last in which the army of Condé played a part, he was attached to the Austrian army commanded by the Archduke John. This campaign ended in the defeat which Gen. Moreau inflicted on the Austrians at Hohenlinden. The Archduke John signed with Moreau an armistice, which was followed by the peace of Lunéville. During the long armistice Condé's army practically vanished. Desertion decimated rapidly the paid regiments; as for the gentlemen, they were very homesick, and did not always resist the temptation to return to France, which was made more and more easy by the Consular Government. "It is the fashion to go back," wrote the Duke of Enghien, "as it was the fashion to go out." Emigration, as he well said, was essentially a fashion at first, but it had lasted ten years, and many of the *émigrés* had grown tired of their erratic and miserable life.

It was at first a question of sending the remains of the army to Naples or to Malta; but the English Government announced its intention to send them to Egypt or to India. The most determined of the *émigrés* were discouraged by the prospect of such a distant exile. The Prince de Condé resolved to disband his little army. "As for myself," he wrote, "my age, my health, and approaching infirmities, the still uncertain state of France, the blood of the Bourbons which flows in my veins, do not allow me to make war like a filibuster." Some *émigrés* enrolled themselves individually in foreign armies; others, who had slender means, settled in Germany; the English Government gave each man a year's pay; the great majority returned to France. The old Prince de Condé, who had no longer any army, retired to England. He found there his son, the Duke de Bourbon, father of the Duke d'Enghien; the Count d'Artois, and the Princes of Orleans, the sons of Philippe Égalité. He tried to induce his grandson, the Duke d'Enghien, to follow him to England, but encountered great resistance on the part of the young Prince, who felt that, "in view of the horror which the name of England inspired in France," it was impolitic for the Bourbons to accept English hospitality. He had had, besides, some differences with his grandfather during the wars on account of the manner in which the military operations were conducted.

Probably the strongest reason of all for his refusing to go to England and for remaining in Germany was the strong attachment he had formed for the Princess Charlotte de Rohan-Rochefort, who lived at Ettenheim. There still hangs a cloud of doubt over the exact nature of the relations between them. The grandmother of the Prince, wife of the Prince de Condé, was a Rohan-Soubise; there was consequently nothing extraordinary in a marriage of the Duke d'Enghien with Charlotte de Rohan. But we have on this point positive declarations of the young duke to his father and grandfather. When the character of his affection for the Princess de Rohan seemed to them to point to a marriage, he protested that their fears were idle. "I am taking advantage of the little time which remains to me before duty compels me to accept more serious, but probably less agreeable, ties. . . . I have never led you to think that I am so wrongheaded as to commit great follies. . . . I have never thought of it." These lines seem to put an end to the legend of the secret marriage, and to make it probable that the Duke d'Enghien believed that he could only marry a lady belonging to a reigning family. The Bourbons, after the Restoration, never recognized the Princess Charlotte as Dowager Duchess d'Enghien; but Louis XVIII. was very intractable on all points touching the royal prerogative. Must we believe that the Duke d'Enghien simply followed the examples set him by his grandfather and his father? His grandfather lived publicly with the Princess of Monaco, who followed him in the emigration, and he consented to marry her only after forty-eight years of companionship. His father, the Duke de Bourbon, contented himself with very low mistresses in England, and it is well known under what influences he fell in the greater part and at the end of his life.

The legend of the secret marriage of the Duke d'Enghien has derived much strength from the character and attitude of the Princess Charlotte. She was a high-spirited person, well worthy to be the wife of a descendant of the great Condé. At Ettenheim, which was in the Duchy of Baden, the Duke d'Enghien led a very quiet life. He had the shooting of a large domain, and he could hunt the wolf in the Black Forest. It was said that the young Prince sometimes went secretly to Strasbourg. He defends himself against this imputation in his correspondence: "They know me very little who have said or believed that I have set foot on the Republican territory, otherwise than at the place and with the rank to which I am entitled by my birth. . . . One may travel incognito on the glaciers of Switzerland, as I did last year, having nothing better to do; but as for France, when I make the journey I shall have no need to conceal myself." This is an answer also to the fable which I have heard, and which has found its way into some book, of a visit made by the Duke d'Enghien to Paris, and of his visits to Mademoiselle Georges, the famous actress, who was at the time the favorite of the First Consul.

From his retreat at Ettenheim the Duke d'Enghien kept his eye on events in France and in Europe. He had no illusions as to the sentiments of the great Powers: "To be a French *émigré* is to be nothing. An *émigré* is neither more beloved nor more esteemed; he is looked upon as a dangerous creature, as one who has been smitten with the plague, and who carries contagion with him." Sometimes, in his discouragement and idleness, he thought of taking service in a foreign army, as many princes of Savoy and of Lorraine had done. He wrote to his grandfather: "I hope, dear grandfather, that you will not disapprove of my following the career for which I was born." The old Prince de Condé answered him: "This is not made for you. None of the Bourbons ever took that road. All the revolutions in the world, whatever may be said to you, will never prevent your remaining to the end of your life what God alone has made you. Fix that well in your head. At the beginning of the war, which I can say I made as well as another, I refused to accept any grade in the service

of foreigners; this is what you also must do."

The Duke d'Enghien, after receiving this letter, refused an important command in the Austrian army, which was offered to him by the Archduke John. His sentiments prevented him also from taking any part in the conspiracies hatched in France. This seems well proved by all the documents published by Count Boulay de la Meurthe. After the attempts of Georges Cadoudal and the Chouans against the life of Napoleon, he wrote: "These are not my ways, and if my letters have been opened, I am not sorry that people should have learned of my way of thinking and my constant disapproval of measures which I judge unworthy of the cause we serve." "Very likely," wrote the Prince de Condé to his grandson, "people have judged that what has just taken place was no more in my way of thinking than in yours; for I myself no more than you was in the secret of the great project which has just failed."

The Prince de Condé was, however, preoccupied with the idea that his grandson was not in safety in Ettenheim, so near the French frontier. He advised him, in a letter dated from England the 26th of March, 1804, to choose a town more distant from France, and, if possible, a garrison town. At the date when this letter was written, his grandson was no longer alive, and five days had already elapsed since the Duke d'Enghien was shot in the moat of Vincennes. All the details of the fearful tragedy are well known. M. Boulay de la Meurthe will, however, give us, in the second volume which he promises, documents of interest, especially touching the degrees of responsibility in the drama of the First Consul, of Talleyrand, of Réal. I was reading only a few days ago the chapter which Sainte-Beuve devotes to Talleyrand, in his admirable "Nouveaux Lundis," and I must say that Sainte-Beuve's severity seemed to me only too well justified. Political pamphlets are but shortlived, and many pamphlets have been written on this subject; poetry lives longer, and all the readers of Lamartine's 'Meditations' remember the lines picturing Napoleon at Saint Helena:

"Et toujours en passant la vague vengeresse
Jetait le nom de Condé."

Correspondence.

TWO EARLY AMERICAN LETTERS ON ELECTRICITY.

To the Editor of The Nation:

Sir: The approaching bicentennial celebration of the birth of Benjamin Franklin renews our interest in one of the greatest names in the history of electricity—a science which, in its practical applications, America has made peculiarly her own, and in which one of her sons made an experiment that carried his name and that of the place of his birth around the world. Franklin's kite experiment, by which he established the identity of the lightning in the sky with the electric spark, is thought, perhaps by most persons, to be his most important contribution to the subject of electricity; but this is far from the truth. Even at this day his numerous experiments with Leyden jars, with electric shocks, with relations between electricity and heat, his theories of electricity and magnetism, are well worth considering. In these researches we perceive a great mind at work, endeavoring to penetrate the mysteries of a subject which continues, even after the lapse of two centuries, to baffle the greatest intellects. I was present at a dinner lately where a distinguished English scientist expressed the opinion that we could still learn much from Franklin; he found the latter's experiments most suggestive, and he remarked that we seemed to be returning to a theory of electricity which resembled in many respects the one-fluid theory of Franklin.

Among the historical manuscripts in the Library of Harvard University are two which are of great interest to the student of electricity. One is a letter from Benjamin Franklin to Prof. John Winthrop; and the other is Professor Winthrop's notebook of the lectures he delivered on Natural Philosophy between 1738 and 1780. Franklin's letter is written in a beautiful hand, which I should be tempted to characterize as feminine if beautiful feminine handwriting were not converted, at present, into the Virginia-fence style. The letter runs as follows:

Phila July 20, 1764.

Sir I received your Favour of the 12th past, and congratulate you on the Recovery of Mrs Winthrop and your Children from the Small Pox.

Mr. Stiles return'd Apinus to me sometime since.—I must confess I am pleas'd with his Theory of Magnetism.—Perhaps I receive it the more readily on Acct. of the Relation he has given it to mine of Electricity.—But there is one Difficulty I cannot solve by it, quite to my Satisfaction, which is that if a Steel Ring be made magnetical by passing Magnets properly round it, and afterwards broken into two Semicircles, each of them will have strong N. & S. Poles, in whatever Part the Ring is broken. I I have not try'd this, but am afraid 'tis so: & I know that a magnetic Bar broken has after Breaking 4 Poles i. e. it becomes two compleat Bars.—I think with him that Impermeability to the El. Fluid is the property of all El.' per se; or that, if they permit it to pass at all, it is with Difficulty, greater or less in different El.' per se. Glass hot permits it to pass freely, and in the different degrees between hot and cold may permit it to pass more or less freely.

I shall think of the Affair of your unfortunate College, and try if I can be of any Service in procuring some Assistance towards restoring your Library. Please to present my Respects and Compliments to Dr. Channing, Mr. Elliot and Mr. Cooper and believe me with sincere Esteem

Sir

Your most obedient humble Servant

B. Franklin

My Respects to the President, & to Mr. Danforth.

This reference to the impossibility of preventing the formation of two opposite poles in a piece of magnetized steel, however the piece is broken, is interesting from two points of view: it shows how the early investigators were hampered in trying the simplest experiments from lack of the varied mechanical facilities of the present day; and it shows that, with all our practical knowledge of magnetism, we are as ignorant of the cause of polarity in a piece of steel as Benjamin Franklin was. The distinguished Englishman I have referred to thought that the prevailing theory of electrons should lead us to reconsider Franklin's one-fluid theory of electricity, for Franklin explained the attraction or repulsion of two pith balls by the diminution or excess of his one fluid. The electron or corpuscular theory of the present explains the same phenomena by the detachment or aggregation of the electrified negative particles. Whether we fix our mind on a fluid or a collection of electrified particles, we can arrive at a plausible explanation of electrical attraction or repulsion.

The lecture notebook of Winthrop contains one lecture on electricity delivered in 1764, probably the first on this subject given in an American college. John Winthrop was the only professor of natural philosophy in the American colonies, holding that chair in Harvard College between 1738 and 1780. The notes are as follows:

"Electricity is a property of some bodies wh. alternally Attracts and Repels all Light Bodies at a Sensible Distance, and is so called from electric amber, which is a property peculiar to that Body. Some sorts of Bodies, as all Glass, all precious Stones, and Sulphurs and all Dry animall Substances, have this property and are called Electricks, and all Bodies that have not this Quality are called Non-Electricks, such as water, wood, metals, etc. Electricity is excited in Bodies by Attraction; a Tube of ¾ of an Inch Diameter and two or three foot Long being rubed, will Attract or Repel Light Bodies such as Leaf Gold, Soot, paper, etc. But non Electricks may become Electrical, by resting on an Electrical. and touching a non-Electrical wh. Touches the excited Electrick. If a flaxen string (wh. is not Electrick) be extended and supported and at one end an excited Tube be apply'd Light bodies will be attracted and That at the Distance of 1200 feet at the Other End: this Electricity since the year 1743 has made a Considerable noise in the World; upon wh. it's suppos'd Several of the (at presant hidden) Phænomina of Nature Depend; it has been Carry'd to so Great perfection that an Electriz'd man by touching heated Spirits of wine he has set them on flame: If a man stand on pitch or Glass and hold a non Electrick in his hand, wh. touches a Glass Globe that is whirl'd with prodigious Velocity, be touch'd in any part of his Body, There immediatly succeeds a Considerable flame with a sensible pain and a Crackling Noise.—Men have been so Electriz'd; as to have a Considerable Light round their heads, and Bodies, not unlike The Light Represented Round the heads of Saints by the painters."

This lecture, it is seen, contains an intimation of the possibility of conveying signals by electricity.

In Franklin's time the popular interest in electricity was divided between the subject of lightning rods and the possibility of curing diseases by the remarkable and mysterious manifestations of energy. Now that the transmission of power and of intelligence by electricity has reached a high degree of perfection, we begin to see a reversion of interest to its possible curative powers. Electro-therapeutics is an important branch of medicine even if we are somewhat skeptical as to the direct effect of electricity upon the human organism, and regard the results as largely due to suggestion. This skepticism was shared by Franklin, who, in speaking of the large numbers who came to him to be healed, says: "Exercise in the patient's journey and coming daily to my house, or from the spirits given by the hope of success enabling them to exert more strength in their limbs, may be the cause of the improvement occasionally noticed."

The bicentennial celebration of Franklin's birth will doubtless give due prominence to

his anticipation of the modern electron theory of electricity. JOHN TROWBRIDGE.

CAMBRIDGE, MASS., April 16, 1904.

"CŒLUM NON ANIMUM MUTANT."

TO THE EDITOR OF THE NATION:

SIR: A friend calls my attention to a passage in F. A. Paley's 'Fragments of the Greek Comic Poets' which bears a certain interesting resemblance to a part of Whitman's "Song of Myself." The Greek poet is Philemon, who died 262 B. C.; this the passage:

"Happy the animals! They do not bother
Their heads about this question and another;
None make inquiries, none need take the trouble
To prove that black is white, or single double.
No self-inflicted woes, no cares have they;
All their own nature, their own laws obey.
We mortals live a life not worth the living,
To laws and politics attention giving,
For sons providing, pedigrees unwinding,
Yet some excuse for worry always finding."

The Whitman passage will at once occur to all who know him tolerably well:

"I think I could turn and live with animals; they are so placid and self-contained,
I stand and look at them long and long,
They do not sweat and whine about their condition,
They do not lie awake in the dark and weep for their sins,
They do not make me sick discussing their duty to God,
Not one is dissatisfied, not one is demented with the mania of owning things,
Not one kneels to another, nor to his kind that lived thousands of years ago,
Not one is respectable or unhappy over the whole earth."

Here is no deadly parallel, but one sufficiently striking, considering the distance from Camden to Athens, and the twenty-two hundred intervening years, and the improbability that Whitman ever saw the Greek passage or heard of Philemon.

JOHN W. CHADWICK.

BROOKLYN, April 18, 1904.

TURGENEFF'S NOVELS.

TO THE EDITOR OF THE NATION:

SIR: The reviewer of the two translations of Turgeneff's novels in the *Nation* for February 4 says that "it is unfortunate that Turgeneff's critical essays, reminiscences, and correspondence are apparently not to be included in this new edition," meaning Miss Hapgood's. It seems that Mrs. Garnett's translation does not even contain all his novels. (Miss Hapgood's edition not being kept in stock in the bookstores, I have not been able to compare the two editions in this respect.) Among the novels that Prof. Herman Almkvist of Upsala has translated are two that are not included in Mrs. Garnett's translation, namely, 'Landtlif' (Country Life), and 'Två Vänner' (Two Friends). And in his introduction to the first volume of Mrs. Garnett's translation, Stepniak mentions as one of the most interesting of Turgeneff's novels 'The Country Inn,' which I cannot identify with any novel in any of the fifteen volumes.—Yours truly,

AKSEL G. S. JOSEPHSON.

CHICAGO, April 11, 1904.

Notes.

Macmillan Co. announce that Mr. Stephen Phillips's new work, put down for publication in the autumn, "is at present called 'The Sin of David.'"

Fox, Duffield & Co., New York, announce for early publication 'Crozier's General Armory: A Registry of American Families entitled to Coat Armor,' edited by William Armstrong Crozier.

From the January Proceedings of the New England Historic Genealogic Society (Boston) it appears that Mr. J. Henry Lea's volume of Abstracts of Wills in the Prerogative Court of Canterbury, England, Register *Soame*, 1620, will be published by the Society as soon as the index is complete. As the 'Genealogical Gleanings' of Mr. Henry F. Waters, Mr. Lea's predecessor, has more than paid for itself, we have no doubt that the Canterbury Wills will be equally fortunate, in which case progress will be made with Register *Dale*, 1621, and succeeding volumes. As Mr. Lea points out in a very useful article on "Research in England" in the April *New England Historical and Genealogical Register*, the British Record Society has printed the names of all the testators in the above court from 1383 to 1604, and is now engaged in filling the gap 1605-1619. Mr. Lea will carry on the work to 1630, and J. & G. F. Matthews, London, are now issuing the Probate Act Books from 1630 to 1640. This brings us nearly to the Civil War, which checked emigration to America. The Boston Society is also publishing the vital records of Massachusetts towns, and has those of Braintree and Waltham in the press.

Volume six of the dignified 'English Bible, Translated out of the Original Tongues by the Commandment of King James the First, anno 1611,' in David Nutt's notable series of "Tudor Translations," contains the New Testament; and now we commend anew the completed enterprise to all who would have the original version in its quaint spelling, with modern paragraphing, the original marginal notes, generous and elegant print, fine paper, simple but effective binding in wine and gold. Those who read the Bible as English could hardly desire a better edition.

Of like service is A. R. Waller's edition of Thomas Hobbes's 'Leviathan; or, the Matter, Forme, and Power of a Commonwealth, Ecclesiasticall and Civill' (Cambridge, Eng., University Press; New York: Macmillan), in the series of Cambridge English Classics, which it leads off. The form is a square 16mo. The edition here copied is the first issue, in 1651, and with a literalness (even to the punctuation) which is confirmed by a list of needful departures. The original pagination, further, is indicated. Alternative readings from the inferior reprints of 1651 are massed at the end. Beyond his care for all this, Mr. Waller has compiled an index of persons and places other than Scriptural. The series is certain to win favor.

To Macmillan's Pocket American and English Classics has just been added Palgrave's 'Golden Treasury of Songs and Lyrics' in its fullest form, and now this standard anthology is to be had for twenty-five cents. For this price one may not demand expensive manufacture, but the text is the thing.

The elder Pierce Egan's 'Life of an Actor' (1825), for which Theodore Lane furnished the illustrations, many colored in the fashion of the period, is reissued in D. Appleton & Co.'s series of "popular editions of rare and famous books," on which we have frequently remarked.

The Baker & Taylor Co. of New York bring out in very attractive shape a small and rather readable volume by Edgar S. Maclay entitled 'Moses Brown, U. S. N.,' which is, as the writer says, "not so much a life of Moses Brown as a picture of the daily perils, hardships, privations, and adventures of the average naval officer in the early days of the service." Captain Brown's exploits when in command of the privateer *General Arnold* during the Revolution are well worthy of a place in our nautical annals, while his career in the navy was honorable, if brief. The book tells us less about Brown than we could wish, but the most has been made of the scanty material available. It is a good sign that such obscure sailor patriots, who did their modest duty and received little or no reward, are beginning to be rediscovered after generations of neglect.

The Danish philologist and phonetician, Otto Jespersen, who is one of the most eminent advocates of the "new," "natural," "reform," or "direct" method of modern language instruction, has brought out through Sonnenschein-Macmillan an English version of his very successful 'Sprogundervisning.' 'How to Teach a Foreign Language' contains not only an able defence of the extreme views of the "reform" party, but also a store of pedagogical suggestions which will be useful even to disbelievers. In the general argument there is little or nothing that has not already been said many times—first in America, and a quarter of a century later in Europe; not much can be urged against the author's thesis, provided we admit that the object of language teaching is mainly utilitarian. In the specific directions and model lessons there is a great deal that is both novel and excellent. While interesting to read, the work lacks the brilliancy and originality which distinguish Henry Sweet's 'Practical Study of Languages' from all other treatises on the subject. The English translation, by Sophia Yhlen-Olsen Bertelsen, is good.

In his second volume, 'Physical Training for Women by Japanese Methods' (G. P. Putnam's Sons), Mr. H. Irving Hancock continues to misspell the Japanese word jū-jutsu, which he writes jiu-jitsu, and to give forth, as before, slipshod statements as to Japanese history and public hygiene, while showing himself a master in theory and practice of his special subject. His perspective of chronology needs to be greatly foreshortened. His general remarks about the superb physique of the Japanese woman may be taken with several large grains of salt, while his knowledge of the extent to which the natives of Japan are victims of tuberculosis seems to be exceedingly limited. Apart from these criticisms, which belong mainly to his introductory chapter, we have in this volume an exceedingly valuable manual prepared by one who not only is master of the craft himself, but is a very wise teacher, for he knows well the limitations of both his pedagogic and his human subjects, and understands the principle of gradation and progress. The abundant illustration by half-tone reproductions of photographs from life strikingly reinforces the text, and we have here a manual which, if wisely followed and used, will enable most young women to do without drugs and the prescribers and dispensers of them. Those who patiently master the first chapter by practice as well as by reading, and who bring something of the Oriental imitation of nature's methods, without valuing time too highly, will probably be as-

tonished at what women can do in the development of both their muscular and their vital resources. The book may not abolish utterly the conception or the actuality of the "weaker sex," but certainly here is a highly scientific system not only of bodily development, but of rapid and convincing attack and defence. After many years of observation of results, we can bear witness that the main contentions of the author are sound. The chapters entitled "The Perfect Chest" and "Obesity and Leanness and the Remedies" will not be overlooked.

The Baker & Taylor Co. issue 'Golf for Women,' by Mrs. C. T. Stout, better known in golfing circles as Miss Genevieve Hecker, who not only is the best American woman player, but is believed by good judges to be quite on a par with the best women players in England. As illustrating the development of physical culture among American women, this fact is significant because our male champions have not yet succeeded in reaching the English standard. So far as we know, this is the first golf book written by a woman for the special benefit of women, and it is safe to say that no woman player, however skilful, can fail to profit by a careful study of it. In addition to accurate descriptions of the different strokes, admirably illustrated by photographs from life, Mrs. Stout gives her readers the benefit of her successful tournament experience in such matters as training, clothing, etc., the importance of which increases as the quality of play improves.

Mrs. Jane Dearborn Mills's 'The Mother-Artist' (Boston: The Palmer Co.), in spite of its fanciful title, proceeds from an experienced educator, and urges the rewards of parental care and worry, with apt instances of character training. It does not plough as deep as race suicide. On the other hand, it gives the father more than his customary share of authority, or at least wisdom, in practical discipline. It is pleasantly, often skilfully, written.

The thirty-fourth annual volume, Transactions and Proceedings, of the American Philological Association, presents about the usual range of topics. The main body of the Association, as always, clings closely to the Latin and Greek, while the Pacific Coast branch devotes its attention more largely to more modern themes. The topics considered at the last meeting were in most cases of purely technical interest, but the opening paper, on "Tacitean Ellipsis," has much of value to any intelligent reader. Some of the best material presented has found publication in other channels, as Prof. C. M. Gayley's paper on the question, "What is Comparative Literature?" which appeared in the *Atlantic Monthly* last summer, and Prof. Charles Forster Smith's address on "Character Drawing in Thucydides," which stands at the head of the current number of the *American Journal of Philology*, belated three months by the Baltimore fire. It is interesting to learn from the proceedings of the Association that the 120 members who registered themselves by postal-card vote as in favor of changing the time of meeting to December, have a better record for attendance at the July meetings than those who voted to retain the July date, 187 in number. The Association has before it for determination at the next meeting a proposition to abandon the usual form of publication, an annual volume of Transactions and Proceedings, and put forth as separate monograms, hereafter, such papers as are deemed worthy of publication. The next meeting is to be held at Cornell University, July 5-7.

Dr. George E. Barnett's 'Final Bibliography of American Trade-Union Publications,' prepared by the Economic Seminary of the Johns Hopkins University (University Studies, Series XXII., Nos. 1, 2), deserves the thanks of all serious students of the new tyranny. Except in the earlier years, this list is restricted to the publications of national and federal organizations. It indicates the archives and libraries in which the several items may be found. A noticeably large proportion consists of constitutions.

A Select List of References on Chinese Immigration—to periodicals as well as to books—has just been compiled under the direction of Mr. A. P. C. Griffin of the Library of Congress.

The current report of the Librarian of Congress acknowledges among the year's gifts Miss Susan B. Anthony's entire library of 2,000 volumes, rich in documents and periodicals of the anti-slavery and woman's-rights movements; and "one of the most notable gifts in manuscripts ever made to the Government," viz., "that of the Andrew Jackson papers by the family of Montgomery Blair, Postmaster-General from 1861 to 1864." They comprise more than 2,000 separate pieces, besides letter-books, orderly-books, broadsides, and newspapers, etc. This collection has already been arranged and calendared. There has also been acquired by purchase the Webster correspondence not bequeathed to the New Hampshire Historical Society by the late Peter Harvey. It comprises some 2,500 pieces, and fits on admirably, chronologically, to the Jackson collection. Finally, the papers of Commodore Edward Preble have been joined to the foregoing, with 125 pieces of Virginian material (1649-1774). A year ago President Roosevelt ordered a very important transfer of the Revolutionary archives from the Department of State to the Library of Congress. The volume closes with the report of the Register of Copyrights on Copyright Legislation, in which we remark the valuable bibliographical list of foreign copyright laws in force.

The likeness of the present age to the first century of the Roman Empire in many important particulars has often been pointed out, but a new evidence of similarity has been detected by a reviewer of Dr. Paul Brandt's recent edition of the 'Ars Amatoria' of Ovid, in the current number of the *American Journal of Philology*. Why does it occur to Dr. Brandt and other recent writers, he asks, to emphasize the modernity of Ovid (a quality noticed only in recent times) "unless it is true that, for the first time since Ovid's day, the world is getting back to the point at which it mirrors in itself and, therefore, appreciates certain phases of thought and points of view as they were in the first century of the Roman Empire?" The reviewer insists, on his own account, that, whatever the tendencies of the 'Ars Amatoria' may be, it is without doubt the masterpiece of a great author. One is reminded here of a prominent American critic's similar declaration of the essential excellence of the 'Don Juan' as a masterpiece of literature, irrespective of its tendencies. Perhaps, however, it is not exactly "the world" that is getting back to the point designated, but only a comparatively small section of the world of letters.

The *National Geographic Magazine* for April opens with an account of a trip from Bombay to Bagdad by Mr. D. G. Fairchild of the United States Department of Agriculture. Its object was to secure for the American date garden of Arizona the best varieties of Persian and Arabian date plants, the expense being borne by Mr. Barbour Lathrop of Chicago. The article is finely illustrated with photographs of characteristic scenes, as is also that on American deserts. This is a summary of the first report of the Desert Botanical Laboratory of the Carnegie Institution, established at Tucson, Arizona, for the investigation of the special devices of desert plants for the absorption and storage of water and for resisting substrata of unusual composition, like the gypsum sands of the Tularosa Desert. Mr. James Page of the Hydrographic Office treats of the sailing ship with especial reference to the Panama Canal. He shows that, furnishing 28 per cent. of the total tonnage of the world, the ship is still and will continue to be an important factor in commerce. Its profitableness has been greatly increased by the saving of time through the better knowledge of the meteorology and physical geography of the sea. Thirty years ago the average length of voyages from the Lizard to Valparaiso was 102 days. In 1892 it was 83 days. The saving of time in the round trip of a sailing vessel from New York to San Francisco through the Canal would be 111 days.

Scandia is the title of a "Monthly Journal of Scandinavian Languages and Literatures" which in January began publication in Groningen, Holland. Its principal editor is Dr. H. Logeman, professor in the University of Ghent, Belgium. As contributing editors appear the names of a number of prominent Scandinavian scholars and several well-known Norwegian, Swedish, and Danish novelists. *Scandia* is published in Dutch, but it is planned to offer in every number an article in a Scandinavian language. Each number will furthermore contain reviews of recent books, a chronicle of Scandinavian events, notices, etc. The principal articles in the three numbers that have appeared so far are: an appreciation of the novelist Jonas Lie by Chr. Collin, an article on "Danish Ballads" by Margaretha Meijboom, and one on "The Danish Glottal Accent." The following numbers will contain, among other things, an account of "The University Extension Movement in Sweden," by Prof. Fr. von Scheele, and an article on "The New Norse Language," by Arne Garborg.

The formation of a Norwegian Folklore and Dialect Society in Christiania will be of interest to folklorists and to students of dialect in general. This society purposes: (1) A study of the life and traditions of the Norwegian people; (2) a scientific investigation of the Norwegian dialects. It is in reality a reorganization of a similar one formed in Christiania in 1881, but which, owing to lack of support, enjoyed only a brief existence. In the meantime interest in the dialects has grown, and the new organization starts under more favorable auspices. Among its active members are such well-known scholars as Sophus Bugge, Johan Storm, Moltke Moe, A. Tar-

anger, Marius Haegstad, and A. B. Larsen, besides a number of younger scholars. Three issues of its official publication, *Norvegia*, edited by Larsen and Hægstad, have appeared. The etymology of the word Norway is discussed by Mr. Hægstad in an exhaustive article, in which he traces the form of the word from its earliest occurrence down to the present. The phonology of one of the most archaic of Norwegian dialects, that of Selbyg, is treated by his colleague. *Norvegia* appears in quarterly numbers of about eighty pages. The subscription price is about $1.10.

The Iowa Anthropological Association, organized on October 5, 1903, held its first general meeting at Iowa City on February 13. One of its main objects will be to study the works of the Iowa mound builders. A survey of the State for the location of the mounds is planned. Some work in this direction has already been done before by D. J. H. Ward, who was made secretary of the Association.

The Cologne *Gazette* reports that a Rousseau Archive is to be established at Geneva. It is intended to include all the manuscripts, bibliographical and pictorial matter in any degree of interest in connection with the author of the 'Contrat Social.' The City Council of Geneva has assigned one room in the Public Library building for this purpose, and has decided to give the archive an annual grant of a certain sum. A "Société des Études Rousseauistes" has also been organized in Geneva to care for the collection.

The proceedings of the Bostonian Society contains an interesting paper upon the psalms, tunebooks, and music of the forefathers, by E. N. Bagg. It is a compendium of facts relating to the church music of the colonial days, and is interspersed with numerous anecdotes. A paper by A. Sargent treats of the foreign and coastwise trade of Boston in the forties and the men who carried it on, the merchants in the old signification of the word, "shipowners, charterers of ships, or importers by the cargo." The frontispiece is a colored reproduction of Capt. Cyprian Southake's map of Boston harbor, 1689.

—More and more American historians are regarding the Revolution in a new spirit and from a different point of view—in the spirit of greater fairness, and from the point of view of English colonial administration. The result of this is to be observed in Marshall De Lancey Haywood's 'William Tryon and his Administration in the Province of North Carolina, 1765-1771' (Raleigh: E. M. Uzzell). The title is somewhat misleading, however, for the essay is not a technical study in colonial administration, but rather a memoir, genealogical and antiquarian, set, so to speak, in the framework of a discursive historical narrative. No bibliography is given, but the author has relied, apparently, on the records of North Carolina mainly. Secondary accounts appear to have been carefully studied also; but no unprinted material, so far as can be gathered from the footnotes, has been used. The political events of the period are touched upon, but nothing is gone into in much detail save, perhaps, the insurrection of the "Regulators." It is sufficiently shown that this movement was in no sense a prelude to the Revolution. On the other hand, the "Regulators" "nearly all became Tories" when the opportunity to fight for America offered. While the author's attitude towards Tryon is essentially favorable, it is far from being merely laudatory. Mr. Haywood seeks to prove nothing, but merely to arrive at the truth. Much material of interest to genealogists and antiquarians has been interwoven into the narrative. We have noticed no positive errors, though we must conclude, from the statement at page 27, that the author's faith in the Mecklenburg "Declaration" has survived the disintegrating influence of seventy years of skepticism; which is more than can be said for the faith of most historians.

—The Macmillan Co. publishes 'Representative Modern Preachers.' The author is Dr. Lewis O. Brastow, theological professor in Yale University. In a less elaborate form his present chapters were lectures to his theological students. There are nine chapters on Schleiermacher, Robertson, Beecher, Bushnell, Brooks, Newman, Mozley, Guthrie, and Spurgeon. A more liberal disposition would have included Channing, Martineau, and Parker in the scheme. If nine was the extreme number possible to Dr. Brastow's diffuseness, Mozley and Guthrie might have made way for Channing and Martineau. There is some variety of treatment, a more developed sketch of the preacher's life being given in some cases than in others. In each case we have a sympathetic appreciation of the preacher's substance of doctrine and manner of preaching—in the one respect, no quick scent for heresy; in the other, no glozing of defects. The abstract and formal treatment is sometimes strangely at variance with the vital spontaneity of the preacher under consideration. As a theological influence, Schleiermacher could hardly be overrated. He is the master of all the progressive orthodox who palter in a double sense. It is hardly just to Newman to say that, in his 'Development of Christian Doctrine,' "he undertakes to apply the modern doctrine of Evolution to the dogmatic system of the Roman Church," seeing that Newman's book antedated Darwin's 'Origin of Species' by some fifteen years. Without surprise one finds Roman Catholics claiming that Newman was a precursor of Darwin. Mozley, another Tractarian, was the least popular of Dr. Brastow's chosen company; but it is safe to prophesy more literary permanence for his sermons than for Beecher's or Spurgeon's. His "Reversal of Human Judgment" has been called the greatest sermon of modern times, and one notes approvingly that a New England college president read it once a year for its moral tonic quality. Mozley was nothing if not paradoxical, and Dr. Brastow seems to have overlooked his most conspicuous trait.

—One of the most interesting of many debatable boundary problems is that offered by the dividing line between the United States and Mexico, where it is determined by the lower Rio Grande, as may be seen in a two-volume quarto report prepared by our commissioner, Gen. Anson Mills, and lately issued by the Department of State—'Proceedings of the International (Water) Boundary Commission, United States and Mexico' (Washington). The original treaty of 1848 described the boundary as running "up the middle of the river," without making any reference to shifting, meandering or short-cutting, although such changes were perfectly well known to geographers as habitual in rivers on alluvial plains; this disregard of physiographic complications being comparable to that by which the possible independence of mountain crests and river divides was overlooked in the boundary treaties between Argentina and Chile. A later agreement provided that our Mexican boundary should accompany the shifting of the Rio Grande channel as long as the shifting was of gradual progress by lateral erosion and deposition; but added that whenever the shifting was due to the abandonment of an old channel as the result of the opening of a new one, the boundary determined by the surveys of 1852 under the treaty of 1848 should remain in force, even though the abandoned channel should become wholly dry. Under this agreement, lobes of the flood plain—called "bancos" on the Rio Grande—isolated by river shortcuts and cut-offs would not change their allegiance, even though the river must flow between them and their mother country. The "bancos" are of perfectly normal form and origin, such as may be seen by the score on the alluvial plain of the Mississippi, yet our commissioner reports: "We found the bancos so utterly different from our anticipations that both the Mexican commissioner and myself, after long and deliberate consideration, have concluded that their process of formation, their form and constantly changing character, could not have been contemplated by the conventions creating the treaties of 1884 and 1889"! Inasmuch as the river may, in a few decades, shift several miles from a "banco," leaving it as a little "enclave," entirely surrounded by foreign territory, it is evident that the maintenance of the boundary of 1852 would in such cases embarrass the administration of the law, local, State, and national; hence the commissioners now recommend that a "banco" be transferred to the country by which it comes to be surrounded, provision being made for the transfer of the evidence to titles to land to the new local authority, and the inhabitants, if any, being allowed to retain their former citizenship if they choose. At the time of publishing the report, action had not been taken on this recommendation; hence the detailed maps by which the report is admirably illustrated (in spite of their being bound in reverse order to their numbering) contain about fifty examples of undetermined boundaries awaiting future decision.

—Vol. XX. of the valuable "Monographien zur Weltgeschichte" (Bielefeld and Leipzig: Velhagen & Klasing; New York: Lemcke & Buechner) is Dr. Otto Hötzsch's 'Die Vereinigten Staaten von Nordamerika.' He presents, in condensed form, a well-written, sympathetic, and in most essential features fairly accurate sketch of the history and growth of our country, from its earliest beginnings down to "Expansion and Imperialism: The New America since 1893." If Dr. Hötzsch lacks the penetrating insight of a Von Holst, he manifests much more than the merely academic interest of the average German student of American conditions. His chief fault is a certain looseness of statement with regard to the more recondite aspects of his subject. Thus, he writes: "Pennsylvania has grown more rapidly than any other single State of the Union. Coal,

iron, and petroleum have made it the richest State. But this, along with the mental impress given to its inhabitants by Quakerism, has had for effect that it has but rarely been a really leading power in the Federal Union, in the sense in which Massachusetts, Virginia, and later South Carolina and New York have been." This on the whole is a shrewd judgment as to the relative importance of Pennsylvania. And yet it is not Quakerism that has in later years given the Camerons and the Quays their benumbing influence over the State. On the same page (18) we read: "The Middle States had a mixed population in common with Pennsylvania. In New York English administration took the place of the Dutch, but the property and rights of its inhabitants were left untouched. And thus it remained long a Dutch-German (!) town." The tendency to over-emphasize German influence makes our author say: "The fructifying influence of German intellectual life resulted in North American transcendentalism, which found in Concord (near Boston) and in Ralph Waldo Emerson its centre, but which flourished only to wither rapidly." Even more strained is the effort to assign to Lincoln a "possibly German ancestry."

—As to our literary celebrities, Dr. Hötzsch is struck with the fact that "no other people has had so many long-lived famous literary men. Such are Washington Irving, Edgar Allan Poe (!), Cooper, Longfellow, Nathaniel Hawthorne, and, above all, the greatest: William Bryant (*sic*), J. Greenleaf Whittier, J. Russell Lowell, and, the most national of all, the whimsically formless pantheist Walt Whitman, a man of the highest sense of individuality and yet thoroughly democratic." Blaine, "honored with the surname of 'the American Bismarck,'" escapes with only the censure that his Pan-American Congress led to no result, while Roosevelt challenges the author's unqualified admiration. Booker Washington, however, elicits his warmest praise. His Atlanta speech, in 1895, is called a "grand turning-point in the history of mankind." It would be easy to point out dozens of historical and geographical errors (Carolina is said to have been named by French Huguenots), but the book, interesting and suggestive as it is, requires not only correction as to statements of fact but, even more, a certain readjustment of perspective, in order to become a thoroughly safe guide to Germans in the study of American history. The publishers, as in the case of all the monographs of this series, have done their part well. The numerous illustrations are for the most part very good, though some, like those of Lee and Longfellow, are not well chosen. The imp of the perverse that is at work in almost every German publication relating to the United States, is responsible for labelling Farragut's picture "General," and Carl Schurz's "Editor of the New York *Staats-Zeitung*," and for locating the Washington Monument in Mount Vernon.

—This week's mail brings the long-feared news of the death of one of the most remarkable scholars of his age. Otto von Böhtlingk, dead at nearly ninety, had seen the origin and growth of the science of language, the whole continuity of Sanskrit scholarship from its earliest beginning; and for over half a century, as member of the Imperial Academy of Russia, had stood foremost among the pioneers of those who opened to the Occident the hitherto unknown wealth of Sanskrit literature. With Roth he began in 1852 the publication of the great Sanskrit dictionary which bears his name. At the age of twenty-five he had already published an edition of Panini, the Sanskrit grammarian, whose work is one of the most technical and difficult of a difficult language. His own activity, like that of his friend Weber, extended over the whole domain of Sanskrit literature. He published a critical edition of Kalidasa's great drama, 'Sakuntala,' a collection of lyric writers, a work on poetics, Upanishads, and critical Vedic studies, besides the inexhaustible thesaurus found in the great lexicon. Almost blind, deaf, scarcely alive, so to speak, he yet, as late as last year, contributed articles on Vedic exegesis to the Saxon Academy. A genial, simple-hearted scholar, he was personally beloved by the many younger scholars who were wont to gather around him. He was the last of that early group of leaders whose working power seems prodigious and almost incredible when one considers under what conditions the work was effected; when the very tools had first to be forged.

HORACE IN ENGLISH.

Horace for English Readers. By E. C. Wickham, D.D. Oxford: At the Clarendon Press; New York: Henry Frowde. 1903. Pp. vi., 363.

There are certain obvious principles which should govern all literary translations. They are grounded either on justice to the reader or on justice to the author, and apply to all languages alike; but they may be summarized, for us, in the apothegm that the best possible translation is that which is as literal as good English and good taste permit. The reason is plain. Without the æsthetically endurable maximum of literalness, injustice is done to the author, who must be supposed to have deliberately chosen his modes of expression, while a servile literalism gives a translation which does not translate and is unfair to author and reader alike. In practice, this general principle must, of course, be developed into particular rules varying with the special nature of the version, whether it be verse, poetic prose, or plain prose; but this one thing is quite plain, that any prose translation, relieved as it is from the trammels of versification, may justly be held to a closer fidelity than a metrical version. Nor is this all. Since every great writer is distinguished by certain marked characteristics—none more so than Horace, whose *curiosa felicitas*, for example, has become proverbial—our rules must safeguard these special traits as much as possible.

With all this, Dr. Wickham in his preface seems to agree. His ideal is "a translation which, while literal in the sense that every thought is exactly represented in its proper order, tone, and emphasis, has also just so much of literary form that it can be read by a modern reader without distress, and understood without perpetual reference to the original." How far his practice agrees with his theory every reader must ultimately judge for himself. We can only say that to us this book is but one more proof that Horace will probably never be thoroughly well translated, even into prose, so long as translators feel bound to avoid, from dread of plagiarism, every happy turn which their predecessors may have hit upon.

What we most miss in Dr. Wickham's versions of the lyrics is a little more of the poetic sense. This lack appears plainly in his misunderstanding of some entire odes. An example meets us at the outset: he conceives I. Ode i. to be "an apology for the composition of Lyric Poetry." We do not require our readers to agree with us that this ode aims to exalt intellectual achievements above what in current phrase we call the strenuous life; but does any reader of poetic taste conceive of the author of "Exegi monumentum" apologizing for lyric poetry, and, of all men, to Mæcenas, the lover and patron of Poetry? Take, again, Ode xii. of the same Book. The "motive" of it is that the authority of Augustus stands next to that of Jove himself. To emphasize this idea, Horace was willing to seem guilty of an "Irish bull" when, in the fifth stanza, he says that nothing is like or second to Jove, but Pallas holds the place next to him. Horace is careful to explain later on that this second place is held in reserve for Augustus (*tu secundo Cæsare regnes*). The translator, apparently blind to this intention, leaves the paradox unexplained when he translates, "Reign thou, with Cæsar for thy vicegerent."

When Dr. Wickham does not misapprehend an entire ode, he often seems blind to subtle beauties. Thus, in I., xi., Leuconoë is warned against "long hopes," meaning, of course, "far-reaching hopes." Dr. Wickham renders this "long day-dreams." In I., ii., Horace offers Octavian, under the figure of Mercury, the name of *pater* and *princeps*, with reference to the title of Father of his Country voted him by the Senate, and to the position of *Princeps Senatus*, which he had wisely preferred to that of dictator. Dr. Wickham's rendering of "princeps" by "first citizen" completely masks all this, without the merit even of historic truth, which would require "first senator." We cannot suppose that Dr. Wickham failed to catch the trite allusion to the "Parthian shot" in I., xix.; but his "Parthian on his flying steed" hardly preserves it. He might at least have said "fleeing." In the intricate IV. Ode iv., the difficulties of which are surmounted with great skill, the version represents the eaglet first as impelled to leave the nest; then as making his first attempts at flight; next as swooping down on the helpless flocks; and, last, as assailing the serpents, which are able to resist him. We have thus, between the first and third steps, the picture of a young bird hopping about near his nest for an indefinite period until, in the quiet breezes of spring, he first learns to fly. Horace makes no such mistake. We are spared the unpoetic image of a half-fledged bird stumbling about like a booby. And all this comes of the intrusion of one unfortunate "then." The translator seems to have mistaken the function of *iam* in verse 9, which belongs, not to the whole sentence, but only to *nimbis remotis* ("when the storms had already cleared"). In I., xviii., Dr. Wickham seems to ignore the familiar rhetorical figure which gives the adjective to the wrong

noun. Instead of rendering *modici munera Liberi* "the moderate bounty of Bacchus," he gives us "the bounty of Bacchus, who loves moderation," which to us is news indeed. Just so he ignores the prolepsis in *verecundum Bacchum*, I., xxvii., which, with equal oblivion of the gay god's peculiarities, he renders "Bacchus the shamefaced." Horace, we think, means "keep him from brawls, and thus, well-behaved." So again, in IV., iii., where "no spirited horse shall draw him in Grecian chariot a victor" stands, by prolepsis, for "speed him to victory," the version says "drag him in Grecian car of victory," *i. e.*, a triumphal car.

Nothing is more characteristic of Horace than his word-painting. His lyrics are full of pictures which he must have seen distinctly while writing. Nothing is more obligatory on his translator than absolute fidelity in reproducing these lyric visions. In I., i., Horace sees the victorious Olympic charioteer return from the race covered with dust (*pulverem collegisse*). His translator represents him as "pleased to have raised a cloud of dust." In I., xiv., the leaking ship needs undergirdling (compare Acts xxvii., 17). Dr. Wickham has, "without ropes the hull can scarcely weather the sea," which would hardly be understood by the average landsman.

Dr. Wickham does not always apprehend the use of adjectives and equivalent clauses as mere epithets. Thus, in I., x., *dives*, "the rich" is a mere epithet, like "white-armed" Juno, "swift-footed" Achilles. It is rendered, "Priam *with his wealth* left Ilium." In II., viii., Cupid has the epithet *ferus* (cruel). Dr. Wickham enlarges it to an adversative clause, "Cupid, for all his fierceness," utterly inconsistent with the context. In IV., i. the epithetal description of Venus as drawn by harnessed swans is taken to refer to what she is expected to do on a particular occasion; and so, in defiance of the lexicon, the passage is rendered "to lead the revel . . . to the house," a version probably based upon the long discarded reading *comitabere* (for *comissabere*), but not justified by it. And again, in III., xviii., the epithet given to Faunus, "lover of the coy nymphs," is ignored as an epithet; and the words *per meos fines*, said of Faunus "marching through my bounds," are made to refer to the nymphs as fleeing through them.

Horace is nothing if not vigorous and terse. His translator shuns brevity. In I., i., Horace's "I shall strike the stars with my uplifted head" is rendered "I shall lift my head till it strikes the stars." The effective *terruit urbem* in I., ii., is drawn out into "has struck panic into Rome." In I., iii., "the labor of Hercules broke through Acheron" is rendered "the barrier of Acheron was broken through; it was a labor of Hercules"—"pretty tough work," as one might say. Our translator does not possess *l'art de ne pas tout dire*. In I., i., *mercator metuens Africum* ("the trader in fear of the Sou'wester") is rendered "the trader with the fear before his eyes of the wind of Africa." The terse *indocilis pauperiem pati* ("untaught to bear poverty") is made into a separate sentence: "To be content without wealth he finds too hard a lesson." So, I., xxvi., *unice securus* ("supremely careless") becomes "I care not, though all the world may care," as if the poet had so much as thought of *unice* as derived from *unicus!* In I., xix., Glycera's face "most perilous to view" *(lubricus aspici)* is served up as "that face to look on which is to slip from your resolve." In IV., ix., Horace's six words, "hidden valor differs little from buried cowardice," are made into eighteen, "when they are in the grave the difference is little between cowardice and valor, if they be hidden." No wonder that Dr. Wickham, in his preface, misses "the lyric cry" in Horace. "Never again shall I burn for another" (IV., xi.) is "never again shall my heart take fire at woman's face." The famous *dulce est desipere in loco* ("sweet is timely folly") stands as "In due place to forget one's wisdom is sweet." In III., xxix., *eripe te moræ*, "shake off delay," is inflated to "the delay is on your side: snatch yourself from it." And so, ode after ode; for we might multiply these examples to weariness.

Infelicities such as making Horace address the male semichorus (I., xxi.) as "my boys," "the yard-*arms* groan" (I., xiv.), are of too frequent occurrence. In IV., ii., 18 *equum* (horse) is rendered "charioteer," where Horace was evidently reminiscent of certain odes of Pindar, as Olymp., I., 29, *seqq.*, in which Pindar sings the praises of victorious horses. Some of these translations seem quite impossible. Thus, in I., iii., *Quem mortis timuit gradum* ("what approach of death did he fear") is rendered "in what degree did he fear death"—a mere platitude, and not to be reconciled with the Latin original. Most surprising is the notorious schoolboy version, "Fortune kinder than a father," in I., vii., where Teucer is hoping that Fortune will be kinder, not than fathers in general, but than his own father, who had forbidden his return to Salamis without his brother Ajax. Dr. Wickham certainly knows that *iam non* is Latin for "no longer." Yet in IV., iv., where Hannibal cries out, in despair at his brother's death, "Never more shall I send proud messages to Carthage," he translates, "Not *to-day* can I send, etc." In IV., xi., 19, *hac luce* is rendered "from its shining." Horace is using *lux* for *dies*, as in II. Sat., vi., 59, a common use of "light" for "day."

With all this murdering of poetry, there is frequently an effort toward poetic expression. In I., i., "near the lullaby of some haunted spring" is poetic, though not faithful. In I., xiii., 15, "hurt the pretty lips" does not seem to us more poetic than the original "wrong those sweet kisses." And yet it seems clear that some of these translations were once in verse. It cannot be mere accident that we read (I., v.):

> "On the heaped roses in some pleasant grot,
> For whose eyes dost thou braid those flaxen locks
> So trim, so simple? Ah, how often shall
> He weep for changèd faith and changèd gods,"
> etc.,

Or, again, in IV., ix.:

> "That you believe not, as mayhap you do,
> The words must needs die which by art till now,"
> etc.

We are far from saying that Dr. Wickham does not sometimes hit upon very neat translations. Certain odes, as II., xvi., I., v., and several in Book IV., are pleasant reading. In IV., iii., 11, the translation of *spissæ nemorum comæ* by "the tangled tresses of the forest" could not well be bettered. We note a curious use of English in III., xxvii., 26, where the sea is spoken of as "seething" with monsters. The original *scatentem* means "teeming."

We have confined our criticism to the Odes. Much the same peculiarities occur in the Satires and Epistles; but they are far less objectionable there than in these delicate lyrics, where the right form of expression is the very soul of the poetry. If the volume contained nothing but the Satires and Epistles, we could find it in our hearts to commend it with very little qualification.

THE CONSPIRACY OF RENNES.

The Plot of the Placards at Rennes, 1802. By Gilbert Augustin-Thierry. Translated by Arthur G. Chater. London: Smith, Elder & Co.; New York: Charles Scribner's Sons. 1903.

Conspirateurs et Gens de Police: Le Complot des Libelles (1802). Par Gilbert Augustin-Thierry. Paris: Armand Colin. 1903.

In noticing this book we must call attention to the fact that its cleverness has received prompt recognition in England. The title of the translation will be found at the head of the present article.

"It is very natural," says J. R. Green in one of his letters, "that the 'pragmatic historians,' working as they do to bring out the actual facts and clear away loose talk, should look jealously at what is in effect a protest against their whole conception of history, and what must look to many of them an attempt to bring the loose talk back again."

We should be glad to know how writers like MM. Langlois and Seignobos regard this little book, which M. Augustin-Thierry has entitled 'Le Complot des Libelles.' Do they regard it as "loose talk," or do they consider it to come within the limits of authentic, respectable history? It certainly represents a departure from the type of historical writing which during the last generation has established itself in France. But, though "unscientific" in form, we must not jump to the conclusion that it has been carelessly prepared. It is learned history made readable by a recourse to all the arts of rhetoric. The French genius apparently revolts from current limitations of style, and looks back with fond regret to days when it was possible for the 'Récits des Temps Mérovingiens' to win admiration and applause.

M. Augustin-Thierry is a man of principle. He has an idea, a theory, a point of departure. Stated in his own words, it is simply this: "Les hommes qui furent nos pères ne sont pas morts tout entiers; leur vie palpite encore dans les archives, et le 'Debout Lazare!' sera toujours la plus noble devise de l'historien." Filled with a belief that the historian should communicate to his pages the thrill of life, M. Augustin-Thierry does not shrink from employing the methods of the psychological novelist. His documents are consigned to the appendix. His text is a piece of literature which employs certain historical facts because they are more romantic than fiction. The publisher's advertisement boldly declares that history thus conceived and treated becomes a resurrection. We shall content ourselves with a more moderate statement. The chapters comprised in this volume have already appeared in the *Revue des Deux Mondes*, and deserve to receive some notice from those who are attracted by the problems of historical composition.

As every one is aware, the closing years of the Consulate were a time of plot and

counterplot. On the one hand, Napoleon is seeking to reap the full fruit of his victories by establishing the Empire; on the other, the Royalists and the débris of the Jacobins are casting about for means to destroy the usurper. M. Augustin-Thierry begins with the great festival which was held on Easter day of 1802 in celebration of the Concordat and the Peace of Amiens. After lavishing his descriptive powers upon the brilliant scene at Notre Dame, he reveals the symptoms of mutiny and discontent that lurked beneath the surface. 'Le Complot des Libelles' is but the first of his studies. Under the general title "Conspirateurs et Gens de Police," he intends to portray all the chief plots that led up to the colossal failure of Cadoudal and Pichegru. Let us hope that Fouché does not prove to be the hero of this romance!

"The Plot of the Posters" is more familiarly known to English readers as the conspiracy of Rennes. It was an affair of minor consequence, but it does not lack dramatic situations. Marbot, who makes it the subject of a whole chapter, states that it was frustrated by a ludicrous mistake. Col. Pinoteau of the Eighty-second Regiment was shaving when he should have been haranguing his troops, and before he could finish the operation he found himself under arrest. Marbot does not shrink from giving details, and his story, despite a few picturesque improbabilities, has been received as accurate upon the whole. M. Augustin-Thierry, however, calls it an amusing and audacious legend which cannot bear examination at any point. In fact, he maintains that Marbot's 'Memoirs' are nothing more than a collection of specious lies. For example, the army of the West did not contain more than 15,000 men at a time when Marbot credits it with being a force of 80,000. But whether M. Augustin-Thierry is correct in his sweeping condemnation, we shall not now stop to inquire.

The gist of the tale can be told briefly, though at the cost of omitting all those details which are so skilfully embroidered with the narrative of M. Augustin-Thierry. In the spring of 1802 the state of San Domingo rendered it necessary that French troops should be sent thither. Bonaparte, prompted by obvious political motives, chose the forces for this undesirable service from the Army of the Rhine, which cherished a good deal of its old republicanism and idolized Moreau. Prior to sailing for the Indies, the troops were quartered in western France, having Rennes for their headquarters. Animated by jealousy of the Army of Italy and looking on Bonaparte as the author of their deportation, the veterans of the Rhine recalled their old ardor for the republican cause and soon found themselves ready to consider the project of a fresh revolution. M. E. Guillon, M. Henri Welschinger, and M. Augustin-Thierry are at one with Marbot in ascribing the ferment at Rennes to the wiles of Bernadotte.

Apart from the grudge which the soldiery had against Bonaparte, on grounds already mentioned, there was a further cause for dissatisfaction. In the days immediately following the Peace of Amiens, he was credited with the intention of ending war altogether and of devoting his energies to the prosecution of a peaceful, constitutional policy at home. How extraordinary this opinion seems in the light of the sequel, we need not say. The essential fact is, that Bernadotte, popular as he was with the rank and file, had little trouble in spreading disaffection. At the same time he lacked courage, and took every step to secure a retreat in case of failure. By deft management he was able to get his plot well launched without signing any documents.

The conspiracy takes its name from the proclamations or posters which were printed for distribution among the troops. The violence of their tone is extreme. In one of them, "An Appeal to the French Armies," the troops are told that they have a country no longer, and that the republic has ceased to exist. Not only is Bonaparte a tyrant, but he instigated the assassination of Kléber and abandoned the army of Egypt to the most shameful miseries. The proclamation reads like a *carmagnole* of Barère. It accuses Bonaparte of having brought back the priests. It asks the generals if they have become the friends of the tyrant. It points to revolution in the clearest terms: "Si vous tardez plus longtemps, la honte et l'infamie seront votre partage; vos noms ne rappelleront plus ces époques glorieuses de nos triomphes; on ne les prodiguera plus qu'aux lâches et aux esclaves!" This proclamation stops short of assassination, but in a second the strain of invective runs higher still. The army is reminded once more of the circumstances under which Bonaparte returned from Egypt: "Soldats, vous le savez, tout déserteur devant l'ennemi est puni de mort—et cependant Bonaparte vit encore."

It is difficult to realize that such inflammatory appeals were printed at the moment when Bonaparte had just concluded a war crowned with the most brilliant successes. M. Augustin-Thierry makes these documents the *nœud vital* of his story, and adduces enough material from the archives of the police to show how the plot arose, developed, and failed. But with the subject we are less concerned than with the style. Here the picturesque is frankly courted by an author whose researches might have justified him in being dull. Even if M. Augustin-Thierry does not succeed in founding a new school of historical composition, he will have made an heroic protest against the bondage of the commonplace.

The Life of John A. Andrew, Governor of Massachusetts, 1861-1865. By Henry Greenleaf Pearson. In 2 vols. Boston: Houghton, Mifflin & Co. 1904.

No one can read this admirably written Life, at last given to the public, of the able and whole-souled patriot once so well known as "the great War Governor," without having called to mind the lines of quaint old Sir Henry Wotton:

> "How happy is he born or taught
> That serveth not another's will;
> Whose armour is his honest thought,
> And simple truth his utmost skill!"

No description of the man could be truer. What an intensely human creature he was! How tender of sorrow, how hearty in rejoicing, how impatient of sloth, how simple, fearless and honest, how willing to give himself, to the very death, for the service of his State and country! One can fancy his scorn of such politicians as we now have in plenty, whose greatest care is to grow fat at the public crib; and yet he was too tender, if anything, of the private sinner, and even retained "a young man whom he had got out of jail" as his official messenger at the State House. His very vanities make one love him, they are so boyish and transparently simple; his indiscretions and impetuosity endear him the more; and, when the last page is reached, he seems so alive and near that one involuntarily exclaims, "Dear old fellow! God bless him!"

John Albion Andrew was born May 31, 1818, in Windham, Maine, where his father kept the village shop and farmed more or less. His mother and father seem to have been, as the old saying has it, "good as gold." The mother was of a sociable and friendly turn, and both traits were inherited by the impulsive and talkative boy, whose "gift of the gab" was apparently almost too much for his family. It was fancied by the neighbors that, as a baby, he was tongue-tied, and an old gentleman "good" for removing such small troubles was sent by them to the house. He declined to try his skill, and the comment, in after years, on his abstention was, "It was lucky that the old gentleman did not cut that boy's tongue, unless to cut a piece off, for if he had, there would have been no living with him!"

A delicate childhood was succeeded by a youth and manhood of fair health, though the tendency to headache and giddiness was probably a warning of the trouble which killed him. Mr. Pearson puts it excellently when he describes him as "a tireless talker, whose personal presence was a constant reminder of the incongruity of even his own seriousness." As a student of Bowdoin College, in 1834, Andrew heard George Thompson, the English Abolitionist, speak, and from that day he "made his abolition vows," and, with all the earnestness of his nature, kept them until the end. In Mr. Pearson's words: "The evil of slavery must be fought; but it must be crushed out, not together with the Constitution, but through the Constitution. Andrew, a descendant of the Puritans, a true Yankee of his own time, with a bent for mixing morals and politics, could not but ally himself with the men whose idealism was well-ballasted"—that is, with the anti-slavery statesmen of his day, rather than with the prophets of a purely moral propaganda, with whose ideals, however, he had always sympathized. When he disappointed his radical friends by his silence, he managed to hold his tongue until he saw that "the hour and the man were baith come," when, indeed, he spoke with no uncertain voice.

In due course Andrew became a lawyer in Boston, and first attracted wide public notice in 1857, when, having been elected as Representative to the Legislature of Massachusetts, he replied to a speech of Caleb Cushing's which practically upheld the Fugitive Slave Law and condemned the Personal Liberty Law. On that occasion, "when he [Andrew] took his seat," says Eben Stone, who was an onlooker, "there was a storm of applause; the radical men had found their prophet. The House was wild with excitement; for a moment the Speaker was unable to preserve order; some members cried for joy; others cheered and waved their handkerchiefs, and threw whatever they could find in the air." From that day, through the time of the

John Brown excitement (when Andrew raised the money for the defence), he became more and more the hope of the Free Soil and Abolition sections of the Republican party, until in August, 1860, in spite of conservative opposition, he was triumphantly nominated for Governor of Massachusetts, to be elected in the following November, and, during the five terrible years which followed, to devote to that office freely and with undaunted courage all that he had in him of life and work.

For the story of those years we gladly refer the reader to Mr. Pearson's book. It tells us of achievements which seem nowadays little short of marvellous. The enlisting and officering of 146,730 men for the army, and approximately 32,000 for the navy, their arming and forwarding, the care of their wives, and later of their widows and children; the hospital service; the jars between the State and Federal authorities incident to getting into running order; the State finances; the coast defence; the national Government and its all too slow march for one of Andrew's make; the fiery appeals to Lincoln to forward the proclamation of emancipation and to authorize the enlistment of colored troops—all this with, incidentally as it were, the endless speechmakings, fair-openings, and celebrations, together with the inspection of all public institutions, prisons, reform schools, insane asylums, the appointment of the Board of State Charities (the first to be established in this country) and its secretary, and the starting of the Massachusetts Institute of Technology, in short, all that belongs to a Governor's duties in time of peace, carried on together with "learning the art of war in three months"—forms a picture of a strenuous life which possibly might appeal even to President Roosevelt. The chapters of the book which deal with the rush of feeling at the opening of the civil war, and the events which followed it, up to the heroic letter of the mother of Col. Shaw and the Governor's grand farewell words to him and his Fifty-fourth Colored Regiment, are those which most move the reader, especially one whose memory reaches back to the time in question; and Mr. Pearson has known how to lighten some of the more serious parts of it with a refreshing sense of humor. Those which treat of the last year of that grimmest of trials necessarily drag a little, showing as they do how the Governor felt more and more the weight of his work and responsibility, and the suffering of his people.

The war over, one of the most striking illustrations of the generous and human side of Andrew comes in a letter of his to the chairman of a Faneuil Hall meeting in 1865, in which, among other things, he discusses the problem of reconstruction in a spirit which should commend him to his Southern brethren. He says: "I deeply deplore the raising of the general question of the suffrage for the colored man in the South as yet. . . . I had hoped the poor negro might have the opportunity of a brief future unprejudiced by being again and immediately the subject of political controversy." In a letter to Sumner also he says: "The master used to be a protection [*i. e.*, to the negro], now the law must supply that protection or he is a necessary victim. But the law also must have a moral support, or it, too, is powerless. . . . Meanwhile, too, we must cultivate all there is of possible good in the Southern people themselves." Again, in his valedictory, as Governor: "Congress may, and ought to, initiate an amendment granting the right to vote for President, Vice-President, and Representatives in Congress, to colored men in all the States, being citizens and able to read, who would, by the laws of the States where they reside, be competent to vote if they were white." Mr. Pearson thus sums up Gov. Andrew's plan of reconstruction:

"The result of all the struggle and sacrifice was that henceforth the term 'United States' must be a noun of singular number. . . . The amendment abolishing slavery needed to be supplemented by another, which should make the franchise a subject not of State but national control, with qualifications to apply to North as well as South, to white as well as black."

With this final protest, in the face of the general feeling, Andrew ended his official life. Two years more were granted him in which to have some time with and for his wife and children. Then he dropped, in harness, as truly killed by the war as though a Southern bullet had been the cause.

We commend this book to all the rising generation of America. They "who knew not Joseph" will be happy if, when the time comes, they can honestly tell their children of men in the public service of the present day as sturdy, uncompromising, and unselfish lovers of righteousness as he whose life it sets before them. If too much space has been given to disputes and differences between Butler and Andrew, and Stanton and Andrew; if the tedious and petty details of such squabbles seem too prominent, and some weaknesses of the hero of the story too apparent, we must remember that no man can stand on the heights always, that behind results lie dry and uninteresting details, and that, with anything short of the conscientious picture given by Mr. Pearson, we could not realize the full force of the persistent and combative qualities which his subject possessed in so marked a degree. Other and minor defects there are, and could hardly fail to be; but without doubt this biography is a true and faithful portrait of a true and faithful man, and confirms the verdict returned by his friend, the late Martin Brimmer, "No man believed in the people more, or truckled to them less."

Overtones: A Book of Musical Temperaments. By James Huneker. Charles Scribner's Sons.

Mr. Huneker's idol is—or was at the time when he prepared this volume for the press—Richard Strauss. His portrait faces the title-page, and to him it is dedicated as "a music-maker of individual style, a supreme master of the orchestra, an anarch of art." Strauss, we are told, as we read page after page with growing astonishment, is not only "the greatest technical master of the orchestra," but he is "the only living issue in music to-day." His is a polyphony "beside which Wagner's is child's play, and Bach's is outrivalled." He is "a psychologist among psychologists, a master of a new and generous culture, a thinker, above all an interpreter of poetic and heroic types of humanity" (namely, Till Eulenspiegel, Don Quixote, and Strauss himself in the "Heldenleben" and "Domestic Symphony")! "No other composer has so nearly approached a musical expression of our time as has Strauss." "In less than an hour he concentrates, relates, makes us see, feel, and hear more than could be seen, heard, or felt in a music-drama enduring six."

What is Richard Strauss in reality? A maker of the dullest, least justifiable kind of programme music, a writer of enigmatic tone-poems, which are supposed to illustrate actual or psychic episodes in the lives of certain persons, or to serve as musical commentaries on abstruse metaphysical themes, but which, even with the aid of elaborate programme notes, leave the hearer in a state of bewilderment which is a sorry substitute for real musical enjoyment. As programme music these tone poems are infinitely inferior from every point of view to such works as Beethoven's "Pastoral" symphony, Raff's "Lenore," Liszt's "Mazeppa," Saint-Saëns's "Phaéton," or Rubinstein's "Ocean" symphony, which do not compel the hearer to fritter away his attention in trying to dovetail the music with the corresponding part in the programme. As absolute music they are equally inferior to the works of other living composers—Grieg, Dvorák, Saint-Saëns, Goldmark, Paderewski, MacDowell; none of these men does Strauss equal as a creator of new melodies, stirring harmonies and modulations, and lovely orchestral tints. As a cacophonist alone does he excel them; but his cacophony, while sometimes characteristic and effective, is too often made an end in itself and insisted on with a morbid perseverance and preference. It is no doubt true that there is a growing tolerance of cacophony in music; but this we owe chiefly to Liszt and Wagner, to whose examples Strauss has added little that is original or important. To make an orchestra bleat like a flock of sheep is not an epoch-making achievement, and to take an orchestra of 108 players to illustrate a day in the composer's life at home shows a surprising lack of a sense of humor.

Kind critics have suggested that perhaps Strauss is really poking fun at the public and the scribes who take his music and his programmes seriously. One cannot help suspecting that Mr. Huneker himself has such an intention in his essay. Those who know him best would not be surprised to have him make, in his next book, a keen and savage onslaught on Richard Strauss. Does he not boldly cite Walt Whitman on his title-page?

> "Do I contradict myself?
> Very well, then, I contradict myself."

In one respect we may agree with our author: Strauss does represent one tendency of the time conspicuously, namely, the tendency to require a bigger orchestra the less one has to say. Given plenty of trombones and saxophones, and the audience will be less likely to note the lack of melody. But Mr. Huneker makes a great mistake in pitting Strauss against the music-drama; for Strauss's chief ambition, in all probability, lies in the opera house. His "Guntram" was a failure, but his "Feuersnot" has proved a success, which will probably encourage his operatic ambition. Truth to tell, such music as he writes is infinitely more in place in the opera house than on the concert stage.

The second chapter of 'Overtones' is de-

voted to "Parsifal," and the seventh to Verdi. Here, again, Mr. Huneker gives utterance to opinions which he himself will probably repudiate some day. Verdi was seventy-four when he wrote his "Otello," an opera admirable in style, but painfully weak on the melodic side, which used to be the composer's chief glory. Yet our author finds that "in its score seethes the passion of middle manhood, the fervors of a flowering maturity. . . . Reversing natural processes, this phenomenal being wrote younger music the older he grew." "Parsifal," on the other hand, we are told, is "the most nonsensical, immoral of operas," "the work of a man who had outlived his genius." "An old man, Wagner had reached the end of his ammunition." Even the Flower Girl music is "a disappointment." In these opinions regarding "Otello" and "Parsifal" Mr. Huneker will find himself in a microscopic minority. He refers to Newman's 'A Study of Wagner' as an epoch-making work; but Newman declares that "to make us feel that 'Parsifal' is in many ways the most wonderful and impressive thing ever done in music—this is surely genius of the highest and rarest kind." Even Dr. Hanslick, Wagner's chief foe, admitted cordially that "a man who can write pieces of the enchanting melodious charm of the Flower Girl scene, and of the energy of the final scene in 'Parsifal,' still has control of a power which his youngest contemporaries may envy him."

Just as Richard Strauss often lugs in dissonances apparently for their own sake, so Mr. Huneker peppers his pages with irritating opinions. These things serve their purpose in newspapers, but hardly seem in place in a book. Fortunately, his latest volume contains several sane chapters, which one can read with enjoyment and profit—chapters in which the author's wit and uncommon gift for "slinging ink" (to use one of the late John Fiske's favorite expressions) can be admired to the full. What he says in his chapter entitled "The Eternal Feminine"—that "the piano girl" is passing—seems too good to be true; but undoubtedly the growing taste for outdoor life and sports has decreased the number of "slaves of the ivory." The author holds that "music, apart from the creative side, is a feminine art," and that "the piano music of the eighteenth century was written for women, is woman's music." But can she play Chopin, can she play other modern masters, as men play them? His answer to this question is somewhat non-committal. Of great interest are several chapters which treat of literary men who loved or understood music—especially Turgeneff, Balzac, Daudet, George Moore. These may pass, but Berlioz noted long ago that "most great poets have no appreciation of music, or only of trivial melodies and childish tunes." Under the head of "The Beethoven of French Prose," we have a consideration of Flaubert and his works, and the final chapter considers "After Wagner—What?" disappointingly, for it brings us back to Richard Strauss.

Shakespeare's Books: A Dissertation on Shakespeare's Reading and the Immediate Sources of his Works. By H. R. D. Anders, B.A. (Univ. of the Cape of Good Hope), Ph.D. (Berlin Univ.). Schriften der Deutschen Shakespeare-Gesellschaft, Band I. Berlin: Georg Reimer. 1904.

Ever since the days of Upton and Whalley, and the vigorous refutation of their views by Dr. Farmer, the question of Shakspere's reading has been a subject of active discussion among the leading students of his works. And, indeed, this branch of Shaksperian study has a decided importance from two points of view: first, for its bearing on the subject of the elements which entered into the poet's intellectual development, and, secondly, as embracing the question of the sources of the individual plays. It is, therefore, gratifying to recognize in the book before us—the first contribution, as far as we know, which South Africa has made to Shaksperian lore—the most thoroughgoing treatise that has as yet been devoted to the determination of just what books, tales, songs, etc., Shakspere actually read, as far as the closest investigation of his works permits us to judge. In a field where, so to speak, the whole world has been at work, we could hardly expect of the author any startling finds, but he has collected here from the most widely separated quarters all that has been brought to light in regard to the poet's reading, and, generally speaking, he has sifted with conservatism and good judgment the materials with which he has had to deal.

In the vexed question of Shakspere's classical learning he has happily yielded to the tendency, very marked of recent years, to give a more liberal interpretation to the first clause, at least, of Ben Jonson's famous phrase about the poet's "little Latin and less Greek." On the other hand, Dr. Anders has justly declined to be caught by the tempting suggestion which the late James Russell Lowell threw out, and which Mr. Churton Collins has recently elaborated, to the effect that Shakspere attained a certain knowledge of the Greek tragedians through the Latin translations of their works which often accompanied the original texts in the sixteenth-century editions. Mr. Collins's articles have given a new start to discovery, it would seem, in the domain of Shakspere's reading—witness the attempt of Sir Edward Sullivan in the February *Nineteenth Century* to fix in the list of the poet's books the 'Civil Conversation' of Guazzo—but few readers will acknowledge more than accidental resemblances in the parallel passages which he has so abundantly adduced. Indeed, it is obviously unlikely that the poet, who displays only the most meagre acquaintance with Latin poets of the first rank, like Virgil and Horace, should be painfully seeking a knowledge of the Greek tragic writers through a medium which, it is safe to say, not even professional scholars have ever found anything but a bore.

After giving a very full and interesting survey of the books through which Shakspere as a Stratford schoolboy would have to make his progress, and adding a discussion of his relation to the individual classical authors, the writer takes up in succession the evidences of the poet's reading in the literatures of the Continent (in the modern period), in the literature of his own country, both dramatic and non-dramatic, and in the general literature of ballads, songs, popular tales and jest-books. The study closes with a discussion of Shakspere's knowledge of the Bible and Prayer Book, and a chapter on his "Heaven and Earth"—that is to say, the current notions of the time in the realms of astronomy and geography which have entered into and influenced his works. All of these chapters are very carefully done, erring, if anything, on the side of too great fulness, and we have few criticisms to make.

The most obvious criticism applies to the section in which Shakspere's debt to Marlowe is discussed, and in a less degree to the section on Samuel Daniel. Here the writer shows that he has contracted something of the disease which almost invariably afflicts investigators of sources—namely, that of discovering parallels in every nook and corner. It is absurd, for instance, to characterize as "echoes of Marlowe's poem" the most general allusions to the legend of Hero and Leander in Shakspere's plays. This fault, however, vitiates the whole section on Marlowe as well as the section on Daniel, where, moreover, the false light of Dr. Ewig aids in leading the writer astray. It strikes one, again, as remarkable that Dr. Anders should cite indifferently as Shakspere's everything that is traditionally included in the editions of his works. Thus, no distinction is attempted between Shaksperian and non-Shaksperian parts of plays like "Taming of the Shrew" and "Timon of Athens"; and the "First Part of Henry VI.," as far as citations go, is accepted as unhesitatingly into the Shaksperian canon as "Othello" or "Macbeth." Indeed, the author has unconsciously supplied an argument of real weight against the authenticity of disputed plays like "Titus Andronicus" and the "First Part of Henry VI.," for we do not think that any one can fail to be struck with the far greater numerical evidences of reading in these plays than in those which are undoubtedly from Shakspere's own hand.

In addition to the above, some corrections and criticisms in detail might be made. For instance, one might ask what reason has Dr. Anders for supposing that the tragical conclusion to "King Lear" was derived from some hypothetical earlier version of the story instead of being of Shakspere's own invention. Furthermore, there can be no doubt that the lines in "Much Ado about Nothing," II., i., 205-6, do refer to the story of the blind man who was robbed by the boy. Shakspere did not have to be acquainted with 'Lazarillo de Tormes' to know this story, for, as M. Jusserand pointed out several years ago in his 'English Wayfaring Life in the Middle Ages,' a miniature in one of the Royal manuscripts of the British Museum attests its existence centuries before the composition of the Spanish romance. In taking leave, however, of this book we gladly bear testimony to the care which has been expended on it and the value of the result. It only remains to be remarked of the style that it has somehow a decidedly foreign flavor, although there are only one or two actual lapses from English idiom in the whole book. As an example of the latter, it is pleasant to observe that the author has reconciled the long-conflicting claims of "standpoint" and "point of view" by an ingenious combination of the two into a new phrase, viz., "standpoint of view."

Editori e Autori: Studi e Passatempi di un Libraio (Piero Barbèra). Florence: G. Barbèra. 1904.

This modest collection of studies and occasional papers is a significant contribution to the history of printers and printing. The author is the present head of the famous Florence publishing-house still bearing its founder's name; and his filial regard for Gaspero Barbèra, manifested throughout, finds especial vent in the painful chapter on the last years of that sturdy character. Here is reproduced Signor Barbèra's report of his observations of the printer's art in this country in 1892, already given to the public, as our readers were made aware at the time; and a corresponding journey to Argentina five years ago furnishes an agreeable and instructive pendant. In the South American republic the great number of Italians engaged in printing establishments of course fixed the attention of our author; but apart from this he was evidently much impressed by the magnitude of certain plants, lithographic and chalcographic more than typographic (as in connection with the match-box industry), and by the prospects of the thriving Plate country. Another paper deals very sensibly with the relations between author and publisher, the risks and profits of the one, the royalty of the other; the expense and annoyance caused in the printing-house by such conscienceless proof-slashers as Alfieri, Ugo Foscolo, and Balzac, and in Italy by the bad habit of putting a work in hand before the author has completed it. A review of the progress of typography is centred upon the development of the printing-press; that (still of wood) used by G. Bodoni, the paragon of modern Italian craftsmen, differing little from Gutenberg's. Koenig, the inventor of the cylinder, figures largely, along with his courageous backer, John Walter of the London *Times*. Robert Hoe also comes of necessity upon the stage. Signor Barbèra's description of DeVinne's processes led one of his countrymen to devise an improved contrivance for facilitating binding. Our author does not regard the linotype as the last word in mechanical composition. In a footnote he welcomes the monotype as very near his idea.

A patriotic discussion of the press and the Italian *Risorgimento*, with its enumeration of liberal presses and publications and pamphleteers in the reactionary days of Italy "a geographical expression," binds together the preceding biographies which are the solid title of this work to esteem and preservation. Passing over the introductory academic, if sympathetic, parallel of Cola Montano and Étienne Dolet, the humanistic printers of the Renaissance, we have a quarter of the volume devoted to the striking career of Nicolò Bettoni (1770-1842), the proprietor of printing-houses, some nobly adorned, in five Northern cities, the publisher of five million volumes of the best Italian literature, a not mean writer, passing from disaster to disaster, yet always paying his workmen promptly, and scrupulous to discharge his debts as soon as he was able; and nevertheless forgotten by the dictionary makers. Signor Barbèra throws light upon his unhappy difference with Foscolo, who does not shine as friend or client. Bettoni also made the first advance towards the cylinder press with his *Vite-et-bien* improvement. His mark was an eagle, sometimes holding in its beak a medallion of Franklin, with the motto *Eripuit cœlo*, etc. Another worthy resuscitated is the Hebrew David Passigli (1783-1857), a most careful printer, who enriched his publications with original and truly artistic illustrations. These included Manuzzi's Dictionary of the Italian Language and Scifoni's Universal Biographical Dictionary. More important still, he employed as foreman the future great publisher Félix Le Monnier, who in turn bred to the business Gaspero Barbèra.

Vincenzo Battelli (1786-1858) was another artistic printer, who housed his factory ornately. He was himself a colorist and aquarellist. By popular subscription he provided the funds for filling Vasari's niches in the Uffizi with statues of the most illustrious Tuscans, as the architect had contemplated. Battelli's vicissitudes were akin to those of Bettoni and Passigli. There remains to mention Paolo Galeati of Imola, "the last of the classics," a wise continuer of Bodoni in fine printing, a potent friend of free speech in the interest of Italian revolution. Any one interested both in Italy and in the printer's art will be repaid for reading these altogether praiseworthy "Studies and Diversions."

Problems of the Present South. By Edgar Gardner Murphy. The Macmillan Co. 1904.

In all ages, human beings, when living in isolated communities, have been apt to believe their own to be the centre of the universe, and themselves to be possessed of all virtue and wisdom, and, with the Chinese of other days, to regard the outside world as "foreign devils." When light breaks in on such a community, what a welcome it should receive! Mr. Murphy's little volume deserves to be read by all thoughtful Americans, expressing as it does, for almost the first time in the South, the feeling that it will not do for any portion of the country to remain in darkness.

The author, always from an intelligent Southern point of view, discusses the question still the most vexed with which the country has to deal; and when it is said that he would welcome the decent and educated negro as a voter, it will be conceived how refreshingly his views contrast with the sentiments of a Vardaman or a Tillman, and how hopefully he shows that there is in truth a New South which those demagogues cannot muzzle. On one point, however, we should be glad to have Mr. Murphy give less questionable grounds for the optimism which pervades his book. He tells us that the law which gives the vote to illiterate whites and withholds it from all men of African descent (unless they can prove to a board of white registrars that they are sufficiently educated) is operative only "for a brief fixed period." But who, we would ask, is to guarantee that "the unqualified white men," who, as he says, have been "included in the partnership of reorganization" because "they held the key of the political situation," will quit their hold? "He who has but small esteem, husbands that little carefully," and those who have hitherto had the satisfaction of looking down on a class just below them will surely fight tooth and nail against the progressive and liberal men of the South, whom Mr. Murphy represents, in order that the color line may be kept as hard and fast as ever.

That Mr. Murphy is still under the delusion that what he calls the "social sanctity of the table" in the South differs materially from that in the North, and that he implies that either can be threatened by one's asking an educated and cultivated fellow-citizen with a darker skin than his own to take a meal at it, may well be excused, especially as his views are much more delicately and tactfully given than has been usual with those who have hitherto approached the subject. In short, if every white Southerner were as temperate, sensible and just as the author of the 'The Present South,' we should have no fear for "The South of the Future." But, while there is in many of its States such a fearful percentage of illiterate blacks and whites as that of which he tells us, we cannot but feel as much alarm at the prospect as that caused us by the percentage, in the North, of ignorant and bribable voters, who form the chief reliance of Tammany in New York and Quay in Philadelphia.

Highways and Byways in Sussex. By E. V. Lucas. The Macmillan Co. 1904.

The latest volume of this charming series deals with a county which, except along its coast, is little explored by the American visitor to England. For most people, in fact, Sussex is, as Mr. Kipling calls it, "Sussex by the sea." Yet Brighton, Eastbourne, and the rest of those cosmopolitan and democratic resorts have nothing to do with the Sussex of which Mr. Belloc wrote his poem, proving, like Mr. Kipling, that one need not be born in the county to be inspired with its fervent local patriotism:

> "I never get between the pines
> But I smell the Sussex air,
> Nor I never come on a belt of sand
> But my home is there;
> And along the sky the line of the Downs
> So noble and so bare."

The great hills of the south country, the Downs, lie between the towns of the coast and the Weald in the north, almost undiscovered country, "the symbol of Sussex." At their highest no more than eight hundred feet, they are great swells and billows rather than hills, and give a sense of repose with their gentle outlines. On their highest points are the barrows of the early Britons, and there the Romans made their camps, and, leading from them, those mysterious sunken paths, still existing, by which the legionaries could drop unseen upon the terrified Britons in the Weald below. At Bignor the Romans built a villa, which must have covered some acres, the home of some Roman colonial governor; with its pavements and hot-air pipes nearly two thousand years old, a vivid token of Roman occupation. Englishmen never forget that Cæsar landed at Deal, and William the Norman at Pevensey; the unprotected Sussex coast has been the nightmare of many a statesman. One must go to Sussex to realize that the Romans actually stayed in England over four hundred years.

After the Roman, came the Saxon, and made Sussex his own in spite of the Norman conquest; the Sussex dialect is mainly Saxon, as are the field names and the character of the peasants. Sussex is traditionally the "silly" county, as Cumberland is the "canny," and its patriotic historians pride them-

selves on its large preserve of fallow brains, and quote Renan's assertion of his debt to the solid Breton stupidity of his ancestors. So, too, the Greeks found reserves of strength in slow-witted Bœotia. Cricket is a good index of the character of a county, Sussex, not famous for effort in other pursuits, is supposed to be no good at "staying a rot." There are no people more conservative; a visitor from another county is a "foreigner"—only the men of Sussex are allowed to be "English." A tale told by Mr. Lucas illustrates how completely the inhabitants are out of the movement. A Sussex man who found himself in London for the first time, exclaimed with astonishment: "What a queer large place! Why, it ain't like Newick and it ain't like Chailey." Forty years ago Mr. Lower prepared for Prince Lucien Bonaparte a Sussex version of the "Song of Solomon." Mr. Lucas gives one chapter from this curiosity of literature, invaluable to the student of local English dialects and vagaries of pronunciation. It is interesting to note that Penn took with him two hundred colonists from Sussex. But it is in New England rather than in Pennsylvania that one finds Sussex words; the Sussex man "guesses" and "reckons," calls autumn "the fall," and "disremembers" like Huck Finn.

Sussex is full of places with a past, like Tunbridge Wells, of fine old haunted manor-houses, of picturesque legends of smugglers and highwaymen hanged in chains. It was once a great iron county, and produced the first English cannon in the days of which Thomas Fuller says that "ingenuity crossed her hands" when a monk founded the first cannon while a soldier was inventing printing. The literary associations of Sussex are rather modern; Mr. Kipling lives at Burwash, Mr. Henry James at Rye; Richard Jefferies wrote in his essays some of the best descriptions of Sussex scenery. This is all imported talent, and few of the natives have expressed the essential feeling of those whose home is in the county as directly as Mr. Kipling:

> "God gave all men all earth to love,
> But since man's heart is small,
> Ordains for each one spot shall prove
> Beloved over all.
> Each to his choice, and I rejoice
> The lot has fallen to me
> In a fair ground—in a fair ground—
> Yea, Sussex by the sea!"

Mr. Lucas, the editor of Charles Lamb, writes in a vivacious semi-antiquarian style which is admirably suited to the series. The illustrations by Mr. Frederick L. Griggs are numerous and attractive.

The Modern Bank. By Amos Kidder Fiske. D. Appleton & Co. 1904.

Many books have been written on banking; and, we must admit, many that are easier reading than this. Adam Smith explained some of the leading principles of the subject in a manner that has never been improved upon, and Bagehot's brilliant essays will always hold their place as an incomparable exposition of the forces which operate in the money market. Mr. Fiske's aim is different. He proposes to exhibit the actual course of business in a modern bank in all its details. He describes the statutory organization, the physical equipment of vaults and safes and cages, of books and records and securities and cash. He enumerates the officers and the employees, and explains minutely their respective duties. He shows us how the business of the day begins, and how it proceeds through its infinity of technical details until the books are balanced at the close of a period of as concentrated attention as is required in any calling in the world. Nothing is omitted. With the aid of this book one ignorant of the elements of banking might enter one of our modern institutions and comprehend its whole mechanism without asking a question. Possibly many of those actually engaged in the work might learn particulars to which they had never before given thought.

In tracing these details, Mr. Fiske has proceeded with the most conscientious accuracy. His observations were carried on with the aid of very competent experts, and his results have been submitted to the best of critics. It is doubtful if a misstatement of fact is to be found in the work. As we have intimated, it is not easy reading; nor perhaps could one so constructed be of a "popular" character. The business of banking, from this point of view, is mechanical; much of it is actually carried on by machines—we might almost say of much of it that the more nearly the men engaged act like machines, the better. It is a routine, in the main, and the more precisely the established methods are followed, the smoother does the whole mechanism proceed. Regularity is the cardinal virtue of the bank clerk. Whatever is unusual or unprecedented is felt, as a clock feels the intrusion of a particle of dust, and produces hesitation, caution, or even disorder. The effect of this accumulation of detail, if wearisome, is impressive. The machinery is amazing in its complexity and in its perfection. It is to some extent the product of legislation; many things have to be done because the law commands them, not because they are essential. But, on the whole, the modern bank is a beautiful example of the development of a human institution in response to the continually enlarging demands of industry.

In view of the stiffness of the task set by Mr. Fiske for his readers, it might have been well to infuse a little more of the personal element. It is not an unreasonable curiosity for a young man to wish to know the compensation which clerks and tellers receive for their severe labors, and how long they must serve before promotion. It would be less reasonable to ask Mr. Fiske to undertake what lies beyond his present scope, and to discuss questions which must some day be decided, such as the basis of circulating notes. On such questions his opinion would be of weight, and we must regret that the limits of his work, and perhaps his own modesty, have not allowed him to express it. We cannot but regard it, however, as a mistake to give no account of the taxation of banks—a matter which every banker must consider. At the foot of page 134 the omission of a negative destroys the meaning of a sentence; and the statement on page 255 that banks were first instituted for the safe-keeping of valuables, conflicts with that on page 261, that the first banks were agencies for managing Government loans. The chapters on the great banks of other countries are remarkable for the amount of information which they condense—information which is, perhaps, nowhere else presented in so convenient and available a form. Mr. Fiske certainly deserves high praise for the painstaking fidelity with which he has carried out a very laborious undertaking.

Matthew Arnold and his Relation to the Thought of Our Time: An Appreciation and a Criticism. By William Harbutt Dawson. G. P. Putnam's Sons. 1904.

There is to-day, Mr. Dawson says in his preface, "a cult of Matthew Arnold," which must grow, "because many tendencies of the age are in its favor"; still more "because many influences are opposed to it," and "because the healthiest instincts of human nature and the deepest interests of civilization require that it shall combat these opposing influences and overcome them." The object of this book is to show what this cult is, and why it must prevail. Briefly, it is that of *idealism*, using the word in the sense of the pursuit of perfection. Of this pursuit Arnold was the poet, the expounder, and the preacher. This idealism attracts, however, "by virtue of its very soberness and sanity, attracts because it appeals to no phantom of the imagination, presumes no conditions unattainable in the actual life of mankind, but, taking human nature as it is, recognizing its rigid limitations no less than its vast possibilities, presents for acceptance a discipline of thought and a scheme of conduct both worthy and inspiring, and that the more since they carry the sanction of his own experience." This is well said, but it reminds us at the same time how difficult it is to sum up in a few words what Matthew Arnold has been, and is, to those who have come under his influence.

The book as a whole is a very fair restatement of everything that Arnold had to say to the world, but does not deal with him directly as a poet. It is divided into three parts, Culture, Religion, and Politics, and it would be a waste of time to discuss it in detail. The question which it suggests is how far it is true that we may look forward to an increasing Arnold cult. The author's idea evidently is that Arnold's philosophy will now loom larger than ever on the intellectual horizon because it is the antithesis of the "strenuous" creed. The difficulty here, however, is that although the idea of the strenuous life would not have commended itself to Arnold any more than to Marcus Aurelius, Arnold belonged to his own time and aimed the shafts of his wit at the contemporary enemies of culture. His delightful banter and satire were deadly to the Philistinism in English society as it existed about him; but a different epoch has succeeded, and his generation is gone. The Philistines of to-day, too, masquerade as children of light, and vouch for themselves as apostles of culture. All this is confusing. It is easier, perhaps, now to read Arnold as a classic than to set up a cult of him with a practical view to the immediate intellectual or moral struggle of our time.

But, cult or no cult, he cannot have too many faithful adherents or admirers. Poet, satirist, philosopher, teacher, he stands out amid the bustle and vulgarity of the latter half of the nineteenth century, a remarkable figure in bold relief. Disraeli expressed approval of him because he "launched phrases"; Gladstone complained that his Christianity was an invention; the Philis-

tines misunderstood him, and the Barbarians certainly resented him. But he held to his course as few men have ever succeeded in doing, and he is already among the masters, while we are still wondering as to many of the conspicuous figures of his day whether they were great men or only great impostors.

Recent Excavations in the Roman Forum, 1898-1904. By E. Burton-Brown. Scribner. 1904.

How greatly the aspect of the Roman Forum has changed during the last six years few can realize who have not studied the recent excavations carefully, either on the spot, or by means of photographs and accurate descriptions. No period of equal length in all the history of excavations in Rome has yielded such varied and important historical and archæological results, and none has in so many details altered the appearance of a familiar area. Critical and technical accounts of these discoveries as a whole have been issued in the *Notizie degli Scavi* by Comm. Boni, who has conducted the excavations with such great wisdom and care, in the *Bullettino Comunale* by Prof. Dante Vaglieri, and in the *Römische Mittheilungen* by Prof. Chr. Hülsen, who is of all men living the one most qualified to speak with critical authority of all matters connected with Roman topography. Briefer summaries have been printed in the *Classical Review* by Mr. Thomas Ashby; but, for a connected description in English, suited to the reading of the ordinary traveller, we have to thank Mrs. E. Burton-Brown (a first classic of Girton, if we mistake not).

Hers is a pretty and readable little book, with good photographic illustrations and suitable plans. The advertised preface by Boni is naught, but his authority has been followed with marked closeness, not merely for facts, but also for their interpretation. When we are told that within a depth of about thirteen feet of soil and débris on the Comitium the existence of twenty-three distinct geologic and archæologic strata has been definitely determined, and that the "magnetic inclination" (whatever that may mean) of the earlier burial-urns in the newly discovered necropolis near the temple of Antoninus and Faustina establishes their precise date as the thirteenth century B. C., we must be pardoned for wondering if archæology is not running a wee bit awry. Nor can we believe that the circle of columns that supported the domed roof of Vesta's temple in its imperial restoration finds its prototype, not in Greek architecture, but in the multiplication of the door-jambs of the prehistoric Italian hut-urn. The writer sometimes "contaminates" her authorities curiously. She gives us Middleton on methods of Roman construction, and he perpetuates the Vitruvian confusion of wall-facing with wall-structure, and talks of wall-facing in *opus incertum*, even as others, who cannot point to actual examples of such a wall-facing in Rome. But certain of Mrs. Burton-Brown's authorities are accustomed to speak (and correctly) of various forms of concrete as *opus incertum*, and therefore her account furnishes us with a dozen instances of *opus incertum* as a wall-facing in the Forum itself. Indeed, indications of a lack of thorough classical and archæological grounding on the part of the writer are evident throughout the book, though they will not seriously impair its usefulness for those for whom it was designed.

Many small points need correction. The following are but samples: Gaius, not Caius, is the proper form of the Roman name; Volsci, not Volsces, were sometime enemies of Rome; the play of Plautus is "Curculio," not Curculius, and the Forum the *locus oculatissimus* of the whole city, not *oculantissimus*. The Roman proverb spoke of washing a brick, not of washing brick walls; "Q. St. D. F." is not the *name* of a Roman festival; the Pontifex Maximus was by no means "the head of all the priesthoods" in the same sense in which he exercised paternal authority over the Vestals; and the *præses* of a province was more than a mere "magistrate" in it. "Perpendicular" is not a synonym for "vertical"; the church near Pompey's theatre is S. Andrea della Valle; the inscription to L. Cæsar found near the Basilica Æmilia commemorates him as "princeps iuuentutis" (and his augurship should be mentioned in the translation of it); the tribunal of Plin. Ep. VI., 33, was in the Basilica Iulia, not in the Forum; nor can a fire be said to have "burned in uninterrupted connection with mother earth" when it was ten or fifteen feet above her bosom, even if it were likely that only the fire-grate intervened between them.

Life of General Philip Schuyler, 1733-1804. By Bayard Tuckerman. Dodd, Mead & Company. 1903. Pp. 277.

In a brief preface Mr. Tuckerman informs us that "this memoir is based on General Schuyler's papers and letter-books, on the Gates papers, . . . on the archives of the State department in Washington, and on some other collections of original historical material." It would have been interesting to know what these "other collections" were, but one must needs be content with this description, for no other or further bibliography is vouchsafed and no specific reference to any original authority is made. It is, consequently, difficult to determine whether Mr. Tuckerman has examined all the sources, or whether he has used satisfactorily such as have been examined. It appears, however, that he has been mainly interested in the military career of Schuyler; much space has been devoted to the rivalry between Schuyler and Gates, and the Gates papers (one may guess) have been used here to good purpose.

Mr. Tuckerman sympathizes with Schuyler and wholly exonerates him, yet he presents the case impartially, and even without much zest. His position is that Schuyler's conduct was patriotic and efficient without being brilliant, and that his retirement was the result of New England prejudice and the intrigues of Gates. Schuyler's connection with the New Hampshire grants dispute, small as it was; his acceptance of Johnson's parole, which was broken; the necessary (as Mr. Tuckerman thinks) evacuation of Ticonderoga; and probably a manner natural enough to a member of the New York "aristocracy"—these were the facts which aroused and kept alive the opposition to Schuyler in New England. This opposition might have been overcome, or lived down, had it not been for Gates, who, as Mr. Tuckerman makes quite clear, was deliberately making use of the New England feeling to get himself appointed in Schuyler's place, which he finally succeeded in doing. Mr. Tuckerman's summary of this unfortunate episode is just: "The retirement of Schuyler was an error excusable under the circumstances. But the choice of his successor was a great mistake" (p. 231).

Dwelling on the military career of Schuyler has left the author little space for his post-Revolutionary services, which are dispatched in twenty-four pages. If, in a life of Schuyler based upon the sources, one might have expected to get some facts about the origin of the Federalist party, or to have old facts treated originally, Mr. Tuckerman's exhibition will prove a disappointment. True, the correspondence between Schuyler and Hamilton of most value, from this point of view, was destroyed; yet the treatment of these last years is certainly unfortunately brief and irritatingly conventional. Somewhat more space has been given to the early years of Schuyler and to the environment in which he grew to manhood; the double character of Schuyler's position—at the same time landed aristocrat and frontiersman—is properly emphasized. On the other hand, minor errors are rather too frequent. "Corlear" personifies the inhabitants of Albany at page 11, but the Governor of New York at page 27. The New York Assembly was not chosen "by freeholders only," and it is misleading to say that it "sat for seven years" (p. 76). The impression one gets from page 76 is that the Assembly of 1768 was the last Assembly of the colonial period. It is implied that the Sons of Liberty were organized as early as November, 1765 (p. 77). This is a common misconception for which, so far as we are aware, there is no evidence. The conciliatory policy of Moore was not the only or the principal cause of the reactionary tendency which set in after the Stamp Act trouble (p. 80). It is assumed that the Conservative party, which in 1774 occupied a middle ground between Loyalists and Radicals, was composed exclusively of men who finally supported the Revolution (p. 82). In fact, the Conservatives split in two—some became Revolutionists, some Loyalists. The index is poor. The book is attractively printed and bound.

Essays and Addresses, 1900-1903. By the Right Hon. Lord Avebury. The Macmillan Co. 1903.

Anything said or written by Lord Avebury (better known to the public as Sir John Lubbock) has always commanded attention. A book like this, dealing with a wide diversity of topics, gives us the means of gauging the nature of his authority—an authority long established with a large circle of readers, both here and in his own country. It is not that of the specialist, though we believe that in one field he stands as an original discoverer; it is not so much that his work has helped to "popularize" science, though he has done his share of this; but that, in whatever he treats, whether it be related to science or not, whether it be Huxley's Work, or Bank Holidays, or Education, or Municipal Trading (to take a few of the titles in the present collection of miscellanies), he employs with remarkable success a method so rational, so lucid, so disinterested, that it gives him a position apart. It is to the voice of

Truth we listen—not Truth militant, but Truth expository. Whether it is the Pleasures of Life which are under analysis, or the Fiscal Policy of England, we are equally convinced. Now, given this method as applied to a single branch of science, to science itself, to a thousand subjects of common interest, political, social, and moral, and you have a type of writer or public instructor who stands by himself. It is not the type of Darwin or Faraday, but of one who, having mastered the true *organum* of investigation, shows how it may be applied to everything human, or at least to everything human that will stand it. Pure literature does not come within this category, and hence when we come to Ruskin and Richard Jefferies Lord Avebury is least at home.

In reading him, what we wonder at, apart from his treatment of the special matter in hand, is his remarkable equipment for his task. He does, to be sure, betray sometimes a solemnity which leads the reader to suspect a congenital lack of humor. For instance, after mentioning a joke about Jefferies to the effect that his first and only friendship was with "the man in the tumulus" (*i. e.*, the remains of an ancient chief buried there), he thinks it best to warn his hearers that this was an "exaggeration." But, as we have said, this is not his field. In the present volume, the two noticeable essays on the Position of British Commerce and Our Fiscal Policy are new, and all the more interesting because they were written before Mr. Chamberlain's recent speeches.

In what we have said, it must not be supposed that we have desired even to suggest an estimate of Lord Avebury as a contributor to science strictly so called. The present volume does not invite it. In these pages we meet the accomplished savant at home in widely different fields, and deeply versed in important public questions. Pervading it all there is something individual —a serene and lucid honesty of mind and purpose, which may not be genius, but is akin to it, and perhaps equally rare.

BOOKS OF THE WEEK.

The Most Interesting and Important Book of 1904

An Autobiography by Herbert Spencer

"Beyond any reasonable doubt it is destined to take rank as one of the two or three most remarkable self-portrayals of a human life ever committed to posterity."—*Franklin H. Giddings, LL.D., in The Independent.*

"It is rich in suggestion and observation, of wide significance and appeal in the sincerity, the frankness, the lovableness of its human note."
—*New York Mail and Express.*

"As interesting as fiction? There never was a novel so interesting as Herbert Spencer's 'An Autobiography.' There is hardly a phase of intellectual or social life on which he does not make remarks that are brilliant or entertaining or original."—*New York Herald.*

"What strikes one first, as he is here revealed, is the immense humanness of the man, his varied interests—these and his candor, his anxious desire to look himself squarely in the face, to see himself as he really is."
—*New York Evening Telegram.*

"It is rare, indeed, that a man who has so profoundly influenced the intellectual development of his age and generation has found time to record the history of his own life. And this Mr. Spencer has done so simply, so frankly, and with such obvious truth, that it is not surprising that Huxley is reported as having said, after reading it in manuscript, that it reminded him of the 'Confessions' of Rousseau, freed from every objectionable taint."
—*New York Globe.*

"The book, as a whole, makes Spencer's personality a reality for us, where heretofore it has been vaguer than his philosophical abstractions."
—*John White Chadwick in Current Literature.*

"In all the literature of its class there is nothing like it. It bears the same relationship to autobiographical productions as Boswell's 'Life of Johnson' bears to biographies."—*Philadelphia Press.*

"This book will always be of importance, for, though the influence of Herbert Spencer seems to be waning, he was a great and original thinker, and his system of philosophy, whether it stands or falls, has bent the thought of a generation, and will keep a position of commanding interest."
—*Joseph O'Connor in the New York Times.*

"Planned and wrought for the purpose of tracing the events of his life and the growth of his opinions, his autobiography does much more than that. It furnished us, half unconsciously no doubt, a more vivid portraiture of his peculiarities than any outsider could possibly provide. We pity his official biographer! Little can be left for him. Here we have Spencer in habit as he was."
—*New York Evening Post.*

With illustrations. Many of them from the author's own drawings. Cloth, 8vo. Gilt top, 2 vols. in a box, $5.50 net. Postage, 40 cents additional.

Harvard Medical School, 688 Boylston St., Boston, Mass.

Lasell Seminary
AUBURNDALE, MASS.

A school of the first class for young women. Gives thorough training in a liberal arts course planned wholly for young women adding its specialty of Household Economics. Boston Masters in Music and Art. Annex department of household practice a decided success. For catalogue, address
C. C. BRAGDON, Principal.

ROCK RIDGE HALL

A School for Boys. Location high and dry. Laboratories. Shop for Mechanic Arts. A new gymnasium. *Strong teachers. Earnest boys.* Scholarships. A vigorous school life. American ideals. Illustrated pamphlet sent free.
Dr. G. R. WHITE, Principal, Wellesley Hills, Mass.

Teachers, etc.

A LADY WHO HAS LIVED MUCH in Europe, will exchange her thorough knowledge of travel in England and on the continent for three or four months in Europe, she assuming responsibility as to all arrangements. Highest references given and required. Address H., care of *Nation.*

COLLEGE INSTRUCTOR,
Man, wants tutoring during summer.
Preparation for college, classics, English, mathematics; assistance in other subjects. East or West.
Address M. R., care *Nation.*

LITERARY OCCUPATION Wanted by highly educated gentleman having traveled extensively; well acquainted with the French, German, Italian, and Spanish languages.
Address
P. Q., care *Nation.*

A Ph.D. OF A GREAT EUROPEAN University seeks a desirable position in Romance Languages. Can also teach German. Eight years' experience in teaching, and excellent references. Address AMERICAN, care of *Nation.*

WANTED.
The Statesmen's Year Book for 1902 and 1903
Address, stating price, H. C. WOOD, P. O. Box 794, New York City.

Fisher's Outlines of Universal History—Revised Edition

$2.40

By GEORGE PARK FISHER, D.D., LL.D., Professor in Yale University. Also in three parts. Price, $1.00 each.

A CAREFUL revision of this well-known work, including whatever amendments are called for by recent historical investigation. The bibliography connected with the successive periods has been modified to meet present needs. The history has been brought down to the beginning of the twentieth century. It should be in every library.

"THE FOUR-TRACK SERIES"

This is the title of a series of books of travel and education issued by the Passenger Department of the

NEW YORK CENTRAL & HUDSON RIVER RAILROAD.

These small books are filled with information regarding the best modes of travel and the education that can best be obtained by travel.

They relate specifically to the great resorts of America—to trips to the islands of the sea and around the world.

They also contain numerous illustrations and new and accurate maps of the country described.

A copy of the 52-page Illustrated Catalogue of the "Four-Track Series" will be sent free upon receipt of two-cent stamp, by George H. Daniels, General Passenger Agent, New York Central & Hudson River Railroad, Grand Central Station, New York.

EUROPE. One or two vacancies in small party of ladies; sailing May 14th for Naples. Four months' tour. Address MISS BARBOUR, 29 East 29th St., New York City.

Shakespeare's Works

"First Folio Edition"

Edited, with Notes, Introductions, Glossaries, Lists of Variorum Readings and Selected Criticisms, by CHARLOTTE PORTER and HELEN A. CLARKE, Editors of the "Camberwell" Edition of Robert Browning.

To be completed in 40 handy volumes, size 4¼x6¼. Sold separately. Cloth, net, 50 cents; limp leather, net, 75 cents. (Postage 5 cents.)

The following volumes are ready:

A MIDSOMMER NIGHTS DREAME
LOVE'S LABOUR'S LOST
***The* COMEDIE OF ERRORS**
***The* MERCHANT OF VENICE**

". . . I am convinced that these editors are the best equipped among us all for the beautiful yet arduous labor which they have taken in hand. The plan is mature and satisfying; it is what editing should be, or what, more's the pity, it so often is not.'

PUTNAM'S NEW BOOKS.

Field Book of American Wild Birds and Their Music

By F. Schuyler Mathews, Author of "Field Book of American Wild Flowers," etc.

16mo, with 38 colored and 15 other full-page illustrations, and numerous musical diagrams. *Net*, **$2.00. Full limp leather,** *net*, **$2.50.** (*Postage. 15 cents.*)

(*Ready next week.*)

A description of the songs and coloring of wild birds which will enable any one, even without a musical training, to easily identify them. The book fills a place never before occupied by any volume devoted to bird study.

Clarence King—Memoirs,

together with **The Helmet of Mambrino**

Published for the King Memorial Committee of The Century Association. (James D. Hague, Chairman.) *Ready next week.*

8vo, illustrated, net, $2.50.

As a Memorial of the late Clarence King, geologist, savant, connoisseur in arts, sciences. and letters, and widely known as a genial man of the world, his intimate friends and associates of The Century Club have composed this volume of memoirs under the direction of a committee appointed by the Board of Management of The Century Association.

The Jessica Letters

An Editor's Romance. 12mo. *Net*, $1.10. (By mail, $1.20)

The correspondence between a young New York Editor and a young Southern woman. The book is above all a love story. The letters are full of wit and refreshing frankness. The situations are delightfully romantic, and the work contains some of the prettiest love-making that has appeared for years.

The Veil of the Temple

By W. H. Mallock, author of 'The New Republic," etc.

12mo, net, $1.20.

(*Ready May Second.*)

A romance of society which recalls in its manner and characterizations the "New Republic." The book is enlivened by discussions of matters of belief and questions of the day, and as was the case with the "New Republic," some of the speakers can easily be identified with leaders of thought and of action in English society.

The Society of To-morrow

A Forecast of its Political and Economic Organization. By G. de Molinari, Correspondant de l'Institut, and Editor-in-Chief of "Le Journal des Economistes." Translated from the French. With an Appendix containing Tables on the Cost of War and of Preparation for War, from 1898 to 1904, Compiled by Edward Atkinson.

8vo, net, $1.50.

A valuable work, treating of the moral, political and social dangers which menace human society and of the best way of dealing with them.

The Mystic Mid-Region

THE DESERTS OF THE SOUTHWEST

By Arthur J. Burdick. 8vo, with 54 Illustrations. *Net*, $2.00 (By mail $2.15.)

Mr. Burdick brings to the public both a general knowledge of the deserts of the Southwest and a particular acquaintance by means of pen and camera with many of the most unique features and interesting localities in California and adjacent desert regions. "The Mystic Mid-Region" is a faithful chronicle of both the desert's pleasures and its terrors, its dangers and its delights, its mysteries and its revelations.

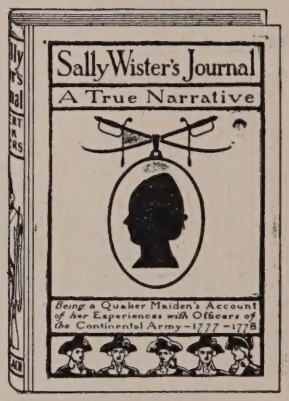
"Sally Wister is one of those charming maidens whose memory has been preserved,—like that of Dorothy Osborne or the Jessamy Bride,—by a fortunate accident. . . . We profess ourselves her devoted servants." THE ATHENÆUM (London).



Sally Wister's Journal
A True Narrative
Being a Quaker Maiden's Account of her Experiences with Officers of the Continental Army—1777-1778

Sally Wister's Journal

although a strictly historical document, is also a romance of unequaled charm. "The Journal has in many respects the attractions of a work of fiction. In fact, we have had considerable difficulty in persuading ourselves that we are not dealing with a wholly imaginative work. It throws many side lights upon the history of the times, giving interesting pictures of the society of the Revolution. . . . It is one of those books that one needs to read in order to get rid of the unreality that is apt to hang about the pages of history," says the Baltimore *Sun*. "A most delicious piece of literature," says the Philadelphia *Inquirer*. "The love-story is very pretty. This little scene has the color of an artist's interior,"—says the Hartford *Courant*.

SALLY WISTER, 16 years old, daughter of Daniel Wister, merchant, of Philadelphia, kept a journal of her experiences during the winter of 1777-1778, while exiled from Philadelphia during its occupation by the British. The family lived with relatives in an old farm house on the Wissahickon, which was occupied at times by various prominent officers of the Continental army. Sally saw much of the officers and heard much of the fighting, and comments on both freely and quaintly. Gen. Smallwood is "tall, portly, well-made: a truly martial air, the behaviour and manners of a gentleman"; Capt. Furnival, "the handsomest face I ever saw, a very fine person"; Captain Finley is "wretched ugly"; Maj. Stoddert, "very reserved" but has "an engaging countenance and address," etc. Later the Major grows much less reserved. Another officer who throws off his reserve is Capt. Alexander Spotswood Dandridge, of Virginia, a relative of Martha Washington. Sally calls him in the Journal "the handsomest man I ever beheld."

For a picture of this period from another standpoint read

"The Quakers in the Revolution"
By Isaac Sharpless, LL. D.

The second part of "A Quaker Experiment in Government."
12mo, cloth, $1.50.

Carefully edited from the original manuscript by Albert Cook Myers, M.L., who has collected a great mass of material elucidating the text, and also many portraits, relics, documents, signatures and pictures relating to characters appearing in the Journal. Beautifully printed on deckel-edge paper, profusely illustrated, and bound in antique style with a cover design by Walter Whitehead. **$2.00 postpaid.**

FERRIS & LEACH, Publishers, Phila.

The Nation.

NEW YORK, THURSDAY, APRIL 28, 1904.

The Week.

It is one thing to extend the iniquitous Chinese Exclusion act; it is quite another matter to square that policy with the probable needs of what is to be virtually the Crown colony of Panama. We may turn back Chinese subjects on the mere suspicion of "a duly appointed immigration officer," but in Panama they will very probably need coolies to haul and dig. Yet if the President is to receive in the Isthmus the powers that Jefferson exercised over the Territory of Louisiana, a little matter like law will hardly be allowed to delay the cutting of that ditch. It will always be competent for Mr. Roosevelt to appoint no inspectors at all, or to choose such as are not suspicious enough to take a coolie for a Mongol. We think the Senate need not let the point of law and consistency delay the extension of the Chinese Exclusion act. To a Crown colony government all things are lawful. Of course, the disinterment of Jefferson's act for the government of the Louisiana purchase will deceive nobody. No Congress could have framed a government offhand for that unexplored wilderness.

Both on party and on public grounds the Democratic Senators are justified in opposing the Philippine railroad guaranty. That clause of the general act gives the Philippine Commission full power to pledge the insular credit for thirty years. Such an action would mean that, whenever an autonomous government was set up, it would have to assume a great burden of obligations which were not of its incurring. To vote away Philippine money at Washington for a term of years would be an indication that we intend to treat the Islands as England treats India, holding them in indefinite tutelage. So the Democrats are absolutely right in demanding that no such discretion be given to the Philippine Commission until a policy shall have been fixed and proclaimed. Once assurances of independence were given to the Filipinos, it would be clearly inadvisable to saddle them with a load of debt for public improvements. If, on the other hand, independence must be put off, as Secretary Taft has hinted, for a century or so—why, then the Commission may fairly ask for a larger charter. On this point Secretary Taft owes an explanation to the capitalists upon whom he is urging Philippine investments to-day. They should be told under what form of government they are asked to invest.

Others may indulge in metaphysical discussions of the tariff, but Senator Gallinger of New Hampshire prefers to judge it by its fruits. He avers that our continued prosperity as a nation is the best possible assurance that our fiscal policy is sound and stable. This "continued prosperity" is witnessed in the shutting up of silk and cotton mills, the slow business in wool and woollens, the lessened profits in the iron and steel industries, the falling off in exports, and the reduction of wages and salaries throughout the country. The Senator placed the cost of strikes in 1903 at $1,000,000,000, but, of course, this does not trouble him. The idleness "was not due to lack of opportunity for employment"; there was work enough for everybody—at a price. Let us keep the tariff problem as simple as possible. We have all heard of the Iowa idea, the Minnesota idea, and the Massachusetts idea. But such ideas, says Senator Gallinger, cannot live long. "The only idea that should be cultivated is the American idea—the fiscal policy that protects all alike." This is sound doctrine. The foolishness of trying to keep an eye on the particular needs of Iowa or Massachusetts is apparent at a glance. There is only one really effective way of distributing prosperity by tariff. Put it up for sale and let the highest bidder have it. That allows an equal chance to everybody and every section, and is the true "American idea."

Representative Grosvenor's opinions of President Roosevelt are not less interesting than President Roosevelt's opinion of Representative Grosvenor. Each, as Congressman Kitchin showed on Friday, is eminent both as an author and an authority. When Mr. Roosevelt was Civil Service Commissioner he frankly described Grosvenor and others as "champions of foul government and dishonest politicians," and he added, "These men have a knack for office-mongering, just as some other men have a knack for picking people's pockets." This characterization of Grosvenor is exquisitely apt, a proof of Mr. Roosevelt's skill as a writer. Grosvenor frankly admits that his ambition is to lay hands on everything he can seize for his constituents; and he does not need to confess that he is equally ready to get what he can for himself. As a promoter of literary get-rich-quick schemes he has no equal in or out of Congress. It was not, however, in his famous 'Book of the Presidents' that he spoke his mind about Roosevelt, but in one of his by-products, correspondence for a newspaper. Writing from the Philadelphia convention of 1900 to the New York *Journal*, Representative Grosvenor had charged Quay and Platt with endeavoring to "dump" Roosevelt "upon the Presidential ticket for their own sordid purposes." As one who was near the throne, Grosvenor averred that this was an effort to "force McKinley to accept as a running mate one who was distasteful to him." When confronted with his own words, Grosvenor offered the weak excuse that "times and conditions have changed," and that Roosevelt's character has "developed." As yet we do not hear from Roosevelt why a champion of foul government and a dishonest politician was put forward as the public defender of the President's labor record. Have times and conditions changed, and has Grosvenor's character also developed?

The latest debate on the Capitol extension was notable because no Senator condemned the architectural profession out of hand, and because several of those who had been most vigorous in repudiation of that craft gave evidence of a complete change of mind. Senator Gallinger, for example, who a month ago had protested against the defiling touch of architectural sophistication in public building, voted cheerfully to submit the project to a commission including three architects of repute. Mr. Lodge, who had questioned the professional fee as excessive, transferred his pair with Mr. Clay in order to vote yea. In general, the history of the Capitol was reviewed, the solicitude of previous Congresses for "the noble structure our fathers erected" recalled with commendation, and the plans of the late Thomas U. Walter discussed with an intelligence meet for a seminary of fine arts. Evidently, a great work of education has quietly been going on, and the mollifying influences of art are permeating the most savage Senatorial breasts. All this is well, for it means that Congress is beginning to realize that it is the custodian of no mean monument. We shall probably not again see the Capitol turned over for demolition to a clerk who happens to have Congressional friends in high place.

The Republican national chairmanship is getting to have the air of being hawked about. Mr. Root would not have it. Gov. Crane of Massachusetts said, "I pray thee have me excused," and now it is reported that the position is to be offered to Gov. Murphy of New Jersey. His main qualification is openly admitted to be that of a good collector of funds. No one stands patter than he does; hence, no one could, in the historic phrase, fry out more fat. But it will be found, we believe, that there is one insurmountable objection to Gov. Murphy. His last annual message was filled with

glorification of the Trusts. Indeed, it went so far in that direction as to be taken as a direct attack upon President Roosevelt's Trust policy. It would be a trifle awkward, therefore, to have a Trust-"busting" campaign managed by a Trust-coddling chairman. Accordingly, we presume that Gov. Murphy will find his engagements such that he cannot accept the position.

It was fitting that Senator Foraker should "fire the opening gun of the Roosevelt campaign," as he is said to have done at the Vermont Republican Convention. He is not the Foraker that he was only a short time ago. If fate deprives us of a Hanna, it restores us a Foraker. New times demand new men, and Foraker is the man for the present. The President requires a mouthpiece. Lodge does not quite fill the bill, in spite of the fact that no departure of the President is so radical that historical justification cannot be found for it in the wide learning of the junior Senator from Massachusetts. There, too, is Senator Spooner, with his mind full of legal subtleties—the President cannot act quicker than this apologist can think. But his explanations involve too much reflection. The President is a plain, blunt man. His business is "to get there." What is needed is one who shall interpret such a President to a busy, care-vexed people, not by historical allusions, nor legal subtleties, but by heart-to-heart talks. That is where Foraker is preëminent. He himself knows what it is "to get there." The rarefied atmosphere of high political thinking has no attraction for him. He loves to get right down among the people who control the votes and deal out post-offices and collectorships to them. It was from such high tasks that he was called to sound the "keynote" of the Republican campaign. "We are standing pat." Standing pat on what? On as much protection "now as ever heretofore"; on a meaningless reciprocity; on unlimited expenditures; on unlawful interference in the affairs of neighboring countries; on a belligerent attitude towards the other hemisphere; on the usurpation of legislative functions by the President. The Republican party is the party that "does things," says Senator Foraker. No one would dream from his speech that there is a possibility of doing things badly.

The former postmaster at Dunkirk, Frederick C. Nagle, and his bondsmen are being sued by the Government for the recovery of money illegally paid out through his office. This is one of the star cases printed in the Bristow report as an illustration of the "reckless and criminal waste" of George W. Beavers. John A. Link was appointed a laborer in the Dunkirk office on May 1, 1898, at $600 yearly; and he drew pay until June 30, 1903, a period of more than five years. He received in all $3,100.55. And yet, throughout, he worked at his trade of barber; he rendered no service to the Government, though he had the grace to pay $171 for a temporary substitute. The postmaster who permitted such a fraud is very properly liable for the loss. But what shall be said of former Representative, now Judge, Warren B. Hooker? He is the man who is charged with instigating the plan; he was unusually successful in procuring such favors from the obliging Beavers. Nagle seems merely to have been a wheel in Hooker's political machine; but Nagle suffers the legal penalty, while Hooker is promoted to the bench.

Our State Department is of the opinion that a sin confessed is half forgiven. Early this year an order was sent to our consuls abroad to require original bills in the case of all goods shipped to the United States. The hardship of this was so great that the American Chamber of Commerce at Paris, on March 4, sent a protest to Washington, asking for a suspension of the order and declaring it impossible to enforce it. This has just resulted in cable instructions to the Consul-General at Paris to comply, and the news has been telegraphed to the other consulates in Europe. But is not this a dangerous precedent? Suppose the original order did work hardship to exporters to this country. Is not the whole object of this Government to discourage imports? Our aim should be to keep out everything. As Senator Dolliver said last week, we shall not consent to any change which surrenders the rights of American labor or the advantage which every man who makes a bona-fide investment of his money in the United States "ought to have over his competitors in other lands." Let us be just to ourselves before we are generous to our competitors. To construe the Constitution loosely may be a venial offence; but certainly anything but the strictest interpretation of the protective tariff is most tolerable and not to be endured.

A close study of the trade report of the United States for March reveals certain interesting facts. The exports last month were the smallest for any March since the close of 1899, with the exception of 1902. Imports, however, with the exception of 1903, were the largest on record. To put it another way, in March, 1898, we showed an excess of exports amounting to $51,058,313, against $28,511,235 in 1904. The excess of exports for the nine months since July 1, 1903, is greatly above that of a year ago; but it was then unusually small. But the important fact is, if exports continue to shrink at the rate indicated in March, some awkward explanations will be in order later on. A diminishing balance of trade is an embarrassing feature of a Presidential year. Last week Representative Hamilton of Michigan made a "red-hot" speech, stating that "there is something about the Republican party that sends things above par, and something about the opposition that sends things below par." Speaking generally, industrial conditions do not seem exactly above par at present. If, on top of these, exports continue to fall off about $12,000,000 a month, while imports decline not more than $5,000,000, will not the balance-of-trade theory have to be retired for repairs?

The dismissal, Monday, of the Virginia suffrage cases marks the latest failure to get the constitutionality of the various Southern disfranchising measures fairly before the United States Supreme Court. The cases in question were based on prayers to restrain the canvass of the returns of the Congressional election of November 4, 1902. The Court has found no difficulty in avoiding jurisdiction. It simply declares, in the opinion by Justice Brewer, that the thing sought to be prohibited has been done, and cannot be undone by any order of the Court. The canvass has been made, certificates of election have been issued, the House of Representatives, which is the sole judge of the qualifications of its members, has admitted the parties holding the certificates. Therefore, any adjudication which the court might make would be only "an ineffectual decision" of the question whether the petitioners had been wronged "by what had been fully accomplished." Thus far, those who have attempted to test the constitutionality of the disfranchising laws have been defeated on technicalities. The particular law in question may or may not conform to the Constitution of the United States, but the Supreme Court points out that the House of Representatives is endowed with full power to pass upon the credentials of its members. As in the Alabama cases, therefore, the Court intimates that the remedy must be political rather than judicial.

The rejection by the Circuit Court of the so-called Harriman petition against the official plan to liquidate Northern Securities brings considerably nearer the conclusion of the whole affair, and for that reason is likely to be welcomed by the community at large. Whatever controversy remains is shifted now from a struggle to reopen the whole case, to a suit in equity whereby the injury done to the Union Pacific interest, if any, may be determined. If it is decided that no injury has been done—that the Harriman interest, when

depositing in a merger one class of property, took the risk of not getting back, on a compulsory liquidation, exactly what it had deposited—then it would seem that the legal dispute can go no further. A good deal has been made, on the Stock Exchange particularly, of the imminent danger that the "Northern Pacific fight" of 1901 between rival banking interests may promptly be renewed. No one need claim the gift of prophecy, however, who points out that these are not "fighting times" in Wall Street. Financial events since May, 1901, have shown the reckless bidding, first for Burlington and Quincy and then for Northern Pacific stock, to have been based on confident expectation that the credit of some other corporation could be pledged to foot the bill, and that the "outside public" would cheerfully purchase the new securities issued for such purpose. This recourse served passably in 1901; but every ambitious railway manager has been taught, by bitter experience in the past year's money market, that to lean upon it to-day would be to lean upon a broken staff.

The new British budget is distinctly in the nature of a makeshift. There is no mistaking one fact—the normal level of Government expenditure has been raised enormously in the last few years. But so far no systematic effort has been made to meet the new conditions, the measures adopted being admittedly of a temporary nature. For 1895 the budget estimates of the revenue were £94,175,000 and the actual receipts were £94,683,762. The estimates for the year just closed were £144,186,000 and the actual receipts £141,546,000. In 1895 the actual expenditures were £93,918,421, against £146,895,500 last year. Stated otherwise, the expenditures in 1895 were about 15 per cent. larger than in 1880, whereas those for 1904 were about 55 per cent. in excess of 1895. The real significance of the new budget is that it emphasizes a fact previously suspected, namely, that the present expense-rate of the Government has come to stay. Sir Michael Hicks-Beach had no doubt of this as far back as 1901. In his budget speech of that year he said that the real difficulty was not the war expenditure, but the ordinary expenses of the nation. He was convinced that, in imposing such additional taxation as was needed to meet the additional outgo of the year confronting him, the Government should make some endeavor "to put our financial situation on a broader basis." No such endeavor, however, has been made. The protests with which the increase in the income tax and the tea duty have been received indicate clearly that Mr. Austen Chamberlain's method of meeting the situation has nothing permanent about it.

Highly significant facts regarding the Transvaal gold production were made public at a recent meeting in London of the Standard Bank of South Africa. In his survey of 1903 Sir Spencer Walpole, the chairman, reported the output of the mines at £12,500,000. This compares with £7,179,074 for 1902. The best year in the history of Transvaal mining was 1898, the yield being £15,141,376. In short, despite all accounts of business depression and scarcity of labor in South Africa, the production of the mines last year was five-sixths of that of 1898. During the last half of 1903 the output was over £7,000,000, so that it is likely that, inside of twelve months, the record figures will be surpassed. Such a rapid gain casts discredit on much that has been said concerning the labor situation of the Transvaal. To be sure, there were only 68,000 natives employed in December, 1903, against 100,000 in 1898, but this was 4,000 more than were at work in June last year. On its face, the efficiency of the 68,000 appears to have been relatively higher than that of the 100,000. Speaking broadly, this rapid increase in the Transvaal gold output could not come more opportunely. The borrowing needs of the world are certain to be unusually heavy in the next few years. In order that they may be satisfied, gold must flow into the banks in unprecedented amounts.

While the labor leaders of this country have been trying to get Congress to pass an anti-injunction law, those of Great Britain have aimed to secure the adoption by Parliament of a measure which shall prevent a repetition of the Taff Vale decision. These bills approach the situation from exactly opposite points. It is rapidly becoming our practice to proceed against picketing, boycotting, and other unlawful measures by injunction. The English policy is to wait for the overt act and inflict punishment for that. The Taff Vale decision, which resulted in heavy damages against the Railwaymen's Union for picketing and interfering with non-unionists, was a heavy blow to the British labor unions. They are now trying to get Parliament to legalize picketing, to amend the law of conspiracy, and to protect their funds against legal process. Their bill passed the second reading in the House of Commons on Friday by 39 majority. The Premier, Mr. Balfour, opposed it on the ground that it conferred special privileges. That the measure will actually become a law we doubt; but there is to be a general election soon, and the labor unions have to be treated with great consideration meanwhile. There is to be an election in this country, also, but Congress pursues a different method. It lets the anti-injunction measure go over until next December. This is a more courageous policy than the British. Indeed, the anti-injunction bill has found fewer supporters this year than last.

Rio de Janeiro has abolished its old-fashioned quarantine regulations, and vessels with cases of yellow fever on board will hereafter be simply disinfected and supervised. The change means a victory for that city's new health board, the head of which is Dr. Oswaldo Cruz, who, after a great deal of hard work, succeeded in convincing the Brazilian Congress of the correctness of the "Cuban" theory regarding the propagation of yellow fever by mosquitoes. Notwithstanding the success of the United States officials in completely ousting that disease from Havana, there was much opposition to Dr. Cruz, but at last Congress voted the sum of $1,250,000 for a war on mosquitoes. Last October 1,200 men were engaged in destroying the larvæ of those insects. The natives were at first inclined to laugh at this brigade, with its brooms, ladders, kettles, and cans of coal oil; but they became serious when they learned the result—only 9 cases of yellow fever in the midsummer months of January and February, as against 275 cases in the same months last year. In the period from 1850 to 1896 the number of deaths from this disease in Rio was 51,600. There have been times when as many as 2,000 patients were cared for in the isolation hospital, situate near the cemetery, and known as the ante-chamber of death. This hospital, which was an ideal focus for the propagation of the disease by infected mosquitoes, and from which few patients used to emerge alive, is now closed.

Ex-Premier Okuma's warning that war taxes will undoubtedly continue long after the war is over, has the merit of frankness. The Japanese have only to turn to England to see that war always leaves a trail of increasing expenditures, and, if that does not suffice for demonstration, let them recall that the United States is still paying war tariffs and war expenses to the tune of hundreds of millions a year. It is the part of prudence, then, for the Japanese to plan for permanent increase of revenue. Intervention was freely discussed in the Diet on Friday, and it was more than hinted that Germany's attitude is ominous. This seems to us comparatively an idle fear. It must be understood in all the chancelleries that Japan will not hear of intervention until she holds the Mantchurian shore of the Gulf of China, or is defeated. Rumors to the contrary notwithstanding, no intervention of a serious sort is likely to be undertaken until the issue is settled between the two armies facing each other on the Yalu.

IDEALS TO BE CHERISHED BUT NOT DISCUSSED.

Secretary Taft's speech on the Philippines before the Chamber of Commerce on Thursday confirms the impression which everybody has had of his candor. What others have slurred over or denied, he frankly admits. He acknowledges that Aguinaldo and his forces were our "allies" in the war with Spain; he concedes that the Philippine venture which was to make us all rich has, in fact, cost us at least $300,000,000, on which we shall never get a return—"that is spent," the Secretary says; he tells us squarely that "the American community in the Philippines to-day is largely an anti-Filipino community," treating the natives with contempt and harshness, and that undisguised greed has been the motive of almost all the American "civilizers" who have gone to the Islands. Mr. Taft also characterizes as grasping and oppressive the act of Congress in applying our coastwise shipping laws to the Philippines—this only a couple of days after Senator Foraker had enumerated the same measure as among the "blessings" we had conferred upon the Filipinos. Moreover, Mr. Taft stands unflinchingly by his old contention that, in spite of all the grumblers and traders and exploiters and exterminators, this country must still cling to the motto: "The Philippines for the Filipinos."

Such manly courage and consistency in humane policies must excite general admiration. Secretary Taft's personality appears in a most engaging light. His good intentions are as clear as his frankness. But all this only makes it the more mysterious to us why he should have so nervous a dread of discussing our ultimate goal in the Philippines. He addresses himself specifically to the work just now undertaken by the Philippine Independence Committee. Its present effort is to induce both political parties to promise, in their national platforms, full self-government and independence to the Filipinos. But this is deprecated by Secretary Taft. Even if we intend independence, he affirms, we must not say so. There is something deadly about the very word. It must not be spoken aloud.

Mr. Taft is aware that many "good people" are signing the petition for Philippine independence. He has done all he could, both publicly and privately, to head off the movement, but it goes steadily on. The Independence Committee itself contains the names of some of our most eminent citizens. Cardinal Gibbons is the latest addition. Bishops and college presidents by the score have signed the petition, and already more than 400 college professors have given in their adhesion. The cause is thus rapidly assuming an expression of American intelligence. Yet why, asks Mr. Taft plaintively, should all these "good people intermeddle with something the effect of which they are very little able to understand"?

That position is, to say the least, tactless. It is not quite shrewd for a college man to tell the leaders of college men that they do not know what they are talking about. These gentlemen are not in the habit of acting without due deliberation. They have their American ideals, and are accustomed to assert them. Certainly, they will not be deterred by being warned that they are meddling in a work which should be left to a higher order of intellect. Some of them, moreover, are able as well as Secretary Taft to speak with the authority of a man who has "been there." President Schurman cannot have ceased to have weight simply because experience and study led him to change his mind, and he now believes in pledging the Filipinos their independence. In any case, it comes with ill grace from the spokesman of the party of intelligence to rebuke intelligence. You have got to take it as it comes. When it is for you, pat yourself on the back if you wish; but when it is against you, do not slap its face.

And how impossible of realization, even if it were wise, is Mr. Taft's plan of our all keeping still, lest, if we utter the horrible word independence, we "frighten" somebody! When did he come to believe that the most voluble and irrepressible democracy on earth could be got to surrender the right freely to discuss? Why, his very attempt to burke discussion is discussion. He himself utters the fearsome word which he says no good patriot should breathe. Will they not read in Manila what he says in New York? On his own showing, the mischief is done. The Filipinos will find out that there are thinking Americans who believe them fit for independence. They have learned it from Secretary Taft's own speech. He could not himself take his own prescription of silence. Deprecating discussion, he discusses. How can he cure others of this awful disease of speaking the thing they will, if he is not able to physician even himself?

All we can say is that if successful rule in the Philippines is conditioned upon muzzling debate in the United States, it will never be successful. That ought to have been thought of first. Americans may be conceived of as conquerors and colonizers, but never as tongue-tied ones. Whatever government we set up at home or abroad has got to make up its mind to be talked about with the utmost freedom. We may suppress free institutions across the seas, but we will see to it that speech remains free at home. You will have to try again, Messieurs Imperialists! If you can't make your schemes work without inducing Americans to refrain from speaking their minds about them, you can't make them work at all. We have not so completely forgotten Milton's definition of the birthright of a freeman.

BRYAN AND THE PLATFORM.

A great discovery has been made: party platforms are meant to be read. That this idea was entirely novel to politicians is implied in the extraordinary amount of comment upon the New York Democratic platform, adopted on Monday week. Nobody paid any attention to the Republican platform of the week before. Beyond searching its wastes for an occasional curious infelicity of language, no one seems to have noted or cared what was in it. Even good Republicans were content to adopt Dr. Johnson's attitude towards a dull book, and say that they would rather praise the platform than read it. But the Democratic platform not only could be read, but evidently was read. From one end of the land to the other its few and terse sentences have gone echoing. Mr. Bryan has been so moved by it that he has had to hire a hall in Chicago to unbosom himself. Of course, Mr. Bryan, as Herbert Spencer said of Carlyle, secretes a certain number of curses every day which have to be vented upon somebody or something, and why should the New York platform escape? But at least it has been read.

We already have, therefore, proof of Mr. Cleveland's wisdom in advising a short platform. No other kind is really worth writing—that is, if the object is to get people to read it. If the chief end of platforms is to conceal not only thought but convictions, a flood of words is just the thing. Apparently, the Democrats decided to take their State platform of 1874 as a model. That was one of the most effective political documents ever printed. Made up of thirteen propositions in exactly thirteen sentences, its pungency of diction and explicitness of phrase rendered it easily understanded of the people, and undoubtedly contributed much to the election of Gov. Tilden in that year. Since then, platform-writing seems almost to have become a lost art. Party deliverances drag their meaningless length along portentously. They have come to be regarded as a mere tedious formality, one of the things which every party convention must have, but which no one expects will be widely read or long remembered; while to demand that the party live up to its platform is thought to be the richest of jokes.

This is not at all to say that we think the New York Democratic platform was let down bodily out of heaven. It makes no claim to divine inspiration; but it is of the right human sort, being straightforward and clear-cut. It not only revives the approved party doctrines, but embodies a sounder tradition of political discussion. We hope, therefore, to see its

example followed at St. Louis. The national platform will have to be somewhat longer; it will have to commit the party squarely to no meddling with the gold standard; it will need to make a stand against all the vices and perils of Imperialism; but it can and should do so in compendious and readable form, and by the method of asserting great political principles to be applied as conditions demand.

Mr. Bryan protests that it is not complete; but we know of no man who ever asserted that it was. The national platform is to be written at the national convention. State platforms are usually, and properly, condensed and general. Indeed, the New York Democratic platform of 1900 was filled with the phrases which Bryan now denounces as meaningless platitudes. He sneers at the expression in this year's platform, "No Government partnership with protected monopolies." Infinitely absurd, he cries. But in June of 1900 the platform which pronounced for Bryan, and which elicited not one protest from him, declared: "We are opposed to Governmental partnership with protected monopolies." Why should what was courage and explicitness in 1900 have become only timid ambiguity in 1904? Why, except that then the State Convention was for Bryan, but now for Parker?

There is, indeed, something not a little comic in Mr. Bryan's sudden discovery that platitudes should never be indulged in by politicians. The man who filled the land with the gigantically obvious, and glitteringly general, the emptiest of mouthed nothings, shouted from a thousand stumps, now converted in a day into a severe logician, the most precise of public men, who would never make a promise without writing in every detail, nor lay down a principle without stating its every conceivable application! Platitude for platitude, his own Chicago and Kansas City platforms would yield as goodly a crop as those which he now would wither by his scorn. What say you to tariff duties "so adjusted as to operate equally throughout the country"? That gem of paltering is from the Chicago platform of 1896, upon which stood the hero whose soul abhors a platitude—in another. Four years later he was happy with such an egg-dancing deliverance as this: "We favor such an enlargement of the scope of the Interstate Commerce law as will enable the commission to protect individuals and communities from discrimination." According to the Bryan of to-day, hungry for particulars, that plank should have read: "We demand that Congress compel the Burlington Railroad to carry W. J. Bryan's hogs from Lincoln to Kansas City for 1⅝ cents a hundred." That is the only way wholly to escape platitudes.

Behind all this hypercritical and alarmed attack by Mr. Bryan upon a platform not yet framed, lies the question what he is going to do when a large majority of his party adopts at St. Louis a platform which he disapproves. Will he submit or bolt? Mr. Bryan's political instinct is sound when it prompts him to make the fight more upon the platform than upon candidates. All will centre this year in the party doctrines that the Democracy puts forth. The strongest personality in the candidate would be pulled down by a repetition of the platforms of 1896 and 1900; the weakest might conceivably succeed upon a vigorous assertion of the political principles which the occasion demands. But what the party is beginning to ask is what Mr. Bryan intends after he is beaten in the drafting of the platform. Going into a convention fairly chosen and where he is given a full hearing, will he, if he cannot have his way, go out and set up the standard of revolt? At present, he refuses to answer that question. He puts it aside on the pretence that it is impossible for his opponents to obtain a majority. But even he must really see that such a majority is already assured, and we have no doubt that he and his Hearst allies are debating in their own minds what will be their wisest course when the blow falls.

Now the divine right of bolting is something we have always maintained. To walk out of a convention on a question of principle may be the highest form of political duty and of political achievement. But Mr. Bryan has preached the opposite doctrine too vehemently to turn about now, save with the most ill grace imaginable. For years he has poured out the vials of his vituperation upon the Democrats who bolted him in 1896. For them there could be no forgiveness. They had refused to acquiesce in the will of the majority, and had thereby made themselves the chief of political sinners. Can it be supposed, then, that he will now call his own condemnations crashing down upon his own head? If the Palmer and Buckner movement of 1896 was treason, what would a Bryan and Hearst defection of 1904 be? Treason with infamy added.

OUR JEWISH IMMIGRATION.

There is an obvious connection between the arrival of 10,000 Italians and Russian Jews at Ellis Island on one day, last week, and the present rent disturbances on the East Side. With such additions constantly made to our tenement population, the increased cost of living quarters is explained, at least in part. But does the apparent distress in the Ghetto signify that Jewish immigration has gone too far? Has the city of New York misjudged its ability to assimilate material of this kind?

The majority of Jewish immigrants get no further than Manhattan Island. Of those specifically enumerated by the Immigration Bureau as Hebrews, about 68 per cent. give New York State as their destination. In the main, this means New York city. The Federation of Churches estimates our Jewish population at about 600,000. If this be accurate, the Jews are second only to the Irish, who number 725,000. Strictly, natives of the German Empire head the list with 786,000, but of these a good proportion is really Jewish, and is included in the Federation's estimate.

As nearly as can be determined, this population increases at the rate of 50,000 or 60,000 a year. It comes chiefly from the Russian and Austro-Hungarian Empires. Its educational and economic condition is very low. Twenty-six per cent. of the Russian Jews are totally illiterate, thus comparing unfavorably with the one per cent. attributed to the Scandinavian peoples and the 4 per cent. to the German and Irish. Industrially, the immigrant Jews are equally handicapped. More than 40 per cent. are without any occupation, while of Jewish workmen 65 per cent. belong to the unskilled trades. Tailors and seamstresses are their main contributions to the economic life of the East Side. Of the 76,000 Hebrews enumerated last year, only 46 were farmers and 334 farm laborers. Naturally, then, the Jews herd in the cities, and especially in New York, for here are unusual opportunities for the exercise of their commercial talents.

It is thus not difficult to make out a prima-facie case against the Jewish immigrant. His "statistical position," as tabulated at Ellis Island, is decidedly unfavorable. The proper test of an immigrating people, however, is not its status in its own country, but in this. Especially is this true of the Russian and Polish Jew, who notoriously does not have a fair chance in his native land. Probably never has he had so good an opportunity as in this city to-day; and that he is quick to take advantage of it is plain. On the economic side, at least, no one would deny him a high measure of success. Poor as the Jew is on his arrival—his average worldly estate is $10—he is remarkably quick in acquiring an independence. The present difficulties over increased rents, far from indicating any great prevalence of poverty, suggest quite the reverse. The landlords would not dispossess their tenants were there not plenty of others ready to step in at the higher rates.

Another fact emphasized by the present agitation is that many landlords themselves are Jews. The public has little appreciation of the extent to which the soil of Manhattan is passing into Jewish ownership. In 90 per cent. of current real-estate sales the purchasers are Hebrews. In the main, too, they are immigrants of only a few

years' standing, who, when they landed, were little removed from want, and whose tenement-house investment represents the hardest kind of labor and constant self-sacrifice. They are peddlers, small shopkeepers, and workingmen, whose highest ambition in life is the fee ownership of land. There is probably little property south of Houston Street and east of the Bowery which they do not now possess. The old estates are rapidly withdrawing in their favor. Even such tenacious landholders as the Astors are selling their East Side holdings to Russian and Polish Jews.

Socially, also, these Jews are on the up grade. This is especially evident in the disintegration of the Ghetto. Five years ago the whole Russian and Polish population was collected in the lower East Side, but of late it has found its way into other sections, into Harlem, the Bronx, Brooklyn, and Queens. The better and more prosperous classes move, the impulse coming usually from the younger generation, which has grown up under American influences, attended the public schools, and learned to dislike the customs of the Ghetto. They have moved from the comfortless flat into the steam-heated apartment. The women have abandoned their shawls, wear hats, and scorn to chaffer at the pushcart. This breaking up of colonies is one of the surest tests of assimilation. Forty and fifty years ago the Irish and Germans huddled together on the East Side, but are now scattered all over town. The process in the Jewish quarter has only begun, but will be greatly stimulated by the subway, which opens up large areas of cheap land adaptable to tenement building. And with this economic and social uplift the Russian and Polish Jew will undoubtedly reach higher political standards. It appears, then, that, even in the case of these unpromising immigrants, this country is still doing its wonderful work of assimilation and civilization.

GERMAN AND OTHER PUBLIC MEN.

Perhaps the most interesting feature of the recent Government triumph in Hungary was the sudden rise into European prominence of a party leader hitherto unknown outside of the parliamentary circles of his own country. The complete collapse of the obstructionist campaign against the Government Army bill was due to the masterly tactics and the rhetorical power of Koloman von Thaly, the honorary president of the Hungarian party of Independents, and, as historian and former college professor, a mere "scholar in politics." Such a scene as was witnessed in the Hungarian Diet at the close of his speech showed that idealism in politics is still a power to be reckoned with. As Deputy Rakosi expressed it, "only a poet and historian could have brought about such a happy issue." Nowhere was Thaly's achievement more admired than in Vienna, where the absence of enlightened and practical leadership has long been a reproach to the Liberal cause, as in Germany the barren wrangling of modern party strife in the Reichstag is keenly felt.

Dr. Theodor Barth, himself one of the most notable survivors of a high idealism in German political life, has recently pointed the contrast between the present and the past in his sketches ('Politische Porträts') of that remarkable group of men who, in the era of Bismarck, and after, held fast to the Liberal faith. The greatest of those who honored the name of German Liberal, Theodor Mommsen, died but lately, and it is instructive to recall, in Dr. Barth's words, his services to a cause which knew no national boundaries:

> "Whenever freedom of art and science was endangered, Mommsen was one of the first to come to its rescue. And at all times it was his ardent wish that the relations of Germany to the other great civilized Powers might become more intimate. But he reserved the right of criticising the political shortcomings of other nations in their duty to humanity, just as he conceded the right to other nations in their relations to Germany. . . . Chauvinism and national boasting he abominated."

Mommsen was united by political affiliation and close personal ties to Ludwig Bamberger. No more incorrigible idealist ever participated in German political life, practical man of affairs as this Jewish economist was. The dreamer of 1848, the lifelong "literary epicure," became one of the highest authorities on financial questions before the Reichstag. To Bamberger more than to any one else was due the establishment of the gold standard. And yet this hard-headed, practical politician, this uncompromising champion of liberty of conscience, of speech, and of commerce, was a very poor party man—now a National Liberal, then a member of the Liberal Union, then a Progressist, and again a temporary member of other political organizations. He was at no time a politician in the American sense of the word. He was one of the most fascinating speakers that ever addressed the Reichstag, and, like Gladstone, could make the subject of cheese and herring interesting. As for his literary activity, Dr. Barth calls his writings on Bismarck "the best commentary on the life and the work of the great chancellor, both as to their bright and dark sides, which German literature has so far produced."

A sneaking fondness for literature is not so easily pardoned in the present political life of our country as it was in the days of Madison and John Quincy Adams; but in Germany the tradition has remained unbroken to this day. Even Bebel has several purely historical works to his credit. One of the most conspicuous members of the German Liberal party was the scholarly Franz von Stauffenberg. He was closely associated with Lasker, Forckenbeck, Bamberger, Friedrich Kapp, and other men of "talent, character, experience, and genuine culture," whom Bismarck "honored with his especial aversion," although they had in their day warmly supported his national policy. Even in such a circle, Stauffenberg shone by his intellectual versatility. But, for all his interest in literature and in spite of a feeble constitution, he was a conscientious parliamentary worker, especially in the Committee on Finance, where his knowledge was invaluable. Although a large landed proprietor, he was a foe to agrarianism and a consistent free-trader.

Heinrich Rickert, though intellectually not so flexible as some of his party associates, possessed the requisites of leadership to a greater degree than any of them. He had an instinctive knowledge of the under-currents of public opinion, a keen scent for coming events. Bamberger said of him, what was said, in different words, of McKinley: "Rickert has a fine nose for the smell of the soil." But no one was further removed than he from time-serving or selfishness. He was indefatigable in helping others.

> "No matter whether the fate of a sick letter-carrier was at stake or a teacher had been wronged, or an edict of expulsion against a Russian Jew was to be revoked, Rickert was always to be counted on. . . . The same warmth of sentiment which caused him to fight, with all the energy of his person, and in despite of sneers and obloquy, for the political equality of the Jews, made him the advocate of woman's rights."

Scarcely less attractive is the picture drawn by Dr. Barth of Georg von Siemens, for thirty years director of the Deutsche Bank, next to the Reichsbank the largest banking institution of Germany, to which he devoted his vast knowledge of finance and a "proud integrity which would have considered itself degraded had it conformed merely to petty, conventional standards." Siemens had long been designated by the press as the future Prussian Minister of Finance, but he declined to be used as a mere "show-piece at a bureaucratic-agrarian-protectionist banquet." To Georg von Bunsen, finally, who for many years most unselfishly and modestly labored, in the Prussian Lower House as well as in the Reichstag, in the promotion of every good cause, Dr. Barth applies the words of Lord Rosebery, when speaking, in his 'Life of Pitt,' of a politician who had done little that was "positive," was always in the Opposition, and yet had permanently influenced English political life: "He was the embodiment of every quality lovable in man."

Such are the traits of some leading German parliamentarians of a very recent epoch whom Dr. Barth justly holds up to public admiration. Perhaps some day he may add to the list men of no less

force and attractiveness, like Lasker, Forckenbeck, and Schulze-Delitzsch. They all represent types of the idealist in politics, in which Germany has been particularly rich, and of which no country can have too many. Is it idle to hope that ours may yet live down the reproach of Tocqueville—namely, that "the ablest men in the United States are rarely placed at the head of affairs"?

JAPAN: A PARADOX IN EDUCATION.

A certain condescension with which military critics have been congratulating Japan upon her successful application of our teachings, is changing to an uncomfortable sense that we Occidentals are every day learning hard lessons from Japan. The demonstration of the efficacy of unarmored vessels, the successful operation of contact mines as a means of offence, add new chapters to naval theory, and we may not lightly flatter ourselves that these formidable inventions are merely the obvious application of our teachings. No; this remarkable mastery of the machinery framed by the Western mind denotes not simply that the Japanese have caught up with us and surpassed us in a single generation of conscious imitation; it means rather that in feudal Japan there were qualities of mind stable enough to bear the impact of new facts and accurate enough to master them. The successes of Japan to-day in scientific warfare are due to that immemorial discipline of hand, heart, and head which has made the Japanese mind.

To those who cherish conventional ideals of education it may be instructive to ask what that education was. And immediately we meet the paradox that the training which is every day producing practical results of the most sensational kind was the most impractical that may be conceived. The heart was trained by rigorous subjection to the most exacting of social codes, the hand by devotion to minute and exquisite workmanship, the head by poetry, romance, and speculative philosophy. Were a British schoolmaster asked to construct a scheme which should totally unfit his students for practical affairs, it would not differ greatly from the Japanese plan. Among the upper classes the earliest training is in calligraphy, and the control of the ideographic script makes every educated Japanese an artist in the handling of the brush. The artisan class gets a similar schooling in trades which are all conducted with the patience of the ivory carver or the designer in lacquer. Against this perfectly trained hand the West sets a hand numbed and almost superseded, as an instrument of precision, by the machine. For that check upon lawless emotionalism which a fixed social etiquette provides, the West offers individualism—that is, the caprice of the unschooled man.

But the two disciplines of fine craftsmanship and fine manners are, after all, secondary, else a legion of watchmakers and dancing masters might conquer the world. What has really made the Japanese mind the superb instrument it is daily proving itself to be is the habit of abstract meditation—of separating the operations of the intellect from those of the emotions. For some two thousand years the best minds of Japan have had the habit of hard and consecutive thinking along metaphysical lines. The generalizations which fix the individual's relation to society have been no more carefully pondered than the relations which exist between the individual and the cosmic order. It is common to condemn this Stagyrite attitude. The West to-day lets the sleeping dogs of philosophy lie, and turns to science and engineering. From the China Seas comes the startling message that your best engineer comes from generations of mystics, that, by a strange perversion, the soul of Siddartha is controlling with a precision before unknown the weapons forged by Thornycroft and Krupp.

If there is anything to learn from this paradox, it is the value of mind stuff in all its phases, the folly of off-hand opinions on national superiority, the fallacy that infects the so-called practical education of to-day. It is wholesome and fortifying to recall that all hard-thinking is potentially practical. Larger tolerance comes from the thought that intellect is not necessarily wasted because it does not emerge through the conduits of our particular national or racial activities. Some of the best thinking of the world was done by the schoolmen. St. Thomas Aquinas, perhaps, might have marshalled armies with the precision displayed in the "Summa"; it would have been no more surprising than the patient planning and actual execution of the present naval campaign by the offspring of the Samurai, with their code of honor more tortuous than any theology. No hasty generalization as to the inferiority of yellow races can obscure the fact that, measured only by skill in handling the latest machinery of civilization, the Japanese appear as the superior, the Russians as the inferior, race.

Broadly considered, the significance of great tacticians bred on calligraphy and metaphysics seems to be that the intellect finds its account in a great variety of educations, and prevails even over the worst. And, more particularly, the ease with which scientists, engineers, naval and military experts have been produced in Japan proves that often the most abstract training is the best preparation for practical efficiency. The cherry-stone carvers have been preparing to hold the lever and the trigger; the pundits have found the plotting of a campaign upon Port Arthur already accomplished in their ancestors' charting of the cosmos and the soul of man. The Japanese have not been taught to despise anything as too small or too great. No illusion of racial superiority has fostered a faith that they can blunder luckily through all emergencies. No superstitious respect for machinery has betrayed them into scorning the finest of all instruments—the mind itself. Their success is a warning to them not too readily to give up the educational standard under which they are conquering, and a reminder to us not to substitute workshops and sham practicalities for the old liberal training that makes the mind hardy enough to answer all challenges, and steady enough to meet the most exigent practical demand.

A LEWIS AND CLARK ATLAS.

Lewis and Clark, on their expedition, were both legally captains, though Lewis was the senior. But while Lewis was the military head, Clark was the engineer. On land he was foremost in the van as pathfinder, and so trail-tracer and then mapmaker. The maps in all editions downward from the *editio princeps* of 1814 have merely copied his original, with some mathematical additions which he had welcomed from Hassler, professor in West Point. Tested in many ways for a century, Clark's map, one foot by two, has been proved surprisingly correct, both in grand features and even in details. How it was possible for him to avoid serious error is a natural question. The answer is, that such an achievement must have been beyond possibility but for his daily field-work kept on though (as he writes) "the ink was freezing in his pen." It was for him day by day to draw all forthrights and meanders, with courses, distances, sometimes latitudes, and always the face of the country, with corrections of first impressions.

These cartographics by the way—and where there was as yet no way—mysteriously vanished. It is not likely that they came into Hassler's hands or those of Biddle, the earliest of literary editors. They eluded the research of Coues as well as of others before and after him, and were set down as extant no longer; yet, held by their author with reason as the immediate jewel of his soul, they were treasured by him in his St. Louis home until his death, in 1838. Some years thereafter they were carried by some of his heirs to New York, and only last October came to the knowledge of any one who knew how to make the most of the line of light which Clark's topographics first made to shine from our great river to the Western continental verge. These drawings were detected and unearthed after a year-long hunt and baffled endeavors by Mr. R. G. Thwaites, who has already brought out more volumes concerning Western history than any other man, and who will include this unique windfall in an atlas to the Lewis and Clark which he is now doing his best to make his *opus magnum*.

The Bierstadt process will here have free course, and be glorified as never before. Its facsimiles are veritable doublets or replicas in shading as well as in form—not a *blot* erased, not a line obscured. In read-

ing an autograph letter we see, or unawares feel, a thrill and significance which we cannot get from any typewritten copy. The former has something of its own—something of its author himself—an aroma, or we know not what, which is lacking in the latter, and must be, so long as men retain individuality. Time and accident have dealt gently with Clark's drawings, yet their original limitations, peculiarities, and imperfections will still be on the head of his handiwork. But with all their faults—and thanks to their faults—the appreciative gazer on them will love them all the more. They are Clark's own.

Our idea will be clear from a glance at the subject-matter of any single map. There is one on the midway crucial portage from boat to boat. The order to go to the end of the Missouri had been obeyed; an oarsman in a cañon, with one foot on each of the rocks which hemmed in and crowded his canoe, had thanked God for living to bestride the continental river, and within a mile of the ultimate source a rivulet was seen to be flowing westward. Yet it was six weeks at least before the adventurers could embark on any affluent of the Columbia. The water was too shallow, too swift and rocky in gorges, too far from boatable timber. The charting of this continental divide fills half a dozen pages of Clark's foolscap, which are pasted zigzag, conformably to the sinuosities of the journey. Some legends are: "Camp at first creek," followed by dates of a score of others, each in place, and with each some suggestive word. "September 13, Hot spring, nearly boiling," is charted, and not far from it we read of another, "Cooks meat in twenty-five minutes"—but this latter entry was made a year after on the homeward march. Outward bound they here lacked meat. We read "Berry Creek" where they had no other food; "Hungry Creek" where they had nothing; "Kill colt," where they became hippophagous, though they could ill spare the weakest of their baggage-bearers. Mountains are sometimes marked "Pines," "Ragged rocks," but always "Snow." "September 15" (after fifteen days of portage pilgrimage): "Top of mountain—snow bank three feet high." The lines are few, but we read much between them: no fish in waters, no game tracked by argus-eyed hunters in brush jungles. The rats instinctively had quit them. The ultimate record is: 'Travellers' Rest," "Stopped to build boats. September 25-October 10."

At the mouth of the Columbia, Clark having reached a narrow neck of land which would serve for winter quarters, he says: "I marked my name on a large pine tree immediately on the isthmus"; and when homeward bound he marked it again on a natural obelisk near the spot where he found the Yellowstone first navigable. But he had unconsciously written a better sign manual. However pine, and rock, and paper in safety-vaults perish, the marks made by Clark's pen, mirrored and multiplied by photographic aid, will endure.

This cartography cannot be cheap, for it must be voluminous; Clark's fieldwork filling hundreds of sheets. Such an *édition de luxe* will find its niche in many a Carnegie library and others of similar aims, both public and private. It will be flavored with local interest not only at every town in the 3,096 miles which Clark traced up the Missouri, but in all mountains and prairies which he was first to pen. Such volumes ingrain new countries with the historic sense so strong in classic lands, and with nationality or patriotic inspirations.

THE NATIONAL ACADEMY MEETING.

WASHINGTON, April 23, 1904.

The National Academy of Sciences has just concluded an unusually full and lively session here, beginning Tuesday, April 19. The focus of scientific interest, which for so many years burnt in the question of the origin of species, is now decidedly shifted to that of the constitution of matter, and to the partly logical discussions of the fundamental principles of physics. The papers of Tuesday belonged mostly to this field, where nothing is more interesting than the marvels connected with radium, polonium, actinium, uranium, and thorium, on the one hand, and those connected with helium, neon, argon, and xenon, on the other. Concerning the former series, Professor Barker gave some new information, in a paper whose special object seemed to be to introduce the excellent term "autoluminescence." What is called "phosphorescence" (not a very scientific term, according to our present conceptions) is mostly either an accompaniment of chemical change or a prolonged fluorescence; and the term "fluorescence," originally applied to cases in which light is absorbed while in place of it light of another wave-length, mostly blue, is emitted, is now sometimes extended to cases in which the light emitted has the same color as that absorbed. But the term "luminescence" has come in to denote the general property of emitting light with hardly any heat and without apparent chemical change. In 1896, Becquerel discovered that salts of uranium have a property which was afterwards found to consist in their separating the molecules of nitrogen of the air into their ions, or electrified atoms; and this property is called radio-activity. In 1898 the salts of thorium were found to possess the same property. Mme. Curie ascertained, upon investigation, that different salts of uranium possess this property (which can be accurately measured by its electrical effects) in strict proportion to the amount of uranium they contain. Yet she found that pitchblende, the ore of uranium, is much more radio-active than pure uranium itself. It must, therefore, contain some other radio-active substance; and by chemical analysis she partially separated from it in 1898 a new element more radio-active than uranium, which she called polonium. A little later she found in the same mineral another new element, vastly more radio-active, which she called radium; and an assistant of hers has found in the same mineral still another radio-active element, which he calls actinium. These five radio-active elements stand in Mendeléeff's table of the elements at the foot of as many columns.

In March, 1899, Mme. Curie announced that, in addition to its radio-activity, or power of ionizing the air, radium possesses a different property, that of shining eternally without any excitation; and it is this property of luminescence without excitation to which Professor Barker proposes to give the name of autoluminescence. There is no proportionality between radio-activity and autoluminescence. The former depends entirely upon the amount of the radio-active element that is present; but "autoluminescence" is one of those physical properties which seem to require the presence of a small amount of some second substance. Professor Barker, for example, showed one specimen of a salt of radium whose radio-activity is 240 times that of uranium; and it shone so brightly as to be visible all over the darkened, but not quite dark, hall. Yet another specimen of the same salt, so pure that its radio-activity is eighteen hundred thousand times that of uranium, will show no light in absolute darkness.

No other substance than radium was known to be autoluminescent until November last, when Becquerel announced that uranium, also, was slightly possessed of this property. A tube of radium in which careful examination by the spectroscope had discovered nothing else but air, was found, after some months, to contain a quantity of helium; and substances emitting helium have been repeatedly found to be radio-active. Thus, the waters of the Bath springs, which, after suffering the derision of generations, have come again into esteem, were first found to contain helium, and then to be radio-active. There is every reason to guess that any radio-active substance would have an effect upon the health; as in some instances is well known to be the case. Water both from an artesian well and from a lake has been found to be radio-active, and some men of authority believe that all bodies are more or less radio-active, and that the new gases of which helium heads the list are products of radio-activity. Professor Barker exhibited the first photographs printed from their negatives by the light of ionized nitrogen, and very perfect landscapes they were. He also showed a photograph of M. and Mme. Curie and their daughter Adèle, taken by the direct light of radium. It was a little fogged, proving the intensity of the effect to be too great for practical photography.

Dr. Barker's paper was followed by an account, by Dr. E. L. Nichols, of a research by him and Dr. Ernest Merritt into fluorescence spectra. The spectrum in all cases presented a single maximum of light, shading off equally upon its two sides, so as to remind Professor Webster of the spectrum of an incandescent black body, and to suggest an inquiry into the effect of temperature upon the position of the maximum. Three papers presented by Prof. John Trowbridge gave excessively condensed accounts of as many extensive researches made in his laboratory upon the spectra of gases; one by himself that has occupied seven years, one by Dr. Theodore Lyman (son of the biologist) that has occupied five years, and the third, of great merit and difficulty, by the young Californian physicist, Dr. H. W. Morse. It is very much to be regretted that only nine or ten hours are devoted at the Academy meetings to the reading of papers, so that only fifteen or twenty minutes, or half an hour at most, can be devoted to single reports of the most elaborate investigations; and numbers have to be gabbled off at a faster rate than the mind can follow them, although without the numbers no real understanding of physical and physiological researches can be had. Professor Trowbridge has employed a storage battery of

twenty thousand cells, giving a spark of any length up to seven feet. His work was doubtless undertaken in the hope that facts would be brought out that might shed a light upon the constitution of matter, since the complexity of the spectrum of a gas (making due allowance for series of connected lines) cannot well be greater than that of the molecule that produces it. He finds that an electric current always acts to raise the vacuum, and thus tends to extinguish, and will ultimately extinguish, the light it produces. The hydrogen lines have a special tendency to disappear, and several phenomena go to show that hydrogen itself is an insulator, and that its apparent conductivity must be due to humidity. Professor Trowbridge declared himself to be quite assured by his own experiments, as well as by others, that the presence or absence of a line in the spectrum affords no indication whatever of a specially high temperature—a result very unfavorable to Lockyer's theory of "inorganic evolution," at least in its details. Dr. Lyman has been working upon the extreme ultra-violet part of the spectra of hydrogen and other gases, to which one millimetre's thickness of atmospheric air is absolutely opaque. Hitherto, one experimenter alone has ever succeeded in photographing these lines (the only way of observing light to which the eye is entirely impervious, even if the retina be sensitive to it). But Dr. Lyman has accurately measured the wave-lengths of the extremest lines which seem to exist, to 1,050 Ångström units—a feat that had been deemed impossible. Dr. Morse, with a most ingenious instrument, has photographed spectra of a Wehnelt interrupter. As an incidental result, he obtained in one photograph a flame-spectrum, an arc-spectrum, and a spark-spectrum; so that it would appear that these three kinds of spectrum may be produced by gas of the same temperature.

The only other papers of Tuesday were two, of characteristic ingenuity, by Professor Woodward, in one of which he proposed a peculiar form of pendulum for the absolute measurement of gravity, while the other gave a calculation from which it appeared that the effect of doubling the pressure of the atmosphere would be to diminish the radius of the earth by about 2 metres.

On Wednesday, the Academy received the sensation of the session in a report by Professor Chittenden of Yale on the results of his experiments upon the effects of reducing the amount of food, especially proteids, or nitrogenous food, to less than half what men ordinarily take. He began by rehearsing all the various dietary standards now ordinarily adopted, of which the best known is that of Voigt, who prescribes 118 grammes of proteids daily. Some go somewhat below this figure, others rise far above it. A Swedish standard calls for 189 grammes of proteids in daily food having a heat of combustion of 4,728 large calories. Atwater's American rule is 125 grammes of proteids with 2,500 calories for a man performing severe labor. But Mr. Fletcher has subsisted for many years upon half the proteids of Voigt's standard, with half the fuel value, and has remained all the time in most admirable condition. Now it seemed to Professor Chittenden that the various dietary standards merely show what men are in the habit of eating, and do not at all prove that they might not enjoy greater vigor if they ate less. In order to test the question, he experimented for six months upon twenty-seven men, of whom six were professors and instructors in Yale, thirteen were soldiers under military discipline, and eight were athletic students of Yale. Nothing was absolutely prescribed; there was no weighing out of the food except for the soldiers; but the men were desired in the course of a fortnight gradually to reduce the amount eaten, especially in the morning, so as to bring it down to about half of what it had been. It was, as Professor Chittenden expressed it, not prohibition, but temperance.

He began with himself in November, 1902, when he was a small man eating about Voigt's standard. In a few weeks, he reduced the amount by one-half; and after nine months his body weight had begun to be stationary. He then found that during six months his kidneys carried away 5.82 grammes of nitrogen a day, in place of the 16 grammes that they would have excreted under Voigt's standard. (It will be understood that the nitrogen so carried away is precisely the nitrogen that has been absorbed, the metabolic nitrogen, and is therefore the most important fact.) His health and efficiency seemed to be improved. Similar results were detailed for the other men of the first group. The thirteen soldiers were at first casting off on the average daily 16 grammes of metabolic nitrogen. After reducing their food in the course of a month, during the next five months the amount of 16 grammes was reduced to an average of 7.80 grammes. At the end of that time they had greatly gained in strength and courage, without any complaints of insufficient food. There was no change in their reaction-time nor in the blood, unless there had been a slight increase in the number of red corpuscles. The fullest possible data for each man were given in detail in the report. All the men of the third group were enthusiastic as to the good effect of the reduced ration.

Professor Chittenden entitled his paper "a preliminary report," and confined himself strictly to the facts observed and to the scientific conclusions from them, without indulging in any opinions as to what might be the ultimate consequences of the meagre diet. But the facts spoke for themselves, and undoubtedly produced a great effect upon the minds of all his non-medical auditors. Dr. Bowditch thought that they showed that the *optimum* of diet was nearer the minimum of nitrogen equilibrium than the maximum. He thought the digestive organs might under such a diet undergo a partial atrophy, and he would like to know whether the temperature of the skin would not be lowered, since otherwise it was difficult to understand how the heat of the body could be maintained when the fuel value of the food was so much reduced. Two other medical members of the Academy indulged their professional propensity to enunciate opinions in the customary highly impressive medical tone, one of them drawing a lesson altogether destructive of Professor Chittenden's facts from the feebleness of the Hindus, who subsist upon rice, while the other pronounced an equally magisterial dissent, grounded somehow upon the extraordinary strength, activity, and endurance of the Japanese, who subsist upon rice. There were other comments which showed mainly how surprising Dr. Chittenden's facts appeared to be to many members.

A paper by Dr. Horatio C. Wood, jr., read by his father, related to the drug Canadian hemp (*Apocinum cannabinum*), whose effects resemble those of digitalis. Professor Osborn, in the name of Dr. W. D. Matthew, gave an interesting account of the arduous studies that had been found requisite in order properly to set up the skeleton of a great sauropodous dinosaur, a reptile quadruped sixty-five feet long.

The papers of Thursday were of various sorts. The most remarkable was a discussion by Gen. Abbot of the disposition of rainfall in the basin of the Chagres River, with a view to estimating the force of the objections that have been raised to the plan of establishing artificial lakes in connection with the Panama Canal. For this purpose it becomes necessary to ascertain how much water percolates through the ground. By remarkably ingenious and solid reasoning, based upon the average monthly rainfall, evaporation, and discharge of the streams, with other data, the monthly state of the ground water was deduced, and it was shown that no danger is to be apprehended from the projected lakes. Professor Osborn gave some account of the recent palæontological discoveries of the American Museum of Natural History's exploring parties, which amount to a complete palæontological survey of the West. From this has resulted the overthrow of Clarence King's theory of a vast lake having formerly existed in that region, in which the animals whose remains are found perished. Moreover, it appears that, throughout the tertiary period, Europe, Asia, and North America formed a single zoölogical region. Professor Osborn argued not only that North and South America were connected by a bridge in the pleistocene, but that there was strong evidence of an earlier bridge during the cretaceous period. (Professor Agassiz, however, thought the evidence of this quite insufficient.) A fully developed armadillo had been found in Wyoming, and the edentates seemed to be as old in North as in South America. An animal resembling a crocodile had been exhumed in Montana. Three, and possibly four, collateral lines of horses had been clearly made out in the miocene, with very perfect specimens. Another paper by Professor Osborn related to the classification of reptiles. He argued that there were two grand divisions of these animals, which had been separated since the Permian age. One of these was characterized by having only one skull-arch, while the other had two. From the latter are descended all our present reptiles and also the birds. From the former, which was much more conservative in its evolution, were, nevertheless, descended the mammals and man, as well as the tortoises. This paper provoked no little discussion, but the value of the work was acknowledged on all hands.

Prof. A. T. Zahm, introduced by Mr. Alexander Graham Bell, gave an account of experiments for determining the law of the friction of the air at speeds below 40 feet per second. The experiments were well conducted, and led to a very valuable and simple formula, with which they accord remark-

ably well. Mr. Graham Bell gave an interesting account of his breed of multinipplèd sheep on his estate of Beinn Bhreagh. Mr. C. S. Peirce read a paper on the simplest possible branch of mathematics. A paper by Professor Newcomb on the application of new statistical methods to the question of the causes influencing sex, was announced, but was not read. On the whole, the session illustrated the progress of science in this country, for more than half a dozen of the papers were memoirs of high importance; which would hardly have happened ten years ago.

Correspondence.

OUTLINE OF PINCKNEY'S PLAN FOR A CONSTITUTION.

To the Editor of The Nation:

Sir: The readers of the *Nation* need not be told that historical scholars have long been interested in the work of Charles Pinckney in the Federal Convention of 1787. It is well known that the plan for a new Constitution attributed to him in the Journal of the Convention and also in Madison's 'Debates in the Federal Convention,' as commonly published, is not the plan which he really presented. Some years ago Mr. Worthington C. Ford called attention to this fact, and printed in the *Nation* (Vol. LX., pp. 398, 399) the letter which Pinckney sent in company with his so-called plan to John Quincy Adams in 1818. Shortly afterwards, Mr. Paul Leicester Ford published in this paper (Vol. LX., p. 459) an interesting comparison between the plan in the Journal and a pamphlet which was privately printed by Pinckney soon after the Convention adjourned. This pamphlet, styled by Pinckney 'Observations on the Plan of Government Submitted to the Federal Convention on the 28th of May, 1787,' purported to contain the speeches which he had made in the Convention at different times concerning his plan, which, it may be observed, was introduced May 29 (and not May 28, as he says). It was not difficult for Mr. Ford to show that, judging by the pamphlet, the plan in the Journal was not Pinckney's plan.

Quite recently, Professor Jameson, in a paper which received, as it deserved, a long and commendatory notice in the *Nation* (Vol. LXXVIII., p. 45), approached the Pinckney problem from a different point of view. After expressing his belief that Pinckney in all probability did not make in the Convention the speech which he published in the pamphlet, Professor Jameson endeavored to show what measures Pinckney favored, especially in the first half of the Convention's work, and he succeeded in presenting a number of distinct ideas which were advocated by Pinckney not in harmony with the pseudo-plan of the Journal. He also demonstrated that the so-called Pinckney plan was practically the report of the committee of detail "minus some of its lesser features, and plus some of his real plan." Among certain papers copied from among the Wilson papers in the Historical Society of Pennsylvania, he found also a sheet containing what evidently were extracts from the Pinckney plan, or, at least, propositions for which Pinckney was responsible. It ought to be said that Mr. Jameson did not have the opportunity of examining the original Wilson manuscripts.

In a recent examination of these, for the purpose of discovering their general scope and character, I found a plan of a constitution which had escaped the notice of investigators. A short inspection disclosed the fact that it could be nothing else than an outline of Pinckney's plan. It is given below. Space does not permit my furnishing the final and conclusive proof that this outline is what I have here stated. Those familiar with Pinckney's work in the Convention, and especially those familiar with Professor Jameson's 'Studies in the History of the Federal Convention of 1787,' will not long doubt the character of the paper. It is written in James Wilson's hand, and it either was taken down as Pinckney or the clerk read the propositions, or was a condensation prepared by Wilson himself from the plan on the clerk's desk.

Its value for students of our Constitutional history is greater than at first appears. It does something to rehabilitate Pinckney and establish his reputation for effective statesmanship. It seems to me to prove conclusively that Pinckney either made the speech printed in the 'Observations,' or, more probably perhaps, before going to Philadelphia, prepared the speech or large portions of it as a description of his plan; moreover, the speech and the outline as here given are mutually supporting, and, when taken together, enable us to speak with assurance as to what Pinckney proposed. We are now enabled to trace with considerable confidence the course of his propositions and to see which of his suggestions were finally embodied in the Constitution.

Lastly, and probably more important than all else, we are enabled to see the source of Pinckney's ideas, for there seems little doubt that, as far as powers to be delegated to Congress were concerned, he was much influenced by a report made in the Continental Congress in August, 1786. It may be that large portions of this report were embodied verbatim in the plan. Certainly some of the words of the report appear in the outline as here given. Pinckney, then a young man of twenty-eight, had part, possibly a leading part, in the preparation of this report. He was a member of the grand committee appointed to consider the alteration of the Articles of Confederation, he was chairman of the sub-committee which drew up the report that was accepted as the report of the whole committee; and the introductory phrases, as appears by reference to the manuscript papers of the old Congress, were written in Pinckney's own hand. We may therefore see an interesting and illuminating example of the fact, too often lost sight of, that the sundry efforts to amend the Articles, the sombre experience of the weary members of the Confederate Congress, had a direct and immediate effect on their work when, as members of the Convention, they undertook the task of constituting a new government and of overcoming the evils of the time. That Pinckney, the youngest member of the Convention, should have presented a plan on the same day that Randolph proposed the resolutions of the Virginia delegates, causes less surprise when we appreciate the important part he had been playing in the Congress of the Confederation.

One or two additional words are needed by way of annotation. In the fourth resolution there is, in the Wilson outline of the plan, no blank space before "thousand." Pinckney surely meant to leave a blank to be filled. In the fifth resolution, "annually" should have been written "septennially." Pinckney advocated a septennial term. Wilson could easily have made these mistakes either when condensing the plan as orally presented, or when taking notes from the copy on the clerk's desk.

1. A Confederation between the free and independent States of N. H. &c is hereby solemnly made uniting them together under one general superintending Government for their common Benefit and for their Defense and Security against all Designs and Leagues that may be injurious to their Interests and against all Forc[e(?)] and Attacks offered to or made upon them or any of them

2. The Stile

3. Mutual Intercourse—Community of Privileges—Surrender of Criminals—Faith to proceedings &c.

4. Two Branches of the Legislature—Senate—House of Delegates—together the U. S. in Congress assembled

H. D. to consist of one member for every thousand Inhabitants 3-5 of Blacks included

Senate to be elected from four Districts—to serve by Rotation of four Years—to be elected by the H. D. either from among themselves or the People at large

5. The Senate and H. D. shall by joint Ballot annually chuse the Pres^{t}. U. S. from among themselves or the People at large.—In the Presidt^{t}. the executive Authority of the U. S. shall be vested.—His powers and Duties—He shall have a Right to advise with the Heads of the different Departments in his Council

6 Council of Revision, consisting of the Presidt^{t}. S. for for. Affairs, S. of War, Heads of the Departments of Treasury and Admiralty or any two of them tog^{h} w^{t} the Presidt^{t}.

7 The Members of S. & H. D. shall each have one Vote, and shall be paid out of the common Treasury.

8 The Time of the Election of the Members of the H. D. and of the meeting of the U. S. in C. assembled.

9 No State to make Treaties—lay interfering Duties—keep a naval or land Force Militia excepted to be disciplined &c according to the Regulations of the U. S.

10 Each State retains its Rights not expressly delegated—But no Bill of the Legislature of any State shall become a law till it shall have been laid before S. & H. D. in C. assembled and received their approbation.

11 The exclusive Power of S. & H. D. in C. assembled

12 The S. & H. D. in C. ass. shall have exclusive power of regulating trade and levying impost—Each state may lay Embargoes in times scarcity

13 ———— of establishing Post Offices

14 S. & H. D. in C. ass. shall be the last Resort on Appeal in Disputes between two or more States; which Authority shall be exercised in the following Manner &c

15 S. & H. D. in C. ass. shall institute offices and appoint officers for the Departments of for. Affairs, War, Treasury and Admiralty—

They shall have the exclusive Power of declaring what shall be Treason and Misp. of Treason ag^{t}. U. S.—and of instituting a federal judicial Court, to which an appeal shall be allowed from the judicial Courts of the several States in all Causes wherein Questions shall arise on the Construction of Treaties made by U. S.—or on the Law of Nations—or on the Regulations of U. S. concerning Trade and Revenue or wherein U. S. shall be a Party—The Court shall consist of Judges to be appointed during good Behaviour—S. & H. D. in C. ass. shall have the exclusive Right of instituting

in each State a Court of Admiralty, and appointing the Judges &c of the same for all maritime Causes which may arise therein respectively

16. S. & H. D. in C. ass. shall have the exclusive Right of coining Money—regulating its alloy and Value—fixing the Standard of Weights and Measures throughout U. S.

17. Points in which the Assent of more than a bare Majority shall be necessary.

18 Impeachments shall be by the H. D. before the Senate and the Judges of the federal judicial Court.

19. S. & H. D. in C. ass. shall regulate the Militia thro[?] the U. S.

20. Means of enforcing and compelling the Payment of the Quota of each State.

21. Manner and Condition of admitting new States.

22. Power of dividing annexing and consolidating States on the Consent and Petition of such States.

23. The assent of the Legislature of States shall be sufficient to invest future additional Powers in U. S. in C. ass. and shall bind the whole confederacy.

24 The articles of Confederation shall be inviolably observed and the Union shall be perpetual; unless ordered as before directed

25. The said States of N. H. &c guarrantee mutually each other and their Rights against all other Powers and against all Rebellion &c.

Through the courtesy of the librarian of the Historical Society of Pennsylvania I am permitted to print the above outline.

INTEREST IN DRAMAS AND LENGTHENED POETRY.

TO THE EDITOR OF THE NATION:

SIR: In the last received number of the *Nation* was a suggestive note covering the supposed decline in general interest in dramas and longer poems. It is a question whether the steady sale of Shakspere, Milton, and the 'Faery Queen' is in proportion to the increasing number of readers—whether they at all hold the same proportionate place in the minds of readers as formerly. Nor is purchase always proof of reading or digestion. Bookbuyers are supposed to owe it to themselves to have certain volumes on their shelves. There are reasons on the surface why idealizing writers find it more difficult to interest us than formerly. History, the universe, we ourselves, are measured and probed as never before. Boyle O'Reilly's "Wonderful Country Far Away" is a charming though unavailing plea against such influences. Now, knowing the real conditions of life in the Highlands and in the Isles of Greece when Scott and Byron wrote, how can we be carried away by their poems as were the readers of their day? Biblical criticism has lessened the verisimilitude and damaged the prestige of such works as 'Paradise Lost' and 'Pilgrim's Progress.'

However little, if at all, nations in their collective action have bettered, a more humanitarian spirit is abroad. We see more real beauty and romance in "The Angelus" or "The Workers" than in the pictured nymphs and beauties of former days. Dramatic and poetic pieces can but weakly appeal to those who have realized the heroism that has been enacted in our own time. In the daily impact of telegraphic news from all quarters of the globe, how can the world to the same degree as formerly lose itself in fancy? Think alone of the real tragedy of the late war in South Africa, this raid upon Tibet, or, more striking than either, the race contest in the United States! The novel, dealing with the real facts of life and life's tragedy, is our best solace.

Yours very truly, ALFRED WEBB.

DUBLIN, April 13, 1904.

THE BOOMING OF HISTORIES.

TO THE EDITOR OF THE NATION:

SIR: A few weeks ago the readers of the *Nation* were enlightened by some correspondence concerning a certain 'History of North America.' Such facts as were brought out are particularly valuable to librarians, and I should like to ask if any of your readers can throw light upon 'The Historians' History of the World.' Why is a certain good weekly magazine booming it? Is it another case of the editor not being responsible for the advertising department? Has the day gone by when a history can sell on its merits? I wish every library would absolutely decline to buy books exploited in this way; but that, of course, is impossible.—Truly yours, LOUIS N. WILSON.

CLARK UNIVERSITY LIBRARY, WORCESTER, MASS.,
April 21, 1904.

THE BULFINCHES.

TO THE EDITOR OF THE NATION:

SIR: In your excellent editorial on "Tinkering the Capitol," in the issue of April 7, the name of Thomas Bulfinch, the writer, is very naturally substituted, by a slip of the pen, for that of his father, the architect. Charles Bulfinch, who designed the Boston State House and many other buildings in New England, was architect of the Capitol at Washington from 1818 to 1830, and brought the work to completion after Latrobe's beginning and its partial destruction by the British.

Thomas, one of the sons of the architect, wrote the well-known 'Age of Fable,' and other works for young people, and his name is probably more familiar, outside of New England, than his father's.—Respectfully,

ELLEN SUSAN BULFINCH.

CAMBRIDGE, MASS., April 19, 1904.

Notes.

A rather strained, not to say sensational, title has been sought for a new set of lives of American notables, "American Crisis Series of Biographies," to be published by George W. Jacobs & Co., Philadelphia, under the editorial direction of Dr. Ellis P. Oberholtzer, who will lead off with Lincoln. Brooks Adams will write the life of his grandfather, John Quincy Adams; Booker Washington that of Frederick Douglass; Professor Van Tyne that of Webster; Gaillard Hunt that of Calhoun; Lindsay Swift that of Garrison; Professor DuBois that of John Brown; Prof. W. E. Dodd that of Jefferson Davis, etc.

A second series of reprints of rare but also historically significant economic tracts, issuing from the Johns Hopkins Press, is projected, similar to that edited by Prof. J. H. Hollander, and again equipped with his introductions and annotations. The four now announced are all of the latter third of the seventeenth century; the first four were all of the nineteenth. The net price will be one dollar, and subscriptions are invited.

'Famous Battles of the 19th Century,' edited by Charles Welsh, is announced by A. Wessels Co.

'The Better New York,' by Josiah Strong, is to be published by the Baker & Taylor Co.

A. S. Barnes & Co. have nearly ready 'The Journey of Coronado,' by George Parker Winship (in their "Trail-Makers' Series").

Apropos of the recent notable engraving by G. Kruell after Ramsay's portrait of J. J. Rousseau, and of the Rousseau Archive and Society establishing in Geneva, M. J. Grand-Carteret is preparing for the Society a new Iconography of Rousseau (that of 1878 by M. Bachelin being a very imperfect though praiseworthy essay, based on the exhibition commemorating the centenary of Rousseau's death, in Paris).

Charles S. Newhall's 'Trees' and 'Shrubs of Northeastern America' have been combined in a single volume by Messrs. Putnam, of which the text and the plentiful drawings by the author are well calculated to assist those who seek to familiarize themselves with the forms and names of growing things. The "thirteenth impression" stamped upon the 'Trees' emboldens us to say that, in the fourteen years of public favor, errors pointed out by critics from the start merited attention and correction. Mr. Newhall still publishes that Hickory is "from a Greek word meaning round," but already he could have learned from the Oxford Dictionary that the name first appears as "perhickery" in Virginia in the middle of the 17th century. It was in this same century, too, that Europe first became acquainted with our Tulip-tree, yet we still read (p. 100) that this tree "was very highly esteemed by the ancients."

A new imprint has been made of G. Waldo Browne's 'Japan, the Place and the People' (Boston: Dana Estes & Co.), a work chiefly valuable for its 300 attractive half-tone picture and colored plates. These serve rather to throw in the shade the text, which is still agreeable reading. The author would have done himself more credit if he had been a little more generous to writers who preceded him by two-score years or more, who did the original research and supplied the substance of the information here so pleasantly reproduced. There are, however, some fresh impressions, and one or two new versions of famous old stories. The Japanese Minister at Washington furnishes a spirited introduction, which helps to show how nimbly the canny islanders in our century can reread their history in the light of Occidental phrase. He proceeds on the idea that things in Japan, as they are to-day, were substantially the same even in the millennium or more before the Japanese had any writing, or what the modern world would call civilization.

The second volume of the "Narratives of Captivities" undertaken by Burrows Bros. Co., Cleveland, reproduces the 'Captivity and Sufferings of Benjamin Gilbert and his Family,' carried off by the Indians, from their farm near Bethlehem, Pa., in the spring of 1780, and not too inhumanly treated, perhaps protected by their Quakerism. The editing has been entrusted to the competent hand of Frank H. Severance, who traces the Gilbert pedigree and adds a bibliography. The original Gilbert home-

stead (now included in Philadelphia) is still occupied by descendants, and a picture of it is here given.

A fair sample of the poet Cowley, on both his sides, is afforded in the latest addition to Methuen & Co.'s "Little Library," 'Several Discourses by way of Essays and Verse and Prose,' with a portrait. Mr. H. C. Minchen's introduction summarizes well enough Cowley's life, but will hardly compare with Leslie Stephen's sketch in the Dictionary of National Biography. Another volume in the same series is the 'Poems of Henry Vaughan,' edited by Edward Hutton. It is an all but complete collection, lacking the translations and a few fragments.

The relation between the decline in poetic production and in the quotation of poetry has yet to be worked out. Certain it is that one would be hard put to it to make a sequel to the ninth edition of Bartlett's 'Familiar Quotations' based on the verse uttered or passing current since 1891. Kipling, we suspect, would contribute most (for Mr. Bartlett had caught FitzGerald's Omar in his latest noose), and he is liberally drawn upon in Helena Swan's 'Dictionary of Contemporary Quotations' (London: Sonnenschein; New York: Dutton). The compiler frankly speaks of her collection as "breaking new ground" and "suggesting passages suitable for quotation," in her opinion. In other words, she has made an anthology, and has not been niggardly, as the volume consists of 600-odd pages, including the authors' index. She has made 1850 a dividing line, but with exceptions in favor of Tennyson, the Brownings, Bryant, Longfellow, Whittier, Lowell, and Whitman. Tennyson overshadows everybody. The first three Americans are about evenly matched in the number of selections; but Longfellow is entered as "William W." Dr. Holmes is absent. The only other names from this hemisphere are Aldrich, Will Carleton, Eugene Field, Bret Harte, Hay, Leland, Louise Chandler Moulton, and Buchanan Read. No Gilder, no Whitcomb Riley, no Woodberry. Mr. Stedman's American Anthology can hardly have been availed of. Thomas Hardy, Stephen Phillips, Watts-Dunton, William Watson, Alfred Austin, W. E. Henley, R. Le Gallienne, Alice Meynell, Lord de Tabley, are some of the British contingent which helps to make this collection welcome for reference or for enjoyment.

Armed with nothing more effective than first-class teaching certificates and a pleasant address, Lina Boegli, Swiss schoolma'am at Cracow, decided that she would travel round the world, taking ten years for the purpose and earning her living by her profession. This in 1892. In 1902, on the twelfth of July, she stepped out of the train at Cracow, it being the exact anniversary of her departure ten years before. Meanwhile she had lived and taught in Australia, Honolulu, San Francisco, and Ogontz, Pennsylvania. She had no serious adventures. Her letters have been made into a volume, 'Forward' (Philadelphia: J. B. Lippincott Co.). They are not remarkable for literary form, and, while pleasant reading for the friends to whom they were originally addressed, seem to have no particular reason for existing in print. There are two portraits of Miss Boegli, but, instead of being "before and after taking" her journey, they are both dated 1892. There is no index or even a table of contents. The only obvious moral of it all is that, in the present state of civilization, a lone female may go about the world as safely as she might go to market, provided she does not stray far from the ordinary routes of travel; and that, in Anglo-Saxon regions at least, everybody is, as a rule, disposed to be kind and helpful to her. This, after all, is not a small thing, and is worth recording.

'Fishing Holidays,' by Stephen Gwynn (Macmillan), is a self-confessed attempt merely to amuse, with no promise of instruction other than the reader may cull negatively from the conscientious record of stupid mistakes which the author himself has made. We like the book none the less for its fidelity to this description. Angling literature held up to strenuous standards would be as out of keeping as the over-strenuous angler himself. It is *aliquid remissius et dulcius* that one wants, such as Pliny's old friend Spurinna liked to have read to him in the hour of relaxation after his bath. We get from Mr. Gwynn's pages some refreshing whiffs off the lakes and hills of Erin, or, more narrowly, of Donegal, Kerry, and Connaught. He picks up many piquant incidents of Irish life and character by the way, and incorporates one first-rate Irish story of some length, 'St. Brigid's Flood,' which has already seen publication in *Blackwood's*. His aversion to worm-fishing is easily comprehensible in itself, but one is inclined to take it as a whim rather than a principle when he finds it side by side with a lurking curiosity to see a fish-hole dynamited just once. Whether the closing chapter is to be taken seriously or as a mere hoax, we confess our inability to determine. It is a tale of a leather fishing-bag, picked up by a collector in a Westminster shop, with the inscription carved upon the outside, "J. D. Anderson. From my Friend Izaak Walton. 1646." The alleged collector purchased it with no disposition to believe in the genuineness of the inscription, but a friend, upon examining closely the inside of the lid, which had been painted with a white enamel, now cracked with age, discovered the branded initials "I. W." Though the owner does not choose for the present to disclose his identity, we are assured that the relic is ultimately to be placed in some public collection.

'The Still Hunter,' by the veteran author and sportsman T. S. Van Dyke (Macmillan), is virtually a course of lectures on the art of hunting deer. It is to be hoped that similar books for other game will follow. Hunting the fleet deer on foot is no child's-play. Deer are so protectively colored that when at rest they are, to the untrained eye, practically invisible. When, however, the sportsman has sighted a patch of hide or a tine of an antler, his approach may well be indirect, preferably from above or under cover of a ridge. Patience, the author says, must be the still-hunter's cardinal virtue; hurry generally means flurry, and noiseless speed (an art in itself) is the only means to venison. When tracking, the hunter should not follow in the deer's footprints, but should bear off a few paces and read several rods of trail at a glance. Deer that have been jumped should not be followed. One must remember that the quarry at rest has a tremendous advantage over the pursuer in motion, and that when the conditions are reversed the animal loses the advantage. Realizing the value of repetition in teaching, Mr. Van Dyke forces the reader to follow again and again the processes of still hunting, until the entire routine becomes a habit of mind at least, if not of body. To put into successful execution all his directions at once without much actual practice, however, would be no less a feat than for the inexperienced photographer, relying on an exposure table, to make a good picture with a focussing plate camera on a tripod wabbling in the wind.

'Musk-Ox, Bison, Sheep, and Goat,' by Caspar Whitney, George Bird Grinnell, and Owen Wister (Macmillan), is the seventh volume of the "American Sportsman's Library" series. It is written for the hunter and the nature-lover, but is also truly scientific, though untechnical. Mr. Grinnell's account of the extermination of the bison, and Mr. Whitney's story of the killing of his first musk-ox, are excellent, amid much else that is good.

'Minute Marvels of Nature,' by John J. Ward (Crowell & Co.), is a collection of nearly two hundred microphotographs taken from both plant and animal subjects. The book has more interest for the microscopist than the biologist, because the text is a simple explanation of the photographs, and not a detailed biological exposition. Had the author used scientific names and technical language more freely, his work would have been more valuable to the student. It gives, however, much unpretentious instruction and entertainment for the general reader, and does credit to its author's skill and industry.

Some years ago attention was drawn here to the agitation conducted from Florence towards applying a Romanized alphabet to the colloquial language of Egypt. A new edition of these publications has now reached us—both the pamphlet in explanation and defence of the system, and a little Egyptian primer written in accordance with it for Egyptian speakers. But its authors seem hardly to realize how enormous would be the revolution they seek; the mere change of the direction of writing is appalling. That the Egyptian colloquial must and will assert itself as a literary organ is certain. It is moving in that direction already, or, rather, the literary language is moving towards it. But the change will come by slow development and not *per saltum*, however full of advantage for the Egyptian people a leap would be. It is unfortunate, too, that this system still kicks against the pricks by holding to its "j" for long "i" and by abjuring capitals. There is not a student of Arabic who would not be delighted if that language had some means of indicating its proper names.

Mention will suffice of the new edition, the sixth, of Maspero's 'Histoire Ancienne des Peuples de l'Orient.' The stout little volume now extends to 912 pages, but the greater part of that increase is due to 175 added illustrations. These are of the usual character, but the text itself has been brought thoroughly to date. The publisher is Hachette.

A List of Books on Arts possessed by the John Crerar Library in Chicago, October, 1903, has just been published in response to a request from the Industrial Art League of that city, in spite of acknowledged deficiencies in the collection. The arrangement is peculiar, but the classification and the index together will meet

the searcher's needs. The List will be found a valuable tool in any library.

Our trade with the Turkish Empire, and how it can be increased, is a leading topic in the Consular Reports for April, having particular regard to Asia Minor and Syria. It is an interesting fact that in this latter country camels as freight carriers are still able to compete successfully with the railways. The consul at Beirut writes that, "during the harvest, some 4,000 to 6,000 camels, each with a burden of 500 pounds of grain [wheat, barley, and corn], daily pass between the interior and the sea via Nazareth." He also quotes from a Levantine journal some tenders for material for the Hedjaz (Pilgrim) Railway now being constructed by Turkish soldiers between Damascus and Mecca. About three million dollars have been raised for it "by popular subscription among Mohammedans in all parts of the earth, including the Philippine Islands." Its length will be 930 miles. In the Daily Consular Reports of April 7 we read of the reforestation of southwestern France by means of the "pin maritime," according to Consul A. W. Tourgée of Bordeaux "the most remarkable achievement ever wrought by human agency in the modification of natural conditions of soil and climate for the benefit of mankind." The first trees were planted in 1800, and their success in resisting the desolating advance of the sand dunes was so great as to attract the attention of Napoleon, and the work was taken up by the Government. There are now nearly 700,000 acres of pine forests which not only protect the land, but are a source of great profit. It is now proposed to attempt to reforest the French Sahara by the cultivation of trees and shrubs adapted to its climatic conditions.

As the outcome of a series of articles on the first Western scholar to penetrate into the terra incognita of Tibet, the Munich *Allgemeine Zeitung* (Beilage No. 30) concludes that this distinction belongs to the German Jesuit Father Grüber. In 1661, at which date he was a missionary in China, Grüber went from Peking in company with the Dutch father, Dorville, and managed to make the first tour of investigation in Tibet. His report is still considered an excellent production, especially in reference to geography and in its description of the shrines of the country. It is known that Dorville died on the journey, and that Grüber returned to Europe by way of Smyrna. Professor von Richthofen, in his work on China, sketches this journey through Tibet, which, from the starting-point in Peking, covered two hundred and fourteen days.

The excellence of the Japanese in handling their battleships and torpedo boats springs not from good luck, nor is it the result of chance, as the report for 1904 of the Higher Technological School of Tokio suggests, though nothing whatever is said directly on the subject within the covers of this matter-of-fact pamphlet. The school is now in its thirty-seventh year, and has already graduated nearly a thousand men, besides teaching hundreds who took partial courses. Of these graduates 145 are experts in Government offices, factories or arsenals, 547 are engineers or foremen in private factories, 130 are instructors in industrial schools, 61 were in 1903 studying in foreign countries, 18 are in graduate courses, 29 are serving their time as conscripts in army and navy, 65 have died, and 24 are in unknown careers. The regular students, now numbering 473, take a course of four years in weaving, dyeing, ceramics, applied chemistry, mechanical engineering, electricity, or industrial design. There is also a training institute of industrial teachers with 119 pupils, besides 272 lads in the school of supplementary industrial education. With the native Japanese are 12 Chinese, 6 Hindu, and 2 Philippine students. Of the younger school of industrial teachers, there are, in the two sections, 210, and of the school of industrial apprentices (working in metal and wood), 246 graduates, most of whose careers are known, as turning their knowledge and skill to the good of society at large. The studies common to all the departments, seven in number, include (in addition to ordinary science and technology) ethics, bookkeeping, industrial economics, industrial hygiene, the English language, and military drill, and the hours of work number thirty-nine per week. The presiding genius of the institution is Mr. Tejima, educated in Philadelphia and at Lafayette College in the early seventies, repeatedly in charge of national expositions, now at the head of the contingent from Japan at St. Louis, and an enthusiast in the industrial upbuilding of the Japanese nation. He has been decorated by the Emperor.

A joint announcement of field courses in geology for the summer of 1904 has just been issued by Harvard, Chicago, Columbia, and Johns Hopkins Universities, and can be had on addressing the professors of geology in those institutions. This is in the interest of the earnest student of geology in any part of the country, who can now examine at his convenience all the best chances for summer field study, and make his choice from among them. It is to be noted that Yale, not offering any field courses of her own this summer, "will give credit to those of its students who satisfactorily complete any of the courses" in the announcement.

—Few sections of the Oxford English Dictionary (Henry Frowde) have we found slower reading than Dr. Murray's opening of P (to Pargeted) in the second half of Volume VII. Slower by no means stands for duller, but the contrary. The letter itself has a peculiar interest. "During its whole known history it has represented the same consonantal sound." Originally in Teutonic it stood for an Indo-European B of rare occurrence as an initial, and the few words thus beginning were perhaps not retained in Teutonic. In Old English the majority of words in P were adopted within the historical period from other languages, particularly the Latin, and still "P remained the smallest initial letter" (barring exotic K and Q); but in our modern vocabulary it is surpassed in bulk only by C and S. it has become preëminently English in receptivity from all the world's tongues, and is, to use one of its own vocables, the most Panhuman division of the alphabet, with the greatest number of unsolved etymological problems and its fair share of spurious words. P has a non-etymological function not without its bearing on spelling reform, viz., that of "indicating for the preceding *m* the short and semi-sonant value which *m* naturally has before pronounced *p*" (as in Simpson vs. crimson); much as *r* determines the sound of a preceding vowel, and is indeed lost in it as *p* in Hampton or Thompson. If we were accordingly to write Thomson only, a foreigner would be pretty sure to pronounce this after the analogy of crimson or damson (-zon). Again, phonetic reformers who wish to supplant *ph* with *f*, to the confusion of our alphabetizing, neglect the fact that "words beginning with PH have the same relation to the P words proper that those in CH have to the C words"; but it is not proposed, we believe, to separate the latter from the C alphabet.

—Greek prefixes cut a large figure in this section, with more to come. The little god *pan* has a considerable progeny, sometimes masked, as in Pambrittanick. R. Barker invented the moving scene, the Panorama, and the name, in 1789, and presently the language was enriched by a figurative use of the word. We cannot recall having heard Pantheon stressed on the penult, which Dr. Murray assures us is the prevailing English usage; but there has been a change from the stressed antepenult (the Greek original as well as Middle English and early modern English accentuation), and it is evident from the quotations that the poets have had a hand in this. However, that class of writers has an obvious interest in not foregoing the alternative. Pamphlet apparently derives from a diminutive of the title of a twelfth-century erotic Latin poem or comedy called "Pamphilus, seu de Amore"; if so, it briskly cast off its etymological implication. "An amatory pamphlet" no more offends by redundancy than "an economic pamphlet" does by incongruity. This is one of ten thousand admonitions to half-baked grammatical critics who repose upon the etymology, as when condemning the locution "*under* the *circum*stances." The first quotation (1547), in Latin, under Paraphrase refers to Erasmus's New Testament 'Paraphrases'; the second (1548), in English, is from Udall's translation of that work, and this great disseminator of Greek and Latin words in our modern speech comes to the front again in Parasite, and in Panacea (Udall and the 'Paraphrases,' but this word was glossed also in the 'Colloquies').

—The need of Continental "Oxford Historical Dictionaries" appears in the case of Parakeet, where Italian and Spanish forms intervene, but the relations between them "cannot be settled till the chronology is known." "Par excellence" is admitted by Dr. Murray as fully naturalized. "Papier mâché [oftener *maché*]" is, like "nom de plume," not of French origin. Paduasoy is not of English or of French formation, and is probably a corruption of *pou-de-soie*. Pageant is known only in English and the Anglo-Latin *pagina*, but the links to connect it with "page" or "leaf," or "stage" or "scaffold," are wanting. Another unique and excellent possession is Palter—no other language need apply. Pants, for trousers, is a clear Americanism; so might have been thought the rare substantive Parch, when Mrs. Whitney used it in 1874, but Stephen Phillips needed it in 1900: "the long road and the march, With the chink, chink, chinking, and the parch." Paddle, an oar, is first quoted from Captain John Smith (1624); "paddle one's own canoe," from Marryat (1844). To "paint the town red" is

assigned to the United States (1884). "Pa" goes here no further back than 1811. In England in the seventeenth and early eighteenth century the form of Papa "varied between *papa'* and *pap'pa;* from the latter the American *pop'pa.*" "At its first introduction from the French, courtly and polite, and used even by adults; long considered 'genteel'; but more and more left to children, and in the second half of the nineteenth century largely abandoned even by them."

—It frequently happens that real inspiration is furnished by a teacher whose disciples succeed in putting into clearer and more scientific form the ideas which remain rather vague and inchoate in his own mind. This may happen not merely in philosophy, but in its dependent branches as well—for instance, pedagogy. This remark is suggested by an admirable little book on 'The Place of Industries in Elementary Education,' by Katherine Elizabeth Dopp (London: P. S. King & Son; Chicago: University of Chicago Press). There is no subject on which it is so easy to write banalities—nor so difficult to avoid them—as education; hence one appreciates the more the thoroughly sound structure and the perfectly chosen style of this volume. As for its subject, it is safe to say that its importance cannot easily be overestimated, and not so much for its intellectual value as for its moral value. Boys brought up after the fashion here advocated will have their lives so filled with interests from their earliest school days that they will have no time to run wild, in the bad senses of the term; and girls will be rescued from their besetting sin of frivolity. We can only wish that this book may have the wide-reaching influence upon the makers of school programmes that it deserves.

—Lillian Pettengill's 'Toilers of the Home' (Doubleday, Page & Co.) is "The Record of a College Woman's Experience as a Domestic Servant." The narrative would have gained in effectiveness if the writer had acquired at her college a more orderly style. Vague phrases and vaguer statements confront the reader continually. The subject undoubtedly calls for a great deal of detail, but the mass which is set forth in the nearly 400 pages of the volume is overwhelming. Largely non-contributory to the purpose of the book, it fatigues prodigiously without enlightening in proportion. The gist of the matter is presented in the closing chapter, entitled "Afterthought." Here the writer makes a summing up, and offers at least two important suggestions. One relates to the advisability of non-resident service; the other, to "a union of the domestic workers—under wise leadership." Whether "a scab list of the impossible employers and the boycotting of the same" "would seem a wise provision," as the author asserts, might perhaps better be left to the "wise leaders" to decide. Her own year of service under five different employers she does not think of "as a time of unusual hardship even." "Yet," she adds, "I would not at all like the idea of settling down to that life of domestic labor for any length of time. The prospects for the worker are too dreary; the attractions are too few and too sordid." Obviously her conclusions, however painfully reached, were not drawn from an exceptional martyrdom. After many facts arrayed on both sides—for Miss Pettengill is fair, if full of socialistic theory—her last word is: "But the problem of domestic help unfolds to prodigious size. Far be it from Eliza even to pretend to know anything about it."

—M. J. B. Andrews has been studying the animism of the Sudanese negroes at Algiers, and has published his most interesting results in a tiny brochure, with introduction by M. René Basset ('Les Fontaines des Génies'; Algiers: A. Jourdan). Round the "Seven Springs" in the neighborhood of the Basilica of Notre Dame d'Afrique clings a strange survival of the primitive spirit-worship of Senegal, grafted on the Muslim belief in the Jinn, and hazed over, though very slightly, with a Muslim atmosphere. There the negroes gather in their fraternities, sacrifice fowls to propitiate angered spirits, burn incense, and fall into cataleptic ecstasies. They show another of the so numerous cases, now attracting attention, of an early, crude faith and worship, unconquerably asserting itself through all manner of changes. The tomb of the Marabout is the abode of the Jinni; and the Jinni is simply the elemental animism of Central Africa. The general situation is certain; to assign to each—Marabout, Jinni, and animism—its own is the rub. New in the conception of the Jinn is that they are so easily injured and crowd so round that careful movement is necessary not to hurt or kill them. This at last explains how the merchant in the 'Arabian Nights' killed a Jinni with a date stone.

LADY GREGORY'S CUCHULAIN.

Cuchulain of Muirthemne: The Story of the Men of the Red Branch of Ulster. Arranged and put into English by Lady Gregory. With a Preface by W. B. Yeats. London: John Murray; New York: Charles Scribner's Sons.

Mr. W. B. Yeats, at the beginning of his preface to Lady Gregory's volume, pronounces it in his opinion the best book that has come out of Ireland in his time—"perhaps the best book that has ever come out of Ireland." This statement, standing where it cannot fail to arrest the attention, rather challenges the reader to severe comparisons. But the discussion of it would be idle, and we shall not try to find a common unit for the measurement of Edmund Spenser, Dean Swift, and the translator of the Gaelic tales before us. We are content to say that 'Cuchulain of Muirthemne' is one of the best products of the present Celtic revival. We value the work chiefly because of its genuineness. Celtic literature, or an important branch of it, is here represented in its true character; and, since the time of Macpherson's ingenious "Ossianic" fabrications, no literature has been more often misrepresented. It has been known largely at second-hand, and the Celtic spirit has been judged too much by its peculiar and exceptional manifestations. Matthew Arnold's familiar essay, which from the nature of its subject laid stress upon these features, contributed in a measure to the misapprehension; and in the foremost present representatives of Celticism in English, Mr. Yeats and Miss Fiona Macleod, there is in our opinion considerable exaggeration of the qualities which commonly pass for Celtic. The mysticism and symbolism by which Mr. Yeats's verse is increasingly characterized are not essentially Celtic, any more than the sentimentalism of Macpherson. Elements of both mysticism and sentimentalism are present, it is true, in the ancient Welsh and Irish writings; but in most of the "Anglo-Celtic" literature these qualities have been cultivated out of all proportion. Lady Gregory's service to the English reader—and incidentally, as we believe, to Celtic studies—is that she has reproduced a body of Irish writings faithfully as regards their spirit and substance, and closely as regards even their letter. At the same time she has made a version which possesses freshness and beauty and sustained interest. On the basis of the English idiom spoken by the West Irish country people, she has worked out for herself a style not only well adapted to render the Gaelic, from which its own peculiarities are largely derived, but also very appropriate, with its occasional archaisms of vocabulary and its lingering tendency to parataxis, to be the vehicle of popular or traditional narrative. One might have feared that there would be a suggestion of vulgarity or illiteracy about such a dialect, and that it would therefore prove unsuitable for the tales of ancient kings and heroes. But Lady Gregory has given it a grace and dignity which dispel all such misgivings. On stylistic grounds alone she is to be credited with a very considerable achievement.

In commending the honesty of Lady Gregory's work, we do not mean to imply that she has taken no liberties with her originals. It is only for literary uses, not for scientific purposes or by scientific standards, that her work is to be called faithful. The very scheme of her book involved at the outset certain freedom in redaction. The sagas of Cuchulain were never combined into one chronological series in Irish, and in making such a sequence Lady Gregory had to suppress certain inconsistencies and in general to go beyond the warrant of her sources. She simply took a step which might have been taken at any time by an Irish redactor, and in doing so we hold that she has observed all proper restraint. A freedom about which we feel more hesitation is that which she has allowed herself in the treatment of varying versions of the tales. In the story of Cuchulain's birth, for example, she has put two accounts together in such a way as to produce a combination which can hardly represent the original form of the story. But even in this case, however much her procedure may impair her version for the uses of the critical student, no one will deny her right as a literary artist to make such modifications. Here again her changes do not affect the essential quality of the narrative. In her version of the tale of Deidre, however, we doubt the wisdom of her course on purely literary grounds. She has followed in good part modern Gaelic redactions, and we feel that there would have been a gain, both in consistency and in power, if she had adhered to the older forms of the story.

When allowance is once made for Lady Gregory's eclecticism in the treatment of her sources, she will be found to have dealt with her Gaelic texts as faithfully as one could ask. She has made no essential additions. Her changes have been practically all in the nature of excision and condensation; and though the critical student will be forced to consult for his purposes the Gaelic originals or literal translations of

them, we see no reason why the general reader should not be spared some of the iteration and excessive elaboration in which they abound. For modern taste the stories probably gain on the whole by Lady Gregory's condensation, though in some instances she has dispensed with characteristic passages which we should have preferred to keep. Thus, in the account of the "Wedding of Maine Morgor" (which is much reduced in Lady Gregory's version) the Irish text relates that, upon the approach of Maine and his retinue to the house of Gerg, the people crowded to see them so eagerly that sixteen men were smothered! This little feature, which occurs elsewhere, and may have been an habitual touch with the Irish story-tellers in describing a struggling crowd, is omitted by Lady Gregory, perhaps from a feeling of triviality. But the passage in question is no more extravagant than others which she keeps. In the description of the combat between Cuchulain and Ferdiad it is said of the wounded warriors that "if it were the custom for birds in their flight to pass through the bodies of men, they could have passed through their bodies on that day." Lady Gregory lets this stand, though it occurs in one of the most pathetic episodes of the great *Táin*, and we approve of its retention. Only we should be disposed to treat all such passages alike, for we regard them as particularly characteristic of Irish story-telling. We recognize, however, that Lady Gregory had to use her discretion on scores of similar points. One case of excision of a different sort, which we have observed, was certainly unfortunate. In the account of Cuchulain's delightful interview with Emer (on page 26) the passage of the original is omitted in which the task is imposed upon him of "killing three times nine men with one blow, and yet so as to save one man from each nine"; and later, on page 31, it is referred to as if it had been included.

Although Lady Gregory's text often adheres closely to the Irish for pages in succession, it does not purport to be a translation, and we have not undertaken to make a systematic test of its accuracy. One slip that we have noted is perhaps worth recording. Part of the point is missed in the explanation of the name of "Fand" (page 285) as "the tear that passes over the fire of the eye." "Fand" means simply "tear." The "fire of the eye" is the rendering of "Aedh Abrat," the name of Fand's father. Such errors as this do not matter greatly, and could be easily corrected in a later issue of the book. The same is true of little inconsistencies in spelling, perhaps mere printer's mistakes, like the variation between *Celtchair* (page 256) and *Celthair* (pages 254, 261, etc.). Irish proper names are likely to puzzle the reader enough at best, even if the same word is always spelled the same way.

All things considered, we hold Lady Gregory's work to be of great interest and value. She has succeeded in making an English rendering, at once beautiful and substantially faithful, of the principal cycle of Irish sagas. We are glad to see the announcement of a similar treatment of the Ossianic stories by the same author.

At the end of Lady Gregory's volume there is a note by Mr. Yeats on the "poet speech" of the ancient Irish and Norsemen. It is always a matter of interest when a poet undertakes, even casually, to define the essence of poetry. We may not learn anything new about poetry, but we are sure to get some light upon the poet; and Mr. Yeats's note, which suggests such a definition, is worth quoting, if only for what it reveals of his doctrine and temperament. He gives some account of the "Kennings" which were common to the poetic style of the ancient Irish and their Germanic neighbors, and defends them as marking "at worst an over-abundance of the esoterism which is an essential element in all admirable literature." Then he goes on to praise this "esoteric speech," which "brings the odor of the wild woods into our nostrils." We doubt if most readers of either Celtic or Germanic poetry will have associated the "Kenning," especially in its more developed forms, with the freshness of outward nature. But Mr. Yeats sees in it almost the heart of poetry, and sketches with reference to it a brief history of the imagination in literature. "The earlier we get," he says, "the more copious does this traditional and symbolical element in literature become." Greek and Roman culture, he holds, with its magnifying of man, set it aside for a while. But the earliest literature was all myth and symbol and enigma. Imagination was all in all. "Is not poetry," he asks, "when all is said, but a little of this habit of mind caught as in the beryl-stone of a wizard?" Thus he bases a plea for symbolism on the study of what is commonly regarded as an artificial element in Celtic and Germanic poetry. We do not mean to discuss his doctrine, which is in accord with the tendencies of some of his later verse. But we may say that we fear the effects of this theory of poetry just in proportion as we admire Mr. Yeats's rare poetic endowment.

COMTE'S PHILOSOPHY.

The Philosophy of Auguste Comte. By L. Lévy-Bruhl. Authorized translation [by Kathleen de Beaumont-Klein]. With an Introduction by Frederic Harrison. G. P. Putnam's Sons. 1903. 8vo, pp. 363.

Throughout the greater part of the sixth decade of the nineteenth century, there seemed to be some prospect—to many of those who were then laboring to render philosophy, and especially logic, exact and scientific, it appeared as a danger—that the philosophy of Comte, or the first section of it, might become as dominant as nominalism has been since the overthrow of scholasticism. This was feared, not so much because that philosophy was a tissue of contradictions from beginning to end, as because, while teaching the relative, temporary, partially false character of all human knowledge, expressly including the Positive Philosophy itself, nevertheless the very essence and soul of it lay in a recommendation not to pursue certain lines of inquiry, and in a disposition to bring brute force to bear to prevent those inquiries from being pursued. That was the very stamp of Comte. That was his catholicism. Nor were these prohibitions the result of long examination anxiously attentive to all that could be urged on both sides. They sprang, on the contrary, from just such one-sided thought and partisan blindness as produced the revocation of the edict of Nantes and other events of French history. While such a terrible danger was hanging over human science, those who felt it to be such were naturally unwilling to say anything that might be taken for an approval of Comtism. But now that that system is utterly exploded, and that it seems impossible that—in this country or in England, at least, where the sacredness of individualism is felt—there ever should arise any real danger to inquiry from inquiry itself, it is time to apply ourselves to learning what there is to be learned from the many pregnant suggestions of that extraordinary thinker.

France, during the nineteenth century, produced no philosophical ideas of greater value than Comte's law of the three stages of thought and his classification of the sciences. There was an obscure Dr. Charles Burdin, who died, we believe, during the fifties, from whom, it has been very positively asserted by reputable writers, Comte appropriated both these doctrines. It is impossible to believe that Comte was a conscious plagiarist; for even if his morals had been less strict than they were in literary matters, of all the victims of the plagiarist the easiest to delude is himself. But it is almost equally difficult to admit that such writers as those who repeat the charge should have done so without weighing their words.

To say that a broad philosophical conception is altogether new, is almost equivalent to a condemnation of it. That anybody has given it its definitive form can hardly ever be said. Comte's conceptions of the "theological," the "metaphysical," and the "positive," were very hazy, indeed. What he called a "theological" account of a phenomenon was a view which attached to the phenomenon one of the familiar ideas of human life—an idea in Hegel's naïve stage. A "metaphysical" account was one which regarded an abstract concept as being illuminative apart from its predictive value—roughly corresponding to Hegel's second stage. What Comte meant by a "positive" account was one which avoided doing what it has quite commonly been the triumph of science to do, as in the kinetical theory of gases, the oscillatory theory of light, the ionic theory of electrolytes, and the like—namely, to pass beyond the general formulation of facts to likening them to diagrammatical ideas, and thus to explaining them by theories which probably contain some admixture of error. Neither Comte nor Hegel sees anything to commend in this. Poincaré and his like are Comtists in this respect, while Bolzmann and the older physicists generally are of a contrary faith. But that there are three stages in the comprehension of phenomena is now generally admitted, whether this be a mere logical division, or represent a subjective tendency to divide by three, or whether it be an objective law, as Comte seems to think it is.

Comte holds, and it is generally too hastily admitted, that his classification of the sciences is, and can only be, the immediate offspring of his law of the three states. Dr. Arnott had already formulated essentially the same classification, with the same ladder-like relationship between the different sciences, without having any notion of three stages of any kind. There is quite another conception which differentiates the Arnott-Comte classification from all others. It is that the others are simply classifica-

tions of the different conceivable branches of knowledge. They are mostly classifications of the objects that can be known, and, moreover, almost all relate to what is possible rather than to actual fact. Every one of them is concerned with science either in the sense of ἐπιστήμη (*scientia*), or in Coleridge's sense of "systematized knowledge." This is true, for example, of Whewell, of whom one might have expected something different. But for Arnott and Comte a science is an historical development, the collection of those phenomena that are connected with the fact that a social group have been devoting their main energies to the pursuit of inquiries so closely allied that the persons who compose it understand one another, their conceptions and their sentiments, as it is impossible that others should. As soon as the word science is thus made to mean a congeries of actual phenomena, the sciences become susceptible, for the first time, of what we call a "natural" classification—that is, a classification which displays, in a useful way, the principal general relations which we have learned from observation concerning the more important resemblances and differences of the objects classified—in short, what, in a reformed sense of Comte's word, may be termed a *positive* classification. Now the fact which it seemed both to Arnott and to Comte to be most desirable that such a classification should exhibit, was the well-known fact that one science will very often depend upon another very largely for its axioms while contributing little to that other unless it be material for study. All classifications of the sciences that have been made since Comte's (some fifty in number) have been methodeutically useful pretty nearly in so far as they have recognized that principle.

Not only the 'Cours de Philosophie Positive,' but also the 'Politique Positive' and other of Comte's works, are brimful of thoughts that are *warm* (as they say in Hide and Seek) to living truths, although these are invariably most inaccurately analyzed and formulated. For example, nothing can be truer than that a hypothesis is good for nothing unless it is, as Comte says, "vérifiable," provided this means that the hypothesis is of such a nature that, if true, it will lead to correct anticipations as to the characters of percepts and diminish the number of surprises; but Comte's definition, that a verifiable hypothesis is one whose substance is of such a nature as to be capable of being itself directly perceived, makes his maxim an arbitrary and indefensible limitation of useful knowledge. The past, for example, is of its nature incapable of being directly perceived, and therefore, according to Comte (too literally taken), we ought not to believe at all that there ever was any past, and, as he proposes to give up the use of the word "cause" altogether, so he ought to have given up the preterit definite and indefinite of all verbs. Then his law of the three stages would relate in the main to nothing real, but to mere phantoms of the brain, and would fall under the interdict of the high priest of Positivism. He never attempts to define his ideas without similar failure.

Since M. Lévy-Bruhl's book, though its author is not a Positivist, carries the approval of Mr. Harrison, the leader of the remnant of the school in England (none of them very great minds, one infers from their writings), the rest of the world ought to be content with it. It is truly a useful compend, in which great attention has been paid to the accurate representation of Comte's opinions. We doubt its causing anybody whose philosophical opinions are important to think better of Comte than he did before, since the impression that it produces is that of a piece of special pleading, one-sided and insincere. We cannot deliberately suppose that it really is insincere, but we have in sundry places been tempted to think so. Upon the reviewer, who had not looked into Comte's writings for many years, and who may, perhaps, serve as an average sample of M. Lévy-Bruhl's readers, the effect of the book has been markedly to lower the reviewer's estimate of Comte and quite sensibly to raise his estimate of Spencer. It is a well-constructed work, and is written in a very agreeable style. The translation is also agreeable despite an occasional Gallicism, such as the oft-recurring construction "substitute to" (*substituer à*). The print and paper are agreeable, too; but the proof-reading is not excellent, and, where French occurs, is bad.

Imperial Fiscal Reform. By Sir Vincent H. P. Caillard. London: Edward Arnold. 1903.

This work is written from the Chamberlain point of view, and contains a large array of facts and figures regarding British industrial conditions, presented, however, in a manner not to afford the least indication that the present fiscal system of the nation should be abandoned. The burden of the income tax, the changed conditions of British industry in recent years, and the growing importance of other nations (such as Germany and the United States) in foreign markets, which the United Kingdom once considerd almost exclusively its own, do not call for the extended argument which Sir Vincent Caillard indulges in. No free trader will hesitate to admit the facts which he adduces, but he fails to produce the slightest evidence that these facts are the result of a mistaken tariff policy in the past, or that they can in any appreciable measure be removed by a resort to "imperial fiscal reform"—that is, to some form or other of protection.

Sir Vincent Caillard's treatment of his subject is sketchy, owing, no doubt, to the fact that his material is worked up very largely from a series of magazine articles. But, allowing for this, his book is strikingly devoid of anything approaching a synthetical grasp of the situation. He has signally failed to perceive what facts were germane to his argument, and what were not. For want of a proper correlation of the matter employed, he displays at no stage of his work any real intuition of the causes which are now, and which have been, governing British trade. In short, Sir Vincent Caillard jumps at conclusions in a way which fairly entitles him to the description of going off "half-cocked." This is amusingly indicated by his remarks regarding Mr. Morgan's shipping combine. He says:

"The American shipping combine of 1902—by which, as Mr. Elzbacher graphically puts it, America 'scooped off the ocean the very cream of our merchant fleet'—has made its appearance, and dealt a severe shock to our insular self-complacency. This sudden carrying of the commercial war into the heart of our country—the very region which had been so confidently pointed to as proof, in spite of all that might be said to the contrary, of the maintenance of our commercial supremacy, and the superiority of our fiscal policy—is the most patent evidence of the effect of the tariffs, subsidies, and trusts which are revolutionizing economic conditions, and of the futility of our pathetic constancy to free-trade principles to combat them. It was almost amusing to note the outburst of wonder at Mr. Morgan's audacity, the inflated panegyrics of his genius indulged in by his admirers, the dismal possibilities of his failure indicated by skeptics. But Mr. Morgan is only the personal expression of the economic conditions of the times—a 'Napoleon of finance' certainly, but in the sense that, as Napoleon in his time in the arts of war, so now Mr. Morgan in commerce, takes advantage of possibilities unperceived by old-fashioned academic critics in this country. These, following the exact precedent of Napoleon's adversaries in his earlier campaigns, elect to be bound by 'rules of the game' laid down by their ancestors under a totally different set of conditions, which they regard as orthodox principles and a departure from them as detestable heresy, and pour forth the vials of their incredulous wrath upon the brilliant general who outflanks and defeats them by perceiving the change in conditions and taking advantage of his perceptions. They absolutely decline to be instructed by history, and, because England has flourished by free trade under circumstances which certainly do not exist now, and which may never exist again, they resolutely turn their backs on the lessons which the study of a period previous to that of free trade might teach them."

Now Sir Vincent Caillard is possibly not to be blamed for taking the view of Mr. Morgan's shipping combine which so many of his countrymen took at the time. But the events of the last two years have shown the absurdity of that view; and the grotesqueness of enforcing an argument against free trade by a comparison with one of the worst fiascos among the industrial Trusts is apparent. The use made of this incident discredits Sir Vincent Caillard's whole argument. It indicates that he is not a cool, dispassionate observer of passing events, but a person predisposed to alarmist views.

Take another example:

"It might be, for instance—I do not say that it is actually the case, but it is not absurdly improbable that it may be—that the excess of imports partly represents repayment to this country of capital invested abroad. If this were so, it is clear that, although the increased imports mean increased well-being to the consumers, and therefore, apparently, increased wealth, nevertheless, since they consist of consumable commodities, the ultimate effect, in so far as they represent repayment of capital, must be the impoverishment of the country."

This is certainly an extraordinary bit of economic reasoning. How does the consumption of the imported commodities differ from the consumption of the capital they represent, when that capital, instead of being brought home, is left employed in foreign countries? In the latter case, it destroys itself in order to recreate itself in larger amount; and if it is brought home and consumed, it also recreates itself, unless dispensed in charity.

Again, speaking of the mutton export possibilities of Australia, Sir Vincent Caillard says:

"New South Wales, with 40,000,000 sheep, comparatively neglects the export trade in mutton, and keeps her sheep mainly for their fleeces, the carcasses being generally converted into tallow. It is, however, affirmed by official experts that, with im-

proved prices and proper cold storage accommodation, the export of mutton from Sydney would be largely increased by the substitution of cross-breds for merinos."

All this is said without any apparent regard for the consequences of allowing the merino flocks of Australia to deteriorate. The advisability of Australia's relinquishing her position as the great exporter of fine wools is not to be discussed with such flippancy.

A rather striking feature of this work is its author's attempt to ride two horses. He says that

"the taxes should not, if possible, be so high as unduly to increase the cost of living, since this would ultimately prove to be a tax on profits and a drag upon trade. On the other hand, the preferential duties should be sufficiently high to favor trade with the colonies. But there should be no intention of rendering the preferences so great as to cause the virtual exclusion of foreign goods. This might diminish the invaluable incentive of competition, and would unduly raise prices."

What Sir Vincent Caillard appears to mean is this: We must give the markets of the United Kingdom to colonial producers, and at the same time we must not shut out foreign goods; we must not tax foreign goods sufficiently to increase the cost of living, and yet we must tax them enough to allow a substantial preference in favor of the colonies. Of course, the outcome of any such policy as this would be, other things being equal, to raise the price of colonial produce almost as much as that of foreign goods. It therefore all comes back to this, How much of a tax would be needed to increase the cost of living? If experience teaches anything, it is that it will require only a comparatively small advance in the import price to raise the level of retail quotations. In fact, when it comes to the issue, Sir Vincent Caillard, like Mr. Chamberlain himself, fails to present a very creditable appearance. He says:

"I have not attempted to sketch out any system of preferential duties which the colonies should grant the mother country. Owing to the varying conditions, it is improbable that it could be uniform, and an intimate knowledge of every colony would be required to meet the views and possibilities of each, until inter-imperial free trade is established."

But is it not rather extraordinary that one should feel justified in advocating a revolution in the domain of admittedly the most complicated of all the sciences without first acquiring "an intimate knowledge" of the basic facts? This particular statement is only one of the many indications afforded by the work before us that Sir Vincent Caillard's preconceptions many times outweigh his command of essential facts.

The Standard of Pronunciation in English. By Thomas R. Lounsbury, LL.D., L.H.D. Harper & Brothers. 1904.

About a thousand years before Christ, the first examination in pronunciation was set by the men of Gilead at the passages of the Jordan. The test word was "Shibboleth," and more than forty thousand candidates, though their lives depended on not dropping the *h*, could not or would not conform to the Gileadite standard. Obviously, it was plain sailing for the purists when correctness was a question of superior numbers; nowadays one's adversary survives to confute one's pet pronunciation with a pronouncing dictionary. It is to be hoped that Professor Lounsbury's book will shake the touching faith in their Webster or Worcester that limits the outlook of too many intelligent persons. What he proves is, naturally, that there is no such thing as a standard of pronunciation, or, rather, that the standards are countless and incalculable, set up by every dogmatic individual who is more fixed in his preferences than his neighbors. In the matter of dictionaries, one who intends to be his own standard had better not run counter to them all—in fact, he would have to be prodigiously original to do so; but he can safely throw any one or two of these infallible works overboard. After all, it is surprising that there has been no more general inquiry by what special gift of divination the great Worcester arrived at his notions of correctness. He was born in New England, and there passed his life except for a brief foreign tour; he may have spent a month in England at the outside. What he really did was to consult all the pronouncing dictionaries in his reach, and go with the majority except in cases (and these were, of course, frequent) in which he preferred the usage of his associates. The timidity and the concessions of the modern dictionary prove that its compilers realize that we live in an age which no longer leans on the infallibility of the printed word. We are all now of the mind of Webster's New Haven parson: "What right has Webster," said he, "to dictate my pronunciation? He is one of my parishioners, and he ought to get his pronunciation from me, and not I from him."

In the struggle between Teutonic accentuation and classical quantity it is to be noted how regularly the latter gives way, at any rate if the word be taken into general use. But there is an occasional revulsion of feeling, and we have observed that a typical word of the kind, "metamorphosis," long pronounced, in spite of Macaulay, with a short penult, has, within the last two decades, shown distinct signs of recovering its classical quantity, at any rate in England, where the very similar word, "apotheosis," is regularly heard with a long penult; the victory of the antepenultimate is not altogether unquestioned. Once, however, a new fashion has set in, not all the wit and learning of a Macaulay can defeat it. "'Bal'cony' makes me sick," said the poet Rogers; just such æsthetic nausea would "balco'ny" produce to-day in a refined hearer. There is a section of English society which took the late Lord Winchilsea for a guide, and it may interest Professor Lounsbury to learn that if you should, in certain English houses, pronounce the word "chariot" as a trisyllable, or write "Marquis" for "Marquess," or fail to pronounce that word as though it were spelt "Markis," you would be promptly sacrificed to the memory of Lord Winchilsea. For there are in England strongholds which the Websters and Worcesters have never penetrated.

The general conclusions of Professor Lounsbury's concise and useful little volume are encouraging to all concerned. If you come from the country and speak of the "theayter," you are using the correct classical quantity; if you prefer the current usage of the overeducated, you are still correct, because in these things usage is law. If you are defending some private eccentricity and are confronted with Webster, you can make the retort with which Socrates silenced Euthyphro, inviting him to prove that *all* the gods agreed in a matter which among men was open to opinion. You, too, will be unanswerable if you decline any judgment for which your opponent cannot demonstrate a complete consensus of what Professor Lounsbury would call the "orthoepic" gods.

A Short History of Mexico. By Arthur Howard Noll. New edition. Chicago: A. C. McClurg & Co. 1903. 8vo, pp. 317.

From Empire to Republic: The Story of the Struggle for Constitutional Government in Mexico. By Arthur Howard Noll. Chicago: A. C. McClurg & Co. 1903. 8vo, pp. 336.

Of recent years there has been a great output of literature bearing on Mexico—most of it, unfortunately, of the tourist type, distorted and jaundiced. There is, indeed, real need for a reliable popular history of Mexico, and, notwithstanding the two books of Mr. Noll, the need is still unsatisfied. His second, which has to do with the nineteenth century, is in one sense an expansion of that part of the 'Short History' covering the same period, and very much improves it. In the 'Short History' the author set out to write a guide-book:

"he at first thought of offering his work to the tourists in Mexico, to aid them in enjoying the sights of that country. This idea was abandoned after the manuscript was in the hands of the publishers, in deference to the opinions of others that the book would be beneficial to the public generally, no less in need of such a history than the tourist."

The result is that we have neither guide-book nor history, but a potpourri of unnamable stuff. The work was first issued in 1890, and this purports to be a revised edition; but how it ever came to be printed a second time is the wonder of it. It is proof, at least, that the public has more interest in our neighboring republic than discrimination.

Mr. Noll sets out to portray the origins of the aborigines of Mexico, tracing the Aztecs from the "cliffhouses of Colorado and New Mexico" to the valley of Mexico, where, having seen "an eagle standing upon a *nopal* (prickly-pear cactus) strangling a serpent," they founded the city of Tenochtitlan—afterward the City of Mexico! From this one can judge how successfully this early and fascinating story is disposed of. The Conquest is discussed with no insight into the general history of the period. To attempt the narrative of it without some knowledge of the relation it bore to the expeditions that everywhere penetrated the coasts of the New World, from Labrador to the Orinoco, is to miss the mark completely. Separate it, if you please, from the larger world movement of exploration and colonization, but give us its setting in the history of Spain; it will lose none of its glamour. But even this is denied us.

Mexican history down to 1821, for Mr. Noll, is little more than a chronicle circling narrowly about the two and sixty viceroys who filled during the intervening space the viceregal chair of the kingdom of New Spain. The details of the Government; the christianizing of the Indians; the organization and development of the Catholic Church, with its relations to the political machinery; educational matters; social institutions, etc., concern but indirectly our

historian. Rarely does his gaze reach beyond the barrier of mountains which locks in the Aztec City; and if it does, the result is apt to be unhappy. For instance, we learn that one of the *two important* acts of Viceroy Marquina was the suppression of the Nolan expedition into Texas!

The history of Mexico in the nineteenth century is comparatively difficult. Mr. Noll's elucidation of it reflects perfectly the situation. Chapter after chapter is but a confused chronicle of revolutions. As for inaccuracies, a few instances must suffice. We learn (p. 121, 'Short History') that Texas was colonized by Viceroy de la Laguna, who "laid down the reins of government" in 1686; but Mission San Francisco de los Tejas, the first Spanish establishment in that quarter, was not made until 1690. The story of the outbreak of the Mexican Revolution *(ibid.*, p. 149), is utterly fictitious. It reports that either Aldama or Allende alarmed Hidalgo, with the result that he gave the *grito*. As a matter of fact, it was the wife of the *corregidor* of Querétaro who informed the Cura of Dolores of the Government's knowledge of his conspiracy. Astonishing, too, it is to find *(ibid.*, p. 156) that the four great leaders—Allende, Aldama, Jimenez, and Hidalgo—were shot on the same day, July 30, 1811. In his later book, 'From Empire to Republic' (p. 49), Mr. Noll reverses his own judgment, writing that the first three were shot in June and Hidalgo in July. This is all the more inexcusable since we are assured that the 'Short History' has been thoroughly revised. It is likewise with a shock that one discovers (p. 202, 'Short History') that Texas had 10,000 American settlers prior to the granting of Austin's *empresario!*

In spite of the formal bibliography (in 'From Empire to Republic'), it is perfectly clear that the author clung to his guidebooks. If he had taken the pains to go through the mass of materials collected by H. H. Bancroft; to sift 'Mexico atraves de los Siglos'; to study Bustamante and Alaman for the great Revolution; and to soil his hands with the dusty folios in the Biblioteca Nacional and in the Archivo General, we might have had a different story.

Recollections of a Royal Academician. By J. C. Horsley. New York: E. P. Dutton & Co.

The late J. C. Horsley, R.A., has rather slender titles to immortality in a malicious quip contained in Whistler's 'Gentle Art' and in certain dingy frescoes adorning the houses of Parliament. Possibly he better deserves to be remembered for certain excellent anecdotes imbedded in his posthumous 'Recollections of a Royal Academician.' These happy reminiscences were mostly taken down from dictation when Mr. Horsley was in his eighty-seventh year, and were set in order by a sympathetic hand.

At thirteen John Horsley was an art student, at fifteen a probationer and prize winner at the Academy schools. At sixteen one out of two portraits by him was rejected by the hanging committee of the Academy, a chagrin which in his seventy remaining years never befell him again. There was too little struggle in his upbringing. All along, the public thought too well of his anecdotal pictures. He painted the Queen's baby, the Princess Beatrice; and her Majesty came familiarly to the studio and compared babies with Mrs. Horsley. Her Majesty delighted in the story of Wilkie that,

"after making a sketch for composition with many figures in it, he would count the number and then the number of hands displayed; and if these did not amount to nearly a pair apiece, he would alter the sketch, feeling strongly that to omit a hand was deliberately to lose a vital point of expression."

Æsthetically speaking, all of Mr. Wilkie, of Mr. Horsley, of the Queen, and of Victorian art is suggested in the anecdote.

Indeed, Mr. Horsley was a peculiarly British compound of sociability, efficiency, culture, and provincial limitations. He met the best of his time, but remained a delightful Philistine to the end. It is perhaps this complete innocence of critical attitude that gives his recollections in old age great freshness and charm. To wield a deputy's billy in the Chartist riots, to have been a frequenter at Huxley's, though never feeling "quite at ease in discussion with him," to have ransacked England for twenty-seven years for the memorable winter exhibitions of old masters at Burlington House—all this bespeaks a very serviceable and beautiful nature.

One can forgive him a rather ridiculous crusade against painting from the nude, for his excellent anecdotes. For example, Horsley was at a Lord Mayor's dinner when his neighbor, Lord O'Hagan, was suddenly called upon:

"Up flamed the impetuous Irishman, no doubt remembering how strongly he had spoken to me about being requisitioned for impromptu speaking. He turned upon the toastmaster, and said: 'You, sir, go back to the Lord Mayor, and tell him from me that he is not justified in asking me or any of his guests to address such an assemblage as this without giving ample time for preparation.' Harker was equal to the occasion, and without a moment's hesitation replied: 'Prrupperation, my lord; why, if we were to give the gentlemen the time for prrupperation, they would speak all the evening!' "

Great men are seen in these pages only in passing: Felix Mendelssohn a familiar guest at Mr. Horsley's father's house; Vernet clambering up to the Institut de France in his cavalry uniform; Leighton similarly caparisoned for the Crimean war—at the lunch bar of the Athenæum Club; the Duke of Wellington's astonishment that, though his "double," a certain Mr. George Jones, was frequently taken for the Victor of Waterloo, *he* was never taken for Mr. Jones. But we must close a cursory notice of this agreeable book with the following amusing anecdote of the painter Cornelius. The scene is a Munich garden where, after a carefully planned luncheon, a young artist is exhibiting a great paper cartoon. Naturally, the guests, refreshed by much Hochheimer, and seated in the amphitheatre of chairs before the great design, await the master's verdict.

"Of course, every one waited for the great man to open his mouth. The sun was blazing on the picture, and Cornelius rose, open umbrella in hand, and pipe in mouth, in absolute silence, staring at an artistic performance *too bad for words*. The tension was becoming painful; the artist was jumping about explaining the points of the design, the perspiration rolling down his face, what with the heat of the sun and the excitement of the moment, heightened by the melancholy fact that not a solitary word of praise or satisfaction came from the invited guests. But every eye was upon Cornelius, then recognized as the leader of the art movement in Germany, who at last lowered his umbrella with the utmost deliberation, rolled it up, buttoned it, brought it down to his hip as if it were a musket, and, with a *pas de charge*, made for the cartoon, through which he burst and disappeared, and was seen no more that day. One after another the assembled guests rose, charged, and disappeared. The artist was left alone, or almost alone. He gazed at the awful hole, with its jagged and fluttering edges, through which his friends had vanished. He advanced, took his hat off, bowed to a few lingerers, pulled his hat over his brows, and himself went through the hole, amid the uproarious applause of all who remained near enough to the scene of action; thus, with infinite humor and good temper, putting the seal of his approval on the severe judgment of his artist friends."

La Corée Indépendante, Russe, ou Japonaise. By Villetard de Laguérie. Paris: Hachette & Cie. 1904.

We are not surprised to note that this author's brisk monograph, with its fifty rather cheap woodcuts, is in its second edition, for although he lived in Korea but a few weeks, he saw beneath the surface of things. In tone and value, the text is far ahead of the average book produced by the flitting swallows of literature. The point of view is, indeed, not that of the present year, although the publishers' date on the title-page is 1904. The author was special correspondent of the *Temps* during and after the Chino-Japanese war of 1894, and his latest comment is on the murder of Queen Min, concerning which event he is very full and illuminating. Considering Korea as "one of the last virgin lands of the globe," he was interested in visiting the country not merely to study it as a buffer state that for ages had stood between Japan and China, receiving the blows of each, but which was to be the silent partner in the still greater struggle between Japan and Russia—though this he did not foresee.

His very readable work is overloaded with allusions, and abounds in bright and amusing phrases not withheld from some of the heavier pages, which deal with statistics and comparisons. One cannot help regretting that he had not made himself familiar with Dallet's masterwork on Korea, which sets forth the real life and true currents of thought in the tiny empire. He contents himself, on the contrary, with a view of things as obtained in Seul. He is most interesting when he is talking about what he has actually seen in the country and among the people—for example, when he goes into the schools, which first nourish the youthful mind and then make it obese and dropsical with traditional Confucianism, so that at fifteen the average Korean is immensely "learned," frightfully ignorant, and hopelessly arrested in mental growth. One gets the idea of a whole nation suffering paresis. Yet the Korean mind, taken in youth, shows surprising responsiveness to science and reality.

Of the five parts of this lively monograph, one is devoted to what the author calls "the conquest of Korea by Japan" but although the chapter, "Japan Renders the War Inevitable," sounds rather thunderous, the proof that China herself did not begin the war by her violations of treaty is rather a whisper. After the Port Arthur and the Wei-hai-wei campaign of March, 1895, the author arrived at Chemulpo and began his

studies of the Land of Morning Radiance. He details the political doings of the Japanese in Korea, and gives a rather hasty view of the country before the Japanese occupation, flavored with sarcastic remarks about the high-salaried Americans in Government employ. He then shows how Count Inouye tried to reconstruct the corrupt Government, and how the envoy Miura upset, by his rude military ways, the delicate and wise work of his predecessor, "the white lily of Japanese statesmanship." The author treats fully and in the main judicially those tumults in the Korean capital which led to the murder of the pro-Russian Queen Min, to whose abilities he pays a deservedly high tribute. He describes also the flight of the king and his refuge for a year in the Russian legation. His final chapter, in which he shows himself less felicitous as a prophet than as a narrator, concerns itself with the question of the Far East. Very evidently, he does not know or understand the Japanese, and seems to share the notion that they are compacted of only Oriental stuff, and are destined to go the way of the other Asiatic nations in being subordinated to, or made subjects for conquest by, Russia or France or both in alliance. He thinks Korea is "a Morocco or Egypt of the Mediterranean of the Pacific," whose fate is at the dictation of Europeans only. Like most Continentals who have speculated on the future of the Far East, he seems unable to take Japan seriously. Hence he imagines (1895) that the whole question lay with "the Powers," and not between the little island empire and great Russia. Indeed, in vision, he thought he foresaw "in the streets of Seul what will be the end of the megalomaniac dream (*rêve mégalomane*) of the subjects of the Mikado."

The Citizen: A Study of the Individual and the Government. By Nathaniel Southgate Shaler. A. S. Barnes & Co.

To explain to young people the relations in which they stand to their rulers is a laudable undertaking, and we have nothing but praise for the spirit in which Professor Shaler carries it on, or for most of the counsels which he offers. The task, however, is harder than it looks. As Bagehot said, the invisible and unrecognized parts of government are the most important. They are like the steam which moves the engine; the machinery is conspicuous enough, and even the steam when it escapes after it has done its work. But the real work is done in secret, and its nature is not revealed to superficial observation. For these reasons many books on government are almost useless. They explain the statics of it, rather than the dynamics, and, after one has mastered all they have to tell, he may find himself, like Faust, little wiser than before.

It is possible that Professor Shaler has underestimated these difficulties. There are signs of easy, not to say careless, writing now and then. He quotes, as from the Declaration of Independence, the statement, "all men are born free and of equal rights"; and, having added an ambiguous word, he remarks that it is not clear what it means. He then asserts that the effect of the Declaration has been more marked among other peoples than our own. "Here it merely embodied in apt phrases what had long been firmly set in the minds of the people, . . . to the French, the American Bill of Rights came as a revelation of political gospel." Probably this statement would have struck Jefferson and Mirabeau with equal astonishment. Nor is it less surprising to be assured that the civil war did not alter the Constitution except in the extinction of slavery and of the doctrine of nullification. The doctrine of the Legal Tender decisions was revolutionary, and we have only begun to see its consequences.

On the fundamental question of party allegiance, also, the author expresses views which will arouse dissent. He thinks that our system of party government is based on certain fundamental qualities in human nature. All men are divided into two classes—the believers in centralized national government exercising a paternal control over the people, and the "strict constructionists," or believers in the freedom of the individual and the maintenance of the powers of local governments. Our two parties "are the indispensable agents of a democratic government. Every citizen should foster and respect them." This notion of a natural division of mankind is no doubt a very respectable tradition; but does it correspond with the facts? At the present moment there are probably more men supporting the Republican party who are intelligently opposed to its imperialistic tendencies, who are even free-traders, than are to be found in the Democratic ranks. They do not believe that the leaders of the Democratic party have any positive convictions as to the preservation of the liberties of the people; they know that these leaders are quite ready to adopt dangerous socialistic expedients. Most of them do not care for free trade or dare to advocate it if they care. They consent to our infamous pension laws; they do not protest against the awful burdens which militarism is laying on the poor; they encourage the labor unions in their despotic tendencies. Yet Professor Shaler mantains that our Congressmen are "naturally desirous of doing faithful service—except when self-interest prompts them overmuch, or when they have become mere servants of a party." Truly this is a large exception, as recent occurrences in Congress prove. Nevertheless, we are told that "the party whip has ceased to drive men as it did a few years ago," that the independence of the voters has so much increased "that in many States there is little influence left to the would-be 'bosses.'" We should like a list of these many States.

After all, Professor Shaler complacently observes, the state remains safe in the hands of either of the parties, and it does not make much difference which the young citizen joins, provided he acts honestly in making his choice. When he has made it, however, he is not to surrender his right of private judgment. He should refuse to vote for bad candidates; and in that way, if enough others agree with him, he may teach his leaders not to misbehave. Unfortunately, to refuse to vote for a bad Republican candidate may only bring about the election of a worse Democrat, and the leaders of both parties understand the situation perfectly well. They do not fret themselves because of good men who labor for "reform within the party." What they dread and detest is the genuine "Mugwump," who understands the motives which actuate politicians, and who does not respect or propose to "foster" either organization. When, if ever, a great body of citizens shall exist, holding itself aloof from the organized parties, and demanding specific measures of legislation and proper measures of administration, the tyranny of the politicians will be broken. Till then, the multiplication of citizens governed by Professor Shaler's doctrines will leave things very much as they are.

Not altogether as they are, however, for he truly says that the man who lives uprightly and tries to benefit his neighbors exerts a salutary influence on politics. The most substantial results are attained by those who make it their task to improve the conditions of their own immediate communities. In a little democracy like a New England town, these men are constantly selected to administer public affairs, and thus acquire real political power. As towns grow in size, this becomes less and less true; but perhaps even in large communities one can manifest his patriotism no more effectively than in devoting himself to such local reforms and improvements as there is reasonable hope of accomplishing. That vaguer, but easier and more captivating, form of patriotism which consists in wishing that our national policy may be directed according to our own standards of righteousness, is also not without effect; and Professor Shaler's counsels on this subject are enlightened and generous. In deploring the craze for military glory and dominion, in insisting on the barbarism of war and the cruelty of conquest, he speaks with impressive earnestness and in the interests of true civilization. Even if we do not altogether accept his historical and political generalizations, we can say that few young men would not feel themselves strengthened and elevated by the spirit of his teaching.

Studies in Dante. Third Series: Miscellaneous Essays. By Edward Moore. Oxford: Clarendon Press; New York: H. Frowde. 1903. Pp. xvi, 388.

An event of real moment in the history of literary investigation is the publication of this third part of Dr. Moore's scholarly 'Studies,' a work which deserves a place beside D'Ovidio's 'Studii' and Flamini's 'Significati reconditi della Divina Commedia' among the foremost contributions to Dante criticism. A considerable portion of the large volume is occupied by a full and accurate exposition of mediæval astronomy and geography; although nothing new is here proposed in the way of interpretation, many difficult passages are made clearer than before, and Dante's conception of the material universe is presented in coherent fashion. More important, though shorter, is the discussion of the assumed date of the vision—an absolutely conclusive argument for the year 1300, and an equally unanswerable refutation of Angelitti and of the other advocates of 1301. The question is treated with perfect fairness in all its bearings, and it is hard to see how anything more can be said on either side.

"The Apocalyptic Vision" and "The Reproaches of Beatrice," while they contain nothing strikingly novel, exhibit the author's usual thoroughness and intelligence, and form an interesting commentary on the closing cantos of the "Purgatorio." A few

of his opinions, to be sure, are likely to be contested: for instance, the assumption of a series of seven distinct catastrophes to the Church, the explanation of the attack of the dragon as Mohammedanism (the Greek schism not being mentioned), and the theory that the seven heads on the chariot represent the Electors of the Empire. One might wish, moreover, that in the second of these chapters Dr. Moore had made more account of Dante's lyric poetry, which he seems, here and elsewhere, to have strangely neglected. A note on Matilda urges once more the claims of the Countess; the possible identification of this girlish spirit of Eden with the youthful *donna gentile* of the window is perhaps too lightly dismissed. In the study of the word *brolo*, the footnote on p. 217 shows a failure to discriminate between pronunciation and spelling.

"The DXV Prophecy," which has seen the light before, will doubtless find more admirers than believers. Wonderfully ingenious it certainly is, and nobody can rightfully deny it a fighting chance; but it puts one's credulity to a severe test. The hypothesis advanced is this: Dante's coming Avenger, who is called "515," or *DXV*, is Henry VII., and his name, in the form *Arrico*, can be spelled out of 515 by ascribing to the letters the numerical values which they had in Hebrew, after the fashion in which the Apocalyptic "666" has been deciphered. Dr. Moore makes it evident, by the way, that Dante might easily have known these values. To accept his view, however, we must admit that the "Purgatorio" (or at least this passage) was finished as early as 1312 and that the prophecy was left unchanged after Henry's death; that Dante ascribed to *o*, which he did not find in the Hebrew alphabet, an arbitrary equivalent of 4; and that, having at his disposal the current forms *Henricus*, *Enrico*, and *Arrigo*, he chose to operate with a non-existent, or at least excessively rare, *Arrico*. This last supposition is the most unlikely of all, inasmuch as the familiar *Arrigo* fits the Hebrew alphabet even better than *Arrico*. Dr. Moore is surely mistaken in assuming that *Arrigo* presupposes *Arrico* as a more primitive stage.

Likewise open to criticism, though entirely reasonable in its method, is the concluding essay on "The Genuineness of the Dedicatory Epistle to Can Grande." In a peculiarly minute and systematic examination the authenticity of the letter is defended and the opposing arguments of D'Ovidio are answered one by one. A telling bit of evidence is the identity of Dante's apparent sources for the "Paradiso" with the authorities cited in the epistle. The general conclusion, stated on pp. 361-362, is quite plausible, though too complicated to quote here. It must be said, however, that in all this controversy neither party has advanced an argument that can be called convincing. Furthermore, most of the participants—including Dr. Moore—have given little heed to the most suspicious blemish in the epistle, the fundamental inadequacy of its treatment of allegory.

Young's Italian Grammar.

By Prof. MARY VANCE YOUNG of Mt. Holyoke College. 278 pp., 12mo, $1.25 *net.*

The essential points of Italian grammar presented as briefly as is consistent with thoroughness, but with more detail than in the other Italian grammars now in use in America. Each chapter is accompanied by two or more exercises of connected narrative, which are grouped at the end of the book. The vocabulary employed has been restricted as much as possible so as to illustrate and impress the grammatical construction without distracting the pupil's attention by a large mass of new word-material.

HISTORY OF THE
UNITED STATES OF AMERICA

By HENRY WILLIAM ELSON
Author of "Side Lights on American History," etc.

Cloth, 12mo, $1.75, net.
(POSTAGE 24 CTS.)

Convenient: There is no other equally comprehensive and generally available history of the United States in the compass of one 12mo volume.

Accurate: In its references to all matters of fact, it is in line with the results of the best and most modern research.

Interesting: Well-proportioned in the fullness of its treatment, with clear-cut sketches of men and vivid pictures of life and times.

A NEW VOLUME IN **THE AMERICAN SPORTSMAN'S LIBRARY,** *edited by* CASPAR WHITNEY

AMERICAN YACHTING — By Mr. W. P. STEPHENS

The background of the story is the long struggle for the possession of the America Cup, which has been the dominant factor for many years in both the sporting and the technical side of yachting. The personalities of leading yachtsmen, their influence upon design and construction, and their efforts toward furthering the popular interests of the sport.
Cloth, crown 8vo, gilt tops. $2.00 net. (Postage 15 cts.)

NEW NOVELS

The new book by the author of "The Call of the Wild."

Mr. JACK LONDON'S
The Faith of Men

Virile, pungent stories of the primitive passions; a return to the line of the author's first and best work.
Published this week. Cloth, $1.50.

The best novel of Western life, in paper covers, at 25c.

Mr. OWEN WISTER'S
The Virginian

In good type, printed from the same plates as the original expensive edition. *Published this week in Paper, 25 cts.*

ONOTO WATANNA'S
Daughters of Nijo

By the author of "The Heart of Hyacinth." This is an exceptionally dainty love story, and moreover well expresses the characteristic life of the Japanese Court. Illustrations and decorations in color by KIYOKICHI SANO. *Cloth, $1.50.*

Mr. SAMUEL MERWIN'S
The Merry Anne

is the story of a young captain on the Lakes, suspected of smuggling. There is a charming love interest, and the whole story is told with a crisp freshness and power of description worthy of its spirited plot. Illustrated in color by THOMAS FOGARTY. *Cloth, $1.50.*

By H. SHERINGHAM and N. MEAKIN
The Court of Sacharissa

has been "compiled from the traditions of the irresponsible Club." It is a graceful piece of delicate fooling, delicious in its humor. The *New York Tribune* calls it "demurely droll, capricious, poetic, and charming." *Cloth, $1.50.*

Mrs. FLORENCE MORSE KINGSLEY'S
The Singular Miss Smith

A clever hit at modern social ideas, as seen by a woman with a keen sense of humor. It is a distinctly attractive love story and its heroine's solution of the problem "how to become a social success" is very amusing. *Cloth, $1.25.*

AS ENTERTAINING AS FICTION

Dr. JOHN W. STREETER'S
The Fat of the Land

"It is as fascinating as a novel, . . . exasperating, because it awakens envy. But it is also charming, and should be enthusiastically recommended."—*Cleveland Leader.*
Third Edition. Cloth, 12mo, $1.50 net. (Postage, 12c.)

Mrs. THEODORE THOMAS'S
Our Mountain Garden

"One cannot help liking the unspoiled personality revealed in its pages, nor can any one with an iota of nature-love fail to respond to its unforced enthusiasm. It has in it the tonic of mountain breezes."—*The Record-Herald, Chicago.*
Cloth, 12mo, $1.50 net. (Postage 13c.)

G. P. PUTNAM'S SONS, 27 W. 23d St., N. Y.

SCHOOL TRUSTEES, PRINCIPALS, TEACHERS,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

The *Nation*, in its special field of political and literary criticism is unlike any other periodical, American or foreign. About 10,000 copies are circulated weekly, but these figures do not accurately represent the number of its readers. It is taken by reading clubs and literary associations in a large number of places, and may be found on file in every library of importance in the country. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters.

Advertising rates, 15 cents a line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12½ per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

NEW BOOKS OF PERMANENT VALUE

APOLOGETICS **Or the Rational Vindication of Christianity.** By FRANCIS R. BEATTIE, D.D., LL.D., Professor of Apologetics and Systematic Theology in the Presbyterian Theological Seminary, Louisville, Ky. Introduction by BENJAMIN B. WARFIELD, D.D., LL.D.

Dr. WARFIELD says of this work: "The first work by an American Presbyterian which surveys the whole field of Apologetics. . . . develops with sanity and serenity its entire content."

8vo, 605 pp. Net $2.00; postage 25c.

PIONEERING IN CENTRAL AFRICA By Rev. SAMUEL P. VERNER, Member of American Society for Advancement of Science.

"'Pioneering in Central Africa' needs must be a good book to rank with Bently's 'Pioneering on the Congo' and Coillard's 'Threshold of Central Africa' and Stanley's 'Dawn of the Dark Continent,' but it is not unworthy to stand beside these remarkable productions."—*Interior, Chicago.*

520 pp. Illustrated. Net $1.75; postage 25c.

LIFE AND LETTERS OF ROBERT LEWIS DABNEY, D.D., LL.D.

By THOMAS CARY JOHNSON, D.D., LL.D., of Union Theological Seminary, Richmond, Va.

"The story of the life of Robert Lewis Dabney is likewise the story of the South in her most critical days—the South in war and reconstruction. Whoever, therefore, reads this biography, will find himself studying the life of a representative Southerner, but first of all that of a great religious thinker, a theologian, and a prophet and teacher as well, far-seeing, clear-sighted, true to principle, and ever cognizant of the movement of the Almighty Hand in building and yet again in rebuilding."
—*Boston Evening Transcript.*

The Nation.

NEW YORK, THURSDAY, MAY 5, 1904.

The Week.

President Roosevelt could do no other than stand by his appointment of Dr. Crum as Collector at Charleston. Until the Senate decides otherwise, he is bound to suppose that a man against whom no other charge was ever brought, will not be kept out of office simply because his skin is not of the desirable shade. Hence the prompt recess appointment of Dr. Crum is simply the President's way of asking again whether the door of opportunity is or is not open in this country to negroes of education and good character. The Senate must answer. At the same time, Mr. Roosevelt cannot complain too bitterly because the Senate would not act. It was a case of the fetish, "Senatorial courtesy." Senator Tillman was absent, so how could an appointment in his State possibly be considered? As the President himself is, by his method of appointing to office, one of the greatest upholders of Senatorial courtesy, he is defenceless when its edge is turned against himself in this way.

The statements made in the Senate and House on Thursday regarding the appropriations of the late session of Congress are ominous. It is all very well for the Republicans to claim that the authorized expenditures for next year will be only $698,272,786, against $727,474,206 estimated by Secretary Shaw, and that, instead of the deficit of $23,002,146 predicted by the latter, there will be a surplus of $6,199,274. But this is very far from revealing the true situation. Senator Allison had to admit that the appropriations of the last session were $28,000,000 above those for the present fiscal year, as estimated. There is also an increase of $8,832,000 in the permanent annual appropriations. To the $698,272,786 of authorized appropriations must be added $26,801,843 to pay deficits for prior fiscal years, and $56,500,000 for the sinking fund, making $781,574,629 in all. Secretary Shaw estimated next year's revenue at about $704,000,000, which is $77,000,000 less than the authorized and the permanent appropriations. It is hoped, of course, that the revenue will run ahead of the estimates and make good part of this discrepancy; and it is also expected that considerable money granted for the coming year will not actually be expended until a later period. But the present receipts of the Treasury certainly cast a damper on the hope of excess in revenues.

Where are we going to stop? The British people, who have been pursuing exactly the same policy as ourselves, have become seriously alarmed over their expenditures; our complacency is still undisturbed. But it is worth noting that our extravagance is of the same order as theirs. The army and navy are swamping them, and the army and navy are devouring our substance at an alarming rate. Next year we propose to spend $8,000,000 more on the former than this year, and $16,000,000 more on the latter. Senator Aldrich may cry Peace, peace! but there is no peace—that is, no peace-footing for our military establishment. He has been hoping for it ever since the Spanish war, but sees it recede farther into the distance every year. During the last fiscal year Great Britain spent $144,500,000 on her army. Secretary Shaw's estimate for 1905 was $125,600,000. Great Britain devoted to her navy $184,500,000, and the Treasury's estimate for us was $103,600,000. Considering the size of the British Empire, and the fact that its navy is intended to be equal to any two fleets of other nations, our pace is out of all proportion. The total expenditures of the Roosevelt administration have been $211,000,000 greater than those of Mr. McKinley's four years, and $883,000,000 larger than those of Mr. Cleveland's last term. Speaker Cannon might well say, as he said in the House in 1897, that the President should exact of his Cabinet "some degree of wholesome effort in the direction of public expenditures, to the end that Congress may not have to strive unaided and alone towards bringing our public expenditures within the sum of our public revenues."

Speaker Cannon received from the adjourning House such a tribute as probably no predecessor of his in the Chair was ever offered. In sheer intellectual greatness, in dashing leadership, in service to the country, many Speakers would come before Mr. Cannon. Blaine was far more brilliant; Randall was more massive; Carlisle more serenely and judicially impartial. Speaker Randall, by standing like granite against the wild dashings of his own party in the House, when it would have refused to carry out the findings of the Electoral Commission in 1877 and plunged the land into civil war, performed a public service beyond anything that ever fell to Mr. Cannon's lot. But none of the Speakers we have mentioned, or any other occupant of the Chair, could ever have got this unanimous election as Prince of Good Fellows. Speaker Reed might have come near it had not his mordant tongue and the fierce party controversies he aroused made men forget his abounding bonhomie. What endears Mr. Cannon to his colleagues on both sides of the House is not simply his fairness and unfailing good humor, but a quaint and picturesque quality all his own. What in another would be affectation or posing is in him the spontaneous overflow of a very sincere and rugged nature. His odd phrases go with a certain sort of whimsicality of mind, while his homely simplicity and directness breathe the genuine man. There is method, too, in his homespun bluntness. He gets things done that the masters of strategy and circumlocution would fail in. A few days ago, when the Democrats had caught the Republicans at the races, and left it doubtful if the majority party would not be outvoted, Speaker Cannon took the unprecedented step of having the roll called a third time. Mr. De Armond promptly made the point of order that this was against the rules, but the Speaker said: "The Chair will be very frank with the gentleman. The Chair is hoping that two or three more members will come in." The irregularity was lost sight of in universal laughter.

"In our own time and our own way," as Senator Lodge pithily put it, a postal investigation is to proceed. Holmes Conrad and Charles J. Bonaparte, with the possible assistance of Department officials, will continue their researches. No one doubts, so far as Messrs. Conrad and Bonaparte are concerned, that they will be relentless; but it is hardly possible that they can give the whole Department such an overhauling as the Democrats in Congress demanded. As yet nothing is said about the railway mail service, which has long been open to grave suspicion. Tactically, an investigation under the President's eye will be an advantage to the Democrats. They can assert, and with a show of reason, that the Republican majority in Congress was afraid to take the matter up exhaustively; and that so long as the scandals are kept quiet and within the family circle, the people do not really know the extent of the frauds. Many voters are already turning from the Republicans because of corruption and extravagance; and the party can ill afford at the beginning of the campaign to add to the burden of suspicion.

It is said that Secretary Shaw expects to pay $27,000,000 of the Panama Canal money out of the depository banks, and the remainder of the $50,000,000 out of the Treasury. But has all this cash yet to leave the country? What Wall Street desires to know is whether the $17,000,000 of gold already ordered for export this spring represents, to any consid-

erable extent, the canal payments, or whether, in addition to this sum, $40,000,000 more must be shipped to France, to say nothing of the $10,000,000 due the Isthmian Government. From the point of view of our own money-market needs these are questions of some moment. But of equal interest is the effect of the payments on the European situation. It is said that Paris fears that such a large influx of gold will have a disturbing influence. Wall Street is puzzled to know just what this may mean. The only disturbing effect of the large receipts of gold on the financial situation would be an increase of speculation, and it is hardly likely that Paris would object to that. With such an enormous amount of public loans waiting a market as at present, there is every reason why a great addition to the gold supply of Europe should be welcomed.

The World's Fair at St. Louis, which was formally opened on Saturday, resembles its predecessors in being as yet only the earnest of an exhibition. A little more time will make the promise good, will fill the vast buildings with exhibits from the four quarters of the earth, and will replace the trodden ground with grass and parkways; but the general dilatoriness of such exhibitions certainly throws into sharp contrast with the tardiness of the commemoration the promptness of the act commemorated. There was less delay and circumstance in extending the United States from the Gulf of Mexico to Puget Sound than there has been in erecting the group of buildings that recalls that event. But this means not that we are more slothful than our fathers; rather that their deed has grown so tremendously in significance that it is difficult to make our retrospective tribute adequate. St. Louis at least has spared no effort to make her exhibition worthy of the event that assured the Continental preponderance of this nation. The country may now judge how far she has succeeded.

The strike of more than 1,400 bakers in Boston and surrounding cities is surprising. One wonders that Mr. Gompers did not show the Boston bakers what an unwarlike move this would be. It is much like an army deliberately denuding its base of supplies. Even labor unionists have to eat, and they are among those who will suffer most from the bakers' strike. The daily output of bread in Boston is over 300,000 loaves. Most of this amount is eaten by people of small means. The large hotels and restaurants will not be affected. The smaller hotels and eating-houses, however, depend largely on the bakers; and, as for the wage-earner, the five and ten-cent loaf is an established feature in his domestic economy. The strike has grown out of three demands made by the workers in the bakeries—an increase in wages, the union shop, and the use of the union label on every loaf of bread. It was not very long ago that the master bakers were trembling for their profits on account of the high price of flour; and now comes a demand for higher wages. In fighting for the open shop, they have lined up with a general movement in that direction. As for the union label on bread, the multitudes who find it harder to get bread on account of the strike may find the label edible.

"Divested of all claptrap," said President Mellen before an audience of railroad employees last week, "the union is simply a means of averaging wages, and an employer views it as such. It is a device for making those who are willing to work care for those who want to soldier." It is very seldom that so much truth is spoken before such a gathering, and as a clear-sighted advocate of individualism the President of the New York, New Haven and Hartford Railway must take his place beside the President of Harvard University. Mr. Mellen pointed out inexorably but with admirable sympathy the levelling tendencies of unionism. It discourages workmen of ability from doing their best, because all are classified arbitrarily as equals. It reduces the incentives to ambition. Practically, employers find it difficult to get men fit to take positions of responsibility. Every year the line is more sharply drawn by labor itself between the rank and file and the officers of labor. Meanwhile, the organizing of the unions has potently aided the consolidation of small employers into Trusts. All these criticisms of present tendencies and results of unionism were presented with absolute fearlessness and defended with cogent argument.

It is not surprising, then, that President Mellen was cheered the louder the harder he hit the pet ideas of his hearers. Workmen have so much cant talked to them and written at them that they preserve their relish for hearing plain truth unimpaired by too frequent exercise. It is surprising, however, that, in spite of his keen analysis of the defects of unionism, President Mellen still declared that he was in favor of the unions, and was willing that his own employees should seek their membership. This part of a notable address had an ominous sound when the men who joined were urged to attend the meetings and exercise control—as voters are urged to attend primaries; for the inevitable development of all organizations in this country is along political lines. The boss is as natural in trade unions as in party combinations. However, Mr. Mellen saw in the unions a fortunate means of promoting a better understanding between classes. In unionism, labor, he held, is creating a collective self, which may learn to be as amenable to good counsel as it is courageous in asserting its prerogatives. With the waning of small industries, such a body, with its leaders and spokesmen, becomes necessary if employers and employed are to come to any sort of understanding. Properly considered, then, he felt that the unions would make for social peace, and that, on the whole, capital and labor might gain more by observing reciprocally a humane diplomacy than capital would lose in partial sacrifice of control, or the individual laborer in submitting to the limitations of his class.

Once more President Eliot has spoken a man's word on the labor problem, scorning the humanitarian cant of the day, and considering the real ends which the unions must hold in view or disappear in the limbo of the ineffectual. The industrial conditions of public happiness, President Eliot told his students, are liberty for the individual citizen, the hope of improving his lot, stability of employment, and good will towards his fellow-citizens. The speaker assumed that the purpose of all combinations of laborers is, or should be, to increase the happiness of the individual workman's lot. Considered practically in this light, he found that the labor union substituted the tyranny of the organization for liberty, the law of rigid averages for the hope of individual progress, the strike for stability of employment, the boycott or overt violence for industrial good will. Here certainly is unionism judged severely, according to its works, but not unjustly.

With characteristic unselfishness, Senator Lodge has taken upon himself the task of writing the Republican platform. The President, as an ex-author, will be allowed humbly to collaborate. His part, apparently, is to be that of literary reviser, and he is already sharpening his blue pencil to cut down Lodge's periods, for the executive order has gone forth that the platform must have, as the bishop said of the young preacher's sermon, at least the merit of brevity. "Incisive, decisive, precise, and concise," is the command from the White House. But it is safe to say that one plank, at any rate, cannot be made of quarter-inch stuff. How can the ambiguities, the insincerities, the evasions of the position of the Republican party as respects the tariff possibly be condensed into a jewel five words long? One of the things which the Republicans will have to do much wriggling about is the proved practice of highly protected manufacturers of selling to foreigners at much lower prices than to their fellow-citizens. This was the sub-

ject of an effective speech by Senator Bacon some days ago, which threw the Republican side into much confusion. It is not simply a case of the indiscreet boasting of Mr. Schwab over his ability to sell steel rails at $16 a ton, and at a profit, though the tariff helps him to fix the price at $28. Mr. Bacon read a letter from a railway manager detailing an actual sale. His road, the Macon, Dublin and Savannah, had to pay $29 a ton for steel rails to the same company that was selling them at $20 for shipment to Honduras.

"Allowing a liberal amount for cost of delivery at tide water, which in this particular case would have been very small, we American citizens paid to this American industry $33,000 in excess of what foreigners would have been compelled to pay. And $33,000 would have put up a very handsome library filled with standard books on protection."

Mr. Cord Meyer's accession to the chairmanship of the State Democratic Committee seems to be a sort of notification that Hill is not to dominate Judge Parker, nor even the management of the party in this State. Mr. Meyer is so distinctly not a Hill man that it is impossible to conceive of him as ever being a Hill man. He is simply not in that class. His acceptance of the Chairmanship is a guarantee that, in New York at least, the Democratic campaign will not be knee-deep in peanut shells. With so clean and able a Democrat at the head, Republicans will have more reason than ever to lament the blunder through which their own party labors under the odium of a Governor abdicating to make a Chairman. Mr. Odell was evidently preparing to raise the cry of Hillism. For that matter, Odellism is rapidly coming to mean something almost as offensive; but with Hill overridden at the very start in the choice of Mr. Meyer, that appeal to prejudice seems in the way to lose much of its force. It is a pity, of course, that Democratic virtue was not equal to the task of supplanting McCarren on the executive committee. No one questions his skill or energy; but his name is too unhappily identified with the kind of politics which it can only hurt his party to have made prominent in his person.

Uncle Sam's wards are giving him a good deal of trouble. Try his best, he cannot "stand pat" with them all. He is the legally appointed guardian of the Republic of Cuba. He fought and bled for that distracted people, and has justly regarded himself as *in loco parentis* to them: the Platt amendment is a constant reminder of that fact. But Cuba has just placed her benevolent guardian in a tight place. She wanted 5,000 Krag rifles for her Rural Guard, and it was instinctive to suppose that Uncle Sam would get them for her at bottom prices. Indeed, he seemed glad of the chance, and proposed to let her buy them of his own army at $14 each. But just at this point his own blood relations stepped up and asserted that they had some rights in the case. Did he suppose that the gunmakers of this country would stand any such nonsense as that? They are here to sell rifles, and he is here to help them all he can. The idea of an old gentleman trying to steal business away from his own children is truly abhorrent. Uncle Sam, though brave as a lion in most instances, has no backbone in a matter of this sort. The result is, Cuba will not get her 5,000 rifles from our army at $14 apiece, but the private manufacturers of this country will furnish her with a prime article—at a higher price. Our War Department is duly penitent, and will be more careful the next time.

As the Kaiser recrossed the Alps, President Loubet was adding Neapolitan plaudits to the splendid reception he enjoyed at Rome. Certain comparisons between the French and the German guest are inevitable. The Kaiser has made rather ineffectual efforts to arrest the decay of an alliance; President Loubet is hailed as the representative of a friendship already firm and growing. Unquestionably, President Loubet is genuinely sympathetic to the Italian masses. On the one hand they hear of his personal simplicity, on the other they acknowledge the bond that unites two countries living under similar laws and confronted with common social problems. These considerations must be vivid to the Emperor as he reviews his attempt to combine with an outing a rehabilitation of the Triple Alliance.

Many and great are the benefits which war confers on industry. Some persons suppose that the world cannot possess too much wealth for its own good; but it is easy to puncture that error. Every once in a while it is necessary to destroy a great deal of wealth in order that there may be a chance to create some more to take its place. In this way a demand is occasioned for labor and materials, and business booms—for a time. Among those who are going to benefit from the war in the Far East are the beet-sugar growers of Europe. The outlook for their business has not been promising of late, and it will take a long time to adjust it fully to the abolition of the sugar bounties by the Brussels Convention. The German refiners are satisfied that nothing but a good-sized reduction in acreage all over Europe will bring the business back to a paying basis, yet there are no signs that the beet growers of Germany intend to adopt this policy. But what they will not do for themselves, the Far Eastern war will do for them. Russia proposes rigidly to enforce the police regulations along her Prussian frontier. This means that the 300,000 Poles who flock for work into the German beet fields every spring will, for the most part, stay at home this year. How fine this will be for the German laborers, whose wage scale will go up in a lively fashion! But a higher labor cost and a positive lack of hands will compel the growers to reduce their acreage. Let no one deplore the hardship to the 300,000 Poles. Perhaps they will be sent to Mantchuria to fight for the Czar, and thus earn money enough to pay heavy war taxes to the Finance Minister.

Russophile critics at Paris have warned us in advance against mistaking voluntary retrograde movements for Russian defeats, and yet it will be difficult to minimize the moral and strategic advantage the Japanese get by setting foot in Mantchuria. The facts of the three days' battle speak for themselves. Throwing pontoon bridges across the Yalu near Wiju, while fording at a point higher up, the Japanese advanced under cover of a crushing artillery fire. Successive defences of the Russians were reduced by the Japanese batteries, until finally Gen. Kuroki held a line four miles long, and drove the Russians back towards their headquarters at Feng-Wang-Cheng. The losses are considerable, even for an engagement of this magnitude and duration. The Russians, who were not in great force about Antung, resisted stubbornly a force about five times their own. Skilful handling of the artillery played the larger part in the Japanese success. Nothing is clearer than that the Japanese batteries outclassed the Russians in weight, numbers, and handling; Russian dispatches admit "overwhelming superiority" in this regard. Twenty-eight guns abandoned in the trenches show very plainly that the Russian batteries were insufficiently supported by infantry, and that the retreat must have lacked something of the "good order" reported to the Russian General Staff. There was no sound strategic reason for falling back from the Yalu except inability to hold that line. As a matter of fact, the Russian main force at Feng-Wang-Cheng is far from being in an easy position. It may be cut off from the Liao peninsula by a flanking movement from Taku-Shan at the south, and it even runs some risk of being taken in the rear by a descent from New-Chwang. Either landing operation would be of great difficulty, but it would be hardly more of an exploit to land under the fire of a squadron than to bridge the Yalu in the face of entrenched batteries. In fact, as we go to press, there are rumors of the fall of New-Chwang, simultaneously with a naval diversion against Port Arthur with bombs and fireships. But they are unconfirmed and are inherently improbable.

THE SESSION.

The second session of the Fifty-eighth Congress came to a close on Thursday at a date without precedent in recent years. As a rule, it has been considered extraordinary if Congress could adjourn in a Presidential year by the time of the National Conventions; but here we have the whole thing over, two months before the first of them. This will doubtless long stand as "the record." Whether it will be thought in the future even desirable to imitate the example will depend largely, we imagine, on the apparent result this year. If the effect on the Administration's fortunes seems to be favorable, other Presidents will doubtless display an anxiety equal to that of Mr. Roosevelt to get Congress "off his hands" early.

On general principles, there is no reason to regret that the session was unusually short. Too much legislation rather than too little is our curse. Overgoverning is one of the vices of our day, almost as bad as the over-tutoring that seems to go with it, intolerable as the latter is, according to Matthew Arnold. A longer session this year would have meant chiefly longer beating of the air with campaign speeches. The paralysis of "Presidential year" was more than usually severe upon Congress, this time. All was pose for political effect; and if two months more in session would have meant only two months more of posing, it is just as well that the theatre was closed and the actors dismissed.

Beyond the routine bills of supply, Congress has little to point to as the fruit of its five months' activity. A barren record, however, may be a really useful record if it involves the death of bad bills. But this Congress has simply left the bad bills in a state of suspended animation. Everything was put over till December—the anti-injunction bill, the eight-hour bill, the Philippine railway-guarantee bill, the bill for the protection of the President, the subsidy bill, and one does not know how many more. Afraid either to pass or defeat them, Congress resorted to delay. Of course, the delay means defeat for any measure stoutly opposed. The session beginning in December will expire by limitation on March 4, and the appropriation bills can easily be made to crowd obnoxious measures off the track. Hence a postponement to December is generally tantamount to postponement to the Greek Kalends.

Turning from the beggarly account of work done, to the tendencies and personalities conspicuous in the session, we have to ask, first, how stands the case of the House against the Senate? Speaker Cannon, we were told, was to reassert the ancient privileges and restore the traditional prestige of the Representatives as against the Senators. How has he fared? Something has undoubtedly been accomplished. At the extra session, the Speaker stood like a rock against the Senate's plan of adjournment. This ruffled the feelings of godlike Senators, and drove President Roosevelt to the metaphysics of his "constructive recess." Score one for the House. But in the subsequent encounters its advantage has not been so evident. To figure out a slight percentage more of items in appropriation bills "conceded" by the Senate than by the House, is not the heroic thing we were promised. That is not to vindicate the absolute control of the power of the purse by the lower chamber. In practice, what we feared has too often turned out to be the case. Senators, among their other possessions, own a certain number of Representatives. The latter cannot, therefore, be expected to say to their political creator, "What doest thou?" In order really to cut down the overweening power of the Senate, and to rein in its arrogant pretensions, something must be done to strike at the hidden and, often, the abhorrent means of aggrandizement upon which Senators grow great. We are unable to see that any progress in that direction has been made.

Personality, however, makes up the main charm of politics, as of everything else, and it is in the personal aspect that the session is most memorable. We have had a partial revival of parliamentary oratory, and we have seen a successful parliamentary leader emerge. The great impression produced by Mr. Cockran's speeches shows how eager the House still is to listen to a heaven-born orator, even if his resounding eloquence prove often only the sound of a mighty rushing wind. But it is the appearance and triumph of Mr. Williams of Mississippi as the leader of the minority which really makes the session notable. A man unknown before except to his colleagues, he has made himself at once a national figure. This he has done by his tact, his alertness, his good nature, his wit, his keen eye for an opening, his perception when to be silent as well as when to speak, and by the resources of a trained and well-stored mind. It is a case where education is justified of her children, for Mr. Williams had an unusual university career, in this country and in Germany. His grasp of economic and political principle is firm, and he has the happiest faculty for pointing the truth by some homely illustration. His neat puncturing of the balance-of-trade humbug, for example, was inimitable. Of course, he has shone partly by contrast with his Republican antagonists. Payne, Grosvenor, and Dalzell, as the Republican paladins, show upon what an evil day their party has fallen in the House. But Representative Williams is a man whose qualities would command respect under any conditions. He has made his party in the House a unit, and restored it as a watchful, aggressive, and hopeful Opposition. To have done that is a great distinction; and in Mr. Williams's rise to prominence we see fresh reason to believe in the undeveloped and inexhaustible political resources of our country.

ROOSEVELT AND GROSVENOR.

President Roosevelt may well pray to be delivered from his friends—especially from Representative Grosvenor. A few days ago Mr. Kitchin of North Carolina made in the House a speech in which he showed what President Roosevelt thought of Grosvenor and what Grosvenor thought of Roosevelt. The full report of these speeches, since issued in the *Congressional Record*, is even more instructing and entertaining than the brief press abstracts.

Mr. Kitchin called attention to a passage in 'American Ideals,' in which Roosevelt, the civil-service reformer, writes Grosvenor down as one of the "champions of foul government and dishonest politics," who "fight [against the reform] with the vindictiveness natural to men who see a chance of striking at the institution which has baffled their ferocious greed." "These men," added Roosevelt, "have a gift at office-mongering, just as other men have a peculiar knack of picking other people's pockets."

Some persons would have been pained by such a flaying, but not Grosvenor. His hide is the toughest in Congress—or his heart the most forgiving. He admits that he had "a sharp contention" with Roosevelt; but, he protests, "I had stood firmly then where I stand now." He "did not believe that the machinery of this Civil Service Commission was a proper adjunct to the administration of a great Government," and he has "never changed" his mind. His patriotic course was dictated merely by a desire to "protest against the absorption of the political power of this country by the Civil Service Commission." So much for the whiteness of Grosvenor's soul and the purity of his motives. But, singularly enough, Roosevelt's attitude was equally correct. The fastidious Grosvenor would have thought "vastly less of the President if he had not in those days of contention used strong language in denouncing the men" who voted "to strike out the pay of the Civil Service Commission." This strong language so endeared Roosevelt to Grosvenor that the Congressman frankly admits: "He wrote of me what he had the right to write. He wrote of me that I was one of the active and strong opponents of the doctrine, and he used language that was by no means unfitted for the occasion from the standpoint that he believed at the time." In licking the hand that strikes, Grosvenor has

no equal. Were all of us so filled with Christian charity, the way to bind men to you in friendship stronger than hooks of steel would be to denounce them as corrupt and dishonest, little better than pickpockets.

In explaining his own attack on Roosevelt in 1900 Grosvenor is even more ingenuous. During the Philadelphia Convention, Grosvenor served as a special correspondent of the New York *Journal*, an "enterprising newspaper," whose editor, though naturally admired by Grosvenor, is now "being hounded." Mr. Grosvenor had complained that a certain Theodore Roosevelt, "a brilliant, erratic, curious sort of a man," was being used by "a great herd of selfish politicians" "for their own selfish and shameful ends." On such a topic Grosvenor could speak with authority. He therefore proceeded to tell how these politicians were trying to "dump" Roosevelt upon the Presidential ticket in the "sole and sordid interests of themselves and their own schemes of politics." These plotters were striving to force upon McKinley "a distasteful running-mate." But Grosvenor explains that he merely wrote "the popular opinion" of Roosevelt; that he had never "associated intimately in public life" with Roosevelt—a deprivation which he regards as a "misfortune." Moreover, Mr. Grosvenor does not remember saying that Roosevelt was distasteful; at any rate, he himself cheerfully swallowed the dose.

Having thus buried the dead past, the Ohio apologist began his eulogy of the Roosevelt of to-day. He assured his listeners that the promise to carry out the McKinley policy had "saved the loss to the people of this country in money alone of hundreds of millions of dollars." The trouble, so the defender of Roosevelt asserts, was that "it was *natural to fear*, and we all did fear, that there would be a panic in Wall Street," an "immeasurable stampede of destruction." But this general dread of Mr. Roosevelt vanished when his voice "stilled the rising tide as the voice that on the lake spoke the words, 'Peace, be still,' and allayed the storm."

Not content with this back-handed compliment to the President, Grosvenor proceeded: "I have never known a public man holding a high position that was more amenable to the sentiment of public declarations and the advice of his party and those surrounding him." On the inflexible Roosevelt, always courageous in clinging to his convictions, Grosvenor throws this further light: "I could go into details, showing where he here changed his policy upon a certain thing, and there changed his declarations in his message, and here did this to accommodate the opinion of men surrounding him." From "personal acquaintance" with both men Grosvenor avers: "There has been less of determined purpose to carry out his own personal views in public affairs than there was with Mr. McKinley."

It is no marvel, then, that Grosvenor concludes: "I speak with no extravagance when I say that his judgment upon the great public questions of the day has been unerring." Such is the tribute from the great and good Grosvenor to "the stone which the builders tried to reject," but which "has become the head of the Republican corner." No one is disposed to take Grosvenor's utterances very seriously—least of all ourselves. Nothing he can say will alter the general estimate of his own character; but the inevitable inference from his words corroborates his explicit statement that "four years have developed this man" Roosevelt; and that they have developed him, not in his early ideals, but in the "practical" side of politics, to which Grosvenor is so ardently devoted.

TRADING WITH CANADA.

Senator Lodge will shortly be informing the people of Massachusetts that he disapproves of them. Three weeks ago he went on from Washington to tell the State Convention not to touch that unclean thing, Canadian reciprocity. Yet the Committee on Federal Relations in the Massachusetts Legislature promptly had before it a memorial to Congress for a trade treaty with Canada, and, still more rebellious, the Boston Chamber of Commerce received a petition signed by over 35,000 business men of the State, asking it to undertake an agitation in favor of the wicked policy. The people are thus selfishly placing their own interests before those of the party. The "American idea" is nothing to them; the "Massachusetts idea" everything.

The mischief of it is that the manufacturers of Massachusetts perceive that they must buy as well as sell. In particular, they desire Canadian coal, asserting that if they can get that they can keep their mills and factories from drifting to other parts of the United States. Lodge does not care how much New England sells to Canada, but he sees nothing but ruin in purchasing from that quarter. Another Massachusetts man, Secretary Moody, once summed up the "American idea" in a sentence. The balance of trade with Canada, he said, is constantly in our favor, "and it would seem as if we had no ground for complaint." Certainly on this score we have no fault to find; for, since the Dingley law was passed, the excess in our favor has mounted from less than $25,000,000 annually to about $68,500,000. In other words, our exports to Canada have increased from $64,928,921 in 1897 to $123,266,788 in 1903, and our imports from $40,309,371 to $54,781,418. But nobody knows how much the relation of exports to imports has been affected by causes in no way concerned with the tariff. For instance, the investment of large amounts of American capital in manufacturing and trade in Canada during the last six or seven years has probably had a great deal to do with creating a new demand for goods made on this side of the line.

Trade between this country and Canada is bound in the main to follow natural lines, tariff or no tariff. The freight rate has much to do with determining the market in which any article shall be sold. That factor would prevent really competing Canadian products from penetrating this country very far, in any event. Where they do go far beyond the frontier, it is because we must have them. In that case the tariff means only a needless expense. Unfortunately, the Cape Breton coal mines are too far from Boston to allow their product to be bought freely despite the tariff. And, reversing the case, Toronto, Hamilton, London, and other Middle Canada cities are too far from the coal deposits of our Middle States to admit of their buying as much as their real industrial development calls for. From New Brunswick practically to the Rocky Mountains the veins are on this side of the line, and that part of the Dominion is largely dependent upon us. On the Pacific slope the situation is, however, reversed; British Columbia has most of the coal, and our extreme Northwestern States would be greatly benefited by free access to it.

Despite all the artificial barriers that have been erected, commodities of similar classes pass to and fro. During the nine months ending last March we imported 1,046,388 tons of coal from Canada, and exported 4,510,836 tons; 15,458,313 pounds of refined copper were imported, and 2,287,796 pounds exported. From Canada we received 3,704,355 pounds of refined sugar, and sent her 1,882,082 pounds in return. She exported to us $6,425,481 of boards and sawed lumber, but we managed to sell her $2,397,862. These are all comparatively small items, but they show that it is give and take between the two countries, even on competing articles, when the transportation charges are right. In some localities goods can be imported into the United States because the transportation cost, plus the tariff duty, is less than the cost of bringing similar commodities from more remote American centres. The same is true on the other side of the line. Sometimes it is nip and tuck, as in British Columbia, where American and Canadian flour has in the past sold in nearly equal quantities, the duty and railroad freight about offsetting each other.

We do our best to keep Canadian goods out of this country, but we are rushing our people and our money over the line in lively fashion. Last year thirty thousand Americans, with their families, settled in Canada, chiefly as farmers. In

the last few years a vast amount of our capital has been placed in all sorts of industrial enterprises in the Dominion. Thus both farmers and capitalists, if we may believe the protectionists, have been at work to ruin the country that nurtured them. Even now their products are knocking for admission into the United States. The danger is lest this in time corrupt those of us who have stayed at home. We shall soon forget that a bushel of Manitoba wheat will not create as much American manhood in the consumer as a bushel of Minnesota wheat.

ALDRICH ON SMALL CHANGE.

Senator Aldrich led a successful retreat from an untenable position just before the adjournment of Congress. The Committee on Appropriations, apparently at his instance, had proposed, and the Senate had adopted, an amendment to the Sundry Civil bill removing all limitations upon the subsidiary silver coinage. This amendment had met objections in the conference committee, which caused the Senate members to recede from it. In submitting the report from the conference, Senator Allison gave the *pas* to Senator Aldrich to make explanations to the Senate on this point. The latter said that, *after* the Senate had agreed to the amendment, the Committees on Finance and Appropriations had very carefully gone over the subject and had come to the unanimous opinion that this amendment, or its equivalent, had been adopted in the Sundry Civil bill of last year, and hence was superfluous, and for that reason should be withdrawn.

A carping critic might say that committees of the Senate are appointed to "carefully go over" such matters *before* the Senate takes action on them. In this instance there was a further reason for following that mode of procedure, since the Senator, in his remarks, quoted from a letter addressed to him by the Secretary of the Treasury a little earlier, calling his attention to the clause in the Sundry Civil bill of last year. In this letter the Secretary expressed the opinion that it did not remove the limitations on the subsidiary silver coinage in general, but only on that which might be produced from bullion purchased under the Sherman act of 1890.

Mr. Aldrich assured his fellow-Senators that the last year's enactment removed all limitations, and, in order to prove his contention, he would have the clause in question appended to his remarks and printed in the *Record*, together with the previous law to which it referred. Then, with some sarcastic remarks on certain "hysterical" persons, "not members of this body," he was glad to say, but presumably of the other body, he handed in the extracts from the two laws which he relied on to justify his retreat.

The clause of last year's bill says that "the authority given to the Secretary of the Treasury to coin subsidiary silver coin by the 8th section of an act . . . approved March 14, 1900, may hereafter be exercised without limitation as to the amount of such subsidiary coin outstanding." Reference to the 8th section of the act of 1900 shows that the authority given was solely "to use any silver bullion in the Treasury of the United States purchased under the act of July 14, 1890 [the Sherman act] for coinage into such denominations of subsidiary silver coin as may be necessary to meet the public requirements for such coin; provided that the amount of subsidiary silver coin outstanding shall not at any time exceed in the aggregate $100,000,000." Thus the authority given by the act of 1900 was to coin a particular lot of bullion within a specified limit as to amount. The authority given by the act of 1903 was to coin the same lot of bullion without any limitation of amount. The Secretary of the Treasury so understands it, and the Director of the Mint agrees with him, and Senator Aldrich must have agreed with their interpretation until last Wednesday. It is not likely that these responsible officers will accept Mr. Aldrich's revised opinion in place of their own in a matter involving the policy of the Government in dealing with the silver question. It would be very risky for them to do so, for even if they were inclined to take such shelter, there is no knowing how soon the Senator from Rhode Island may change his opinion again.

The plain English of the matter is, that the Secretary and the Director and a majority of the House desire to recoin the silver dollars in the Treasury into subsidiary coins as fast as the growth of population and of retail trade shall call for more small change. The annual increment is now at the average rate of $5,500,000 per year. No revolution in the currency can take place by reason of this, but a slow replacement will be effected, the cart-wheel dollars reappearing in the circulation as halves, quarters, and dimes, and gold flowing in to take the place of them. Gold has been flowing into the circulation since 1900 at the rate of $66,000,000 net per year in the form of certificates alone. According to the calculations of the Director of the Mint, gold has been, and still is, finding lodgment among us at the rate of $90,000,000 or more per year, in all forms—a fact which ought to steady the nerves of any who may be troubled about the Panama Canal payments. At all events, nobody can imagine that there will be any shortage of legal-tender money consequent upon the recoinage of the old Bland dollars into halves, quarters, and dimes as fast as there is a demand for them. Two years ago the House passed a bill for such recoinage, but the Senate Committee on Finance killed it. There was, perhaps, no need of additional subsidiary coins at that time, but there is such a need now, or soon will be. Under existing law, whenever the limitation of $100,000,000 on such coinage is removed, additional silver bullion must be purchased for any increment. That is what Mr. Aldrich favors, but does not, up to the present time, avow. That is what Secretary Shaw, Director Roberts, and the "hysterical" members of the House are opposed to. They desire to save some of the money that the Government has invested in Bland dollars (five hundred carloads of them)—to save some of it now and eventually the whole; and at the same time to purge the currency of an unwholesome element. When Senator Aldrich next explains, let him give some attention to this branch of the subject. We are sure that his constituents would like to know what he thinks about it.

THE WAR DIET IN JAPAN.

TOKIO, April 7, 1904.

The war Diet and its work rightly claim a share of current interest. They shed light on national feeling, political conditions, and financial measures—prime factors in the war problem. The extra session of the Diet was formally opened on March 20 and closed on March 30. History strikingly repeats itself. The constitutional life of Japan covers only fifteen years, yet this is the second time that the Diet has met in extraordinary session. Both Diets were hastily convoked to meet the exigencies of war. Both Diets were newly elected after two successive dissolutions. Both came back with large majorities hostile to the Ministry. Yet both war Diets zealously put aside for the time all partisan issues, and unanimously voted the means and the measures required by the Ministry for the successful conduct of the war. The hope of the enemy to find Japan weakened by internal dissensions was therefore in both cases vain. In each case the war is waged against the Colossus which for a time had seemed to dominate the Orient and to overawe the world. In each case the stated purpose of the war is—ironical as it may seem—"to establish the peace of the Orient." The first war quickly laid the seeming fierce and mighty adversary low. The second war—awaits the issue.

In a twofold sense this is a war Diet. It is a child of the war, and it has to vote the measures required by the war. The election (March 1) of the present Diet occurred under the drowning enthusiasm of the first brilliant victories of war. The last Diet, after a single day of actual life, was snuffed out of existence because, in its reply to the address from the throne, it had censured the Ministry both for its domestic and for its foreign policy. Its predecessor had, one year before (December, 1902), refused assent to the budget of this same Cabinet, and had in consequence been dissolved. These facts would, under ordinary circumstances, assure a spirited election contest. The unusual apathy which in

fact marked the election was due partly to the excitement of war, and partly to the certainty that partisan issues would be shelved during the war.

The main facts concerning representation in the present Diet are: That the Constitutional party (*Seiyu-kai*) numbers a little more, the unaffiliated members (Independents?) a little less, than one-third, and the Progressives about one-fourth of the total; that the number of the Constitutional party was much diminished, the number of unaffiliated members much increased, by the last election; that the Constitutional party and the Progressives, which have for two years coöperated in opposition to the Ministry, together have a clear majority of nearly thirty in the lower house; that nearly one-third of the present members sit in the Diet for the first time, nearly two-thirds were members of the last Diet, and only one-seventh of them sat in any previous Diet; that the representatives of urban districts make up one-fifth of the total membership.

In preliminary party conferences, both the Constitutional party and the Progressives censured the Ministry for divers shortcomings and wrongdoings—political capital created for future use; then resolved to grant all the funds and all the powers necessary for the Government to attain the object of the war. In party councils and in the Diet it was much emphasized that the naval victories and foreign sympathy were won by Japan because of her constitutional and enlightened government, and that the nation must therefore continue to march in the ranks with the other progressive peoples. The main work of the Diet was to vote supplies for the war. In the budget estimates of the Government the war expenditures for the year, including a contingent fund of forty million yen, were put at five hundred and seventy-six million yen. It was proposed to raise this sum thus:

From increased taxation	68,000,000
From surplus revenues	47,000,000
From Treasury bonds	31,000,000
From funds taken, or to be taken, from special accounts	50,000,000
From loans (including 100 millions issued)	380,000,000
Total	576,000,000

Treasury bonds must ultimately be paid and the funds taken from special accounts be restored. Hence the aggregate loans are to be (31+50+380) four hundred and sixty-one million yen. At 5 per cent., the yearly interest on this sum would be slightly over twenty-three millions. Supposing the forty-seven million of "surplus revenues" to be only a temporary asset, the sixty-eight million of additional taxes would pay the interest and cancel the debt in a little over ten years.

The Government proposed to obtain the additional taxes in four ways: (1) by raising the rate of some dozen classes of taxes, chiefly land, business and income, sugar, soy, kerosene, and stamp duties; (2) by increasing certain import duties, chiefly on tobacco, kerosene, and some textiles; (3) by imposing new (15 per cent.) taxes on silk goods and woollen goods; (4) by creating a state monopoly of the salt manufacture and the tobacco manufacture. The Diet rejected the tax on silk goods and the salt monopoly. It reduced the rate on agricultural lands from 4½ per cent. to 4 3-10 per cent., and increased the sums to be obtained from the tobacco monopoly, the sugar tax, and the import duties. The net result of changes thus effected was a deficit of 6,171,561 yen, which the Government agreed to cover by raising the price of tobacco, effecting economies, and drawing on the capital funds.

The increase of land-tax burdens is greater in appearance than in fact. About one-third of the total increased yield of taxation is to come from the land tax, of which the rate is raised nominally thus:

	Increase p. c.
On urban building lands, from 2½ per cent. to 8 per cent.	5.5
On rural building lands, from 2½ per cent. to 6 per cent.	3.5
On other lands, from 2½ per cent. to 4.3 per cent.	1.8

The weight of the seeming increase is vastly lessened by two facts. (1.) The tax is assessed, not on the real value of the land, but on a nominal (cadastral or "legal") value, which is usually much less than the real value—in the case of building lands often absurdly small. (2.) The nominal increase of the land tax represents increase, not over rates which land owners have been paying, but over rates which they had paid before 1899. The rates of the land tax had been raised for the five years 1899-1903, inclusive, to very near the new nominal rates. Thus, the tax paid on "other (agricultural) lands" till the beginning of the current year was 4 per cent., instead of 4 3-10 per cent., as now imposed. The actual increase in this tax is therefore only three-tenths of 1 per cent. Furthermore, the cadastral nature of the land tax makes its yield accurately calculable in advance.

Next in importance to the land tax is the estimated yield (about 13 per cent. of the increase) of the business and income taxes. These are raised by an amount equal to 70 per cent. of the existing (national) rates. (The business tax is assessed on a very complicated basis.) The personal income tax (national) is graded from 1 per cent. on incomes of 300 yen, reaching 1½ per cent. on 1,000 yen, 2 per cent. on 3,000, 2½ per cent. on 5,000, 3 per cent. on 10,000, 4 per cent. on 20,000, 5 per cent. on 50,000, 5½ per cent. on 100,000 yen or more. A supplementary tax of one-half the above rates is added for local purposes (but not on the recent increase). The total increased rates (including supplement for local purposes) of the income tax will therefore range from 2 1-5 per cent. on incomes of 300 yen to 5½ per cent. on 5,000, and 12 1-10 per cent. on 100,000 yen or more. The income tax for "legal persons" is uniform at 2½ per cent., subject to the supplementary local rates and the 70 per cent. increase. Incomes derived from interest on public or corporation bonds are uniformly taxed 2 per cent., and are not subject to the recent increase—a provision doubtless intended to favor both Government credit and joint-stock enterprises. Moderate personal incomes are subject to rates similar to those attained in England during the South African war. But on both larger and smaller incomes nominal rates in Japan are much heavier than in England.

The sugar tax is expected to yield another 13 per cent. of the increase. Here again the rates are heavy—2, 4.60, 5.50, and 6.50 yen per picul (133 pounds) respectively on the four grades of sugar. But sugar is regarded in Japan as a luxury. If it is in fact a luxury, the crucial question will be whether sufficient allowance has been made for shrinkage of demand at higher prices.

The tobacco monopoly is not wholly an experiment. Since 1898 the Government has maintained a monopoly of raw (leaf) tobacco. It is now proposed to include the tobacco manufacture and trade. The plan to do this had been urged for several years. It met with little opposition in the recent session of the Diet. The amount of compensation to be given to existing tobacco manufacturers and the method of distributing the grant among them caused much discussion. The Government proposed to give to the manufacturers (in the form of 5 per cent. seven-year bonds) a bonus equal to three years' profits calculated and distributed according to the amount of business taxes paid by them. But the Diet substituted the principle of giving to each manufacturer a lump sum equal to 20 per cent. of his gross sales for one year. According to the Government plan, some manufacturers would have obtained only 18 per cent. of their gross sales for one year, while the largest company would have received 54 per cent. on its gross sales for one year, amounting to more than one-half of the total sum paid by the Government. Hence the action has created much discontent and sharp criticism.

Two other actions of the Diet are widely regarded as inexpedient: (1.) On behalf of the Treasury, the Industrial Bank was authorized to issue, within the limit of thirty million yearly, and at 4 per cent. maximum interest, premium-bearing bonds of five yen denomination. The theory is that these bonds will be extensively bought by members of the laboring classes, and cause a large part of the funds paid out by the Government to return to it. On the urgent request of the Prime Minister the bill was passed as a temporary war measure. (2.) The Diet insisted that the laws for increasing taxes should cease to operate within the calendar year following the end of the war. As the political parties have only made a truce with the Ministry, they clearly propose to hold fast to all points of vantage from which in future to attack the Government. This simply reveals the struggle of the lower house to make the Ministry responsible to itself—a struggle which is the key to recent Japanese politics; not necessarily an organic weakness of the political system, but rather a natural and necessary phase of the present stage of Japanese constitutional progress. It is none the less unfortunate, because for the time being it impairs the credit of the Government. But, in the opinion of the national press, all shortcomings of the Diet were atoned for by a resolution which stated that the Emperor had declared war in order to secure permanent peace in the Far East, and that the Diet had voted and, however remote the end of the war, would vote abundant supplies to attain that end. The *Jiji Shimpo*, which deplored a few acts of the Diet, concludes its leader on the work of the Diet thus: "But what country is there whose parliamentary history is without its dark pages, especially during its early period? Japan is yet young under her constitutional régime, and a few blemishes may well be overlooked, so long as the Diet is proving on the whole an indispensable body for national development." This is eminently just; for, after all, the main fact stands out that, as far

as the war is concerned, the Diet revealed a unified and resolute nation, while its work amply meets all war requirements.

E. H. VICKERS.

GREEK SITES IN THE ÆGEAN AND ASIA MINOR.

ATHENS, April 15, 1904.

A tour among the islands of the Ægean and along the coast of Asia Minor is a constant delight to the lover of beautiful scenery, and offers much that is of interest to the geologist and the naturalist. But its chief interest, even for those who are not archæologists by profession, is historical and archæological. Traces of ancient occupation are visible almost everywhere, and in recent years excavations have been carried on at many of the more important sites. At most places the excavations of the present season are only just beginning; but the results of last year's work and the work of previous seasons are not in every instance generally known.

Excavations were begun at Delos by the French School at Athens in 1873, and were carried on more or less energetically from 1877 to 1894. Last year they were taken up again, and a fund of 50,000 francs is available for further work. In the earlier days of the work the earth and débris were not thrown into the sea or otherwise removed, but each part of the site excavated was covered by the material from other parts. As a result, the field of excavation presented a very confusing and unattractive appearance. Now the removal of the earth, etc., has been begun. The court to the east of the "portico of Philip" is completely cleared, and that and the neighboring parts of the site are in good order. But much still remains to be done before the entire excavated field can present an orderly appearance. The site is an exceptionally interesting one on account of the importance of Delos at various periods. As yet the most imposing ruins belong to Hellenistic and Roman times, for but little remains of the temple of Apollo and other earlier structures. Some of the houses of Roman times are interesting, and retain their mosaic pavements and even parts of their painted decoration. The entire site, when completely cleared, will no doubt be one of the most interesting in Greece, in spite of the fact that most of the remains still to be found will probably prove to be of comparatively late date. Already the excavated area, with the remains of the theatre, of temples, porticos, market place, treasuries, storehouses, and dwellings, is one of the largest in Greece, and as yet only a comparatively small part of the site has been laid bare. The portable objects found at Delos are, with some exceptions, kept at the village of Mykonos, on the island of the same name. Among them is an interesting series of archaic draped female figures found near the temple of Artemis. They resemble very closely the figures found on the Acropolis at Athens. But perhaps the most interesting things at Mykonos are the vases found at Rheneia. A great number of these show the style which has until recently been called Melian. The curator of antiquities at Mykonos, Dr. Stavropoulos, has put these vases together out of many fragments with the greatest skill and patience. Other vases found in surroundings which fix their date just before 425 B. C. show the decadence of the red-figured style at that time.

At Melos the site of the Hellenic town offers little of interest, though the Roman theatre is worth a visit. Nothing marks the spot where the famous Aphrodite in the Louvre was found. The most interesting site on the island is at present Phylakopi, some five or six miles from the harbor. Here the British School at Athens has excavated three settlements, one above the other, the latest of which belongs to Mycenæan times. The three strata are clearly to be seen. The place can never have been a great city, but must have been of considerable importance when its chief export, obsidian, was in great demand. The results of the excavations have just been published as a supplementary paper of the Society for the Promotion of Hellenic Studies. They are of especial importance on account of the light thrown upon early Ægean art and civilization.

The island of Thera, or Santorin, is well worth a visit on account of its remarkable harbor, even if there were nothing of interest to be seen after landing. The harbor is the immense crater of an extinct volcano, and is almost surrounded by nearly vertical cliffs, while in the middle of it are three small islands forming a smaller and later crater, which still shows signs of activity. Here the water is always warm and much discolored, and smoke and steam often rise into the air. Vessels frequently lie for a night beside these little islands, that the hot and sulphurous water may cleanse them of barnacles. The town of Thera, or Phira, one of the largest of the clean white towns of the Ægean Archipelago, is perched high on the cliffs above the harbor. It has a well-built and convenient little museum, in which are exhibited the objects of interest found on the island. Until recently Thera was familiar to archæologists mainly on account of the peculiar "pre-Mycenæan" vases found there, the chief specimens of which are at the École Française at Athens, though some are in the museum at Thira. In recent years, however, Baron F. Hiller v. Gaertringen has undertaken a thorough investigation of the island and its remains of antiquity. The ancient town was built on the ridge of a steep hill, the highest point of which is some 1,200 feet above the sea that washes its base. It seems strange that any people should have chosen this wind-swept and waterless height for their city, but here have been laid bare remains of buildings and other signs of habitation extending from the eighth century B. C., or even earlier, to late Roman times. Of the walls still standing the greater part belongs to the Hellenistic and Roman periods. Few parts of Greece have been so thoroughly explored as Thera, owing to the devotion and energy of Baron Hiller and his associates, the results of whose labors will fill four large volumes, two of which have already appeared.

The ancient city of Samos was on a high hill near the modern town of Tigani. A large part of the city wall can still be traced, and on the acropolis the fine Hellenic walls of large squared blocks are in part well preserved. The ancient aqueduct, of the sixth century B. C., cut through the hill, can be followed with the aid of candles for several hundred yards. But the centre of interest is naturally the great temple of Hera, situated by the seashore some four miles from the present harbor. Excavations were carried on here in 1902 and last summer by Mr. Cavvadias, the Greek ephor-general of antiquities. He laid bare the foundations of the temple, which stand in part upon the substructure of an earlier building. The plan has one marked peculiarity: there were eight columns at the east front, but at the west, where there was no door in the middle, there were nine columns. The reason for this is probably to be found in the difficulty experienced in obtaining epistyle blocks of the great size required to span the intercolumniations. At the east end, where a door was essential, an intercolumniation at the middle was necessary, and an odd number of columns was out of the question. The great epistyle blocks had therefore to be obtained and put in place in spite of all difficulties. At the west end the addition of one column reduced the size of the blocks materially. The north and south sides had each twenty-four columns. The only column still standing was never finished, being still unfluted, but its base is Ionic, and the bases and drums of other columns are of the same style. One entire Ionic echinus and two fragments, all with large egg-and-dart moulding, are preserved, but there are no traces of volutes. Vitruvius says that Theodorus, one of the architects of the temple of Samos, wrote about the Doric temple of Hera at Samos, and Mr. Cavvadias has proposed to complete the capitals of the columns by adding a simple square Doric abacus instead of Ionic volutes. It certainly is odd that no fragments of volutes have come to light, but such a contamination of Doric and Ionic elements as Mr. Cavvadias suggests would be most remarkable in a building of the sixth century. It would be simpler to believe that the Ionic columns belong to a later rebuilding of the temple, and that the volutes have all disappeared in limekilns. At the east of the temple are remains of a propylon or similar structure, in the midst of which are the foundations of a Byzantine church. Upon these stands a small modern church. Several small shrines, apparently of late Greek or Roman times, existed close to the temple, and many fragments of richly decorated architectural members are lying about. There is evidently much work still to be done at this place, and it is to be hoped that it may be accomplished without long delay.

In Crete, which has been the scene of such remarkable discoveries, the season's work has begun. Mr. Evans is again exploring the great palace at Cnossus, and is also excavating in the neighboring necropolis, where he has already opened more than seventy tombs. The earliest of these are of Mycenæan date, of the "third-palace period," while others are of Roman times. Several interesting objects have been found, including pottery, bronze vessels, and utensils of various kinds. One Mycenæan bronze sword has a gold handle upon which are engraved lions hunting their prey. The Italian excavators are busy at Agia Triada, near Phæstus, the British School has returned to its labors at Palaikastro, and Miss Boyd is again at Gournia. In the museum at Candia the portable ob-

jects from all these and other places in Crete are now admirably exhibited. The curator, Mr. Hatzidakis, deserves the greatest credit for the promptness, energy, and care displayed in the restoration, preservation, and arrangement of the priceless treasures under his charge. It is a pity, however, that the building containing those treasures is not fireproof, and is in no way whatever protected from conflagration. The precious records of the pre-Hellenic civilization of Crete—the wall-paintings from Cnossus and Phæstus, the brilliantly painted sarcophagi and the wonderfully carved steatite vases from Agia Triada, the beautiful painted jars and other monuments of early art from various parts of the island—may all be destroyed by the dropping of a match! Probably a suitable museum building will be provided in a short time. Meanwhile, it is a great boon that the unrivalled collection of treasures is in careful and intelligent hands.

Of the Greek cities in Asia Minor, Ephesus and Miletus were in ancient times among the most important, and at these two places the Austrians and Germans respectively are carrying on thorough excavations. At Ephesus the excavations of the present season have not begun, for the greater part of the ancient city lies so low that the water makes digging impossible until the summer is more advanced. In the last few years the great theatre has been cleared, several detached monuments have been investigated, the city walls and the water works have been studied, and much of the business quarter of the city has been laid bare. Unfortunately, there is so much water in this region in March and early April that the details of some of the buildings are difficult to trace, but the broad paved way, flanked with colonnades, which led from the theatre to the harbor, the spacious agora, with its long porticos, and the buildings along the quay bear evidence to the importance and magnificence of the city in the Hellenistic and Roman times, to which most of these remains belong. Opening from the agora is a building—apparently a library or something of the sort—erected by a man named Celsus in the days of the Antonines, the decorative carving of which is exceptionally rich. Of the smaller objects found at Ephesus, the most remarkable is the bronze statue of a nude youth somewhat above life size. This was found in many pieces, but has been most skilfully restored at Vienna, where it now is. The youth is represented scraping himself with a strigil. The plausible suggestion has been made that the statue is a work of Dædalus, a grandson of the famous Polyclitus. The great temple of Artemis, partially excavated by Mr. Wood, is soon to be more completely excavated by Mr. Hogarth of the British Museum.

At Miletus the German excavators, under the direction of Dr. Wiegand, are already at work. The excavations were begun in 1900 and have entirely cleared the magnificent theatre, the town house, or bouleuterion, with its porpylæum, large enclosed court, great altar, and assembly hall, as well as several less important buildings. An interesting feature of the bouleuterion is the employment of Ionic half-columns, the capitals of which have no volutes, and are crowned with a plain square abacus. This Hellenistic structure thus shows a mixture of Doric with Ionic elements, similar to that suggested by Mr. Cavvadias for the Heræum at Samos. On the hill at the side of the theatre the remains of a peculiar circular building have been uncovered. The building was about fifty feet in diameter, and in one side of it is a rectangular vaulted chamber, about twenty by fifteen feet in size, at one end of which are five rectangular niches, with their short ends toward the entrance. These were no doubt intended to receive corpses. A large rectangular hole in the middle of the chamber, covered with a slab of stone, is explained as a receptacle for bones removed from the niches. At the sides and in front of the circular building were porticos with columns. The whole structure, which belongs to the Hellenistic period, must have been an imposing monument. The circular building must have been considerably higher than the porticos, and probably ended in a conical roof. Work is now going on at the Lion's harbor and at a large Roman bath.

The temple of Didymæan Apollo, about fifteen miles from Miletus, was one of the largest and most splendid temples of the Greek world. The building, remains of which are still standing, was begun apparently in the fourth century B. C., but the work was still going on 200 years later, and the structure was never completed. Two finished Ionic columns still support a fragment of the richly decorated architrave, and a third column, unfluted, stands at the other side of the temple. The eastern front of the temple has been laid bare by French excavators, and shows an interesting arrangement of its ten columns with rich and varied bases, disposed to correspond in pairs. The wide flight of steps leading to the entrance is flanked by projecting rectangular pedestals, evidently intended to support statues or something of the sort. At the north side parts of several columns are still in place. These are unfluted, but on one at least the position of the flutings is marked by incised lines. The ruins are situated in the midst of the village of Ieronda, some three miles from the sea, and some of the column drums at the west end of the temple are built into the walls of houses. Above the pronaos stands a windmill, which has been sold to Dr. Wiegand. It is therefore to be expected that the site will soon be excavated by the Germans, when all that remains of this magnificent temple will be made known.

Since 1900, excavations have been carried on at Pergamon by the German Archæological Institute, under the direction of Professor Dörpfeld, with the purpose of laying bare the remains of the entire city, so far as possible. Last year the great gymnasium, or rather gymnasia, on three terraces connected by stairways in vaulted passages, were excavated. The work of this season is not yet begun. Even now Pergamon is perhaps the most interesting Greek site in Asia Minor, and, with the progress of the excavations, its importance is sure to grow. The magnificent sculptures from the great altar and the other buildings on and near the top of the hill are in Berlin, but the remains of the buildings of the city cannot well be removed, and will, when completely excavated, offer, in their unrivalled natural setting, a most superb example of a great and rich ancient city.

Correspondence.

THE FRENCH SHORE QUESTION.

To the Editor of The Nation:

Sir: There is great rejoicing in our oldest colony to-day over the final settlement of this most irritating question, the most dangerous dispute, as Sir Charles Dilke declares, between England and France. For the past fourteen years our people on the treaty shore—British subjects living upon British territory—have suffered privations, annoyance, and a burden so intolerable that, were it not for the evidence contained in the report of the royal commission on the subject, the facts could not be credited. This able and impartial setting forth of the wrongs and indignities suffered by the Newfoundland people on the so-called French shore was kept secret in order not to wound the susceptibilities of our opponents. It gives a graphic description of English men-of-war's men, at the bidding of French officers, raiding poor settlers' houses, seizing their lobster boilers, and carrying them off in triumph for the sole crime that they had dared to fish in the open sea off their own shores.

For nearly a fortnight Sir R. Bond, the Newfoundland premier, has been negotiating with the Home Government, and the final outcome is an agreement which satisfies the whole colony with the exception of a few political opponents whose aim and object, hardly concealed, is to make political capital out of the alleged defects in the new convention for the coming general election in November next. As Sir Robert has an overwhelming majority in both branches of the Legislature, the ratification of the treaty by Parliament is a foregone conclusion. The premier deserves every credit for the firm and very efficient handling of the subject. The French, as we know to our sorrow, are terribly difficult people to deal with—like the Americans in similar fishery disputes.

In England all political parties rejoice over the settlement with France. Rosebery and John Morley are just as enthusiastic over the treaty as Chamberlain, Balfour, Lyttelton, and Lansdowne. The only apparently dissatisfied parties are the New England fisherman and the Newfoundland Opposition. Gloucester looked forward to the annulling of the Bait act, when she could coöperate with the French in obtaining a supply, and thus become free from the onerous and expensive Newfoundland regulations. She is bitterly disappointed at the result of the negotiations.

The main fight has been over the bait supply for the deep-sea fishery. Over and over again the local Government has been offered a total and complete surrender of the treaty coast in return for a free supply of bait. They have, however, remained firm. The Bait act still remains in force, and no fresh privileges are granted to them under the new arrangement. In addition to what has been published, there is a most important addition providing for an English consul at St. Pierre. This will put an end to the very extensive smuggling carried on for over a century. Every country but England was represented in the little island. The refusal to allow us a consul was a most unfriendly proceeding, but no diplomatic effort up to the present

had been able to obtain this most desired boon. St. Pierre lived by contraband; the consul meant its ruin; hence the resistance.

So old is this dispute that the treaty of Utrecht (1713) is only a modern incident in the course of its long career. It commences with the Armada year. After the annihilation of Spain's sea-power, France and England, who had both plundered her galleons, met face to face in the long fight for the dominion of the sea and empire in North America, which ended with Trafalgar and the surrender of Quebec. The rocky islets of St. Pierre and Miquelon, and these rights in Newfoundland, are all that remain to France after that mighty struggle.

A combination of events has brought about the present happy consummation. The King's tact and his great popularity have been one moving cause, but the most powerful levers have been the vanishing codfish and the disappearing lobster. The French fishery has been a poor, decaying business, and every year it has been getting worse. Where they used to have fifty establishments and 1,500 men on the northeast coast, in 1903 they had one ship and sixty men. Bonuses have been piled up, but the industry, in face of a falling catch, could not be sustained. A fishery carried on 2,000 miles from its base could never compete with a similar industry managed by settlers who have the cod and lobster and herring almost at their door. Worse, again, the French arrive only in June and leave in October. It is in May and October, when they are away, that the Newfoundlanders make the best hauls.

To understand the full effect of the Newfoundland part of the convention we must examine it a little more in detail. By the first article all the treaties under which France claimed exclusive fishing privileges in Newfoundland are swept away. The so-called French Shore becomes again English territory, entirely governed by English laws. This is the main point in the convention; all the rest is either leather or prunella. Article II. is all a pure diplomatic fiction inserted by the French negotiators "to save face," as the Chinese say, and to make the nation believe that there had been only a mere nominal surrender of a small share of their privileges, and that really valuable French fishery rights were still retained on the Treaty shore. The whole thing is a pure, unmitigated fraud. Observe Article III. and the elaborate arrangements for compensation. The traders will not only claim under this clause compensation for their old buildings and the good will and future profits of their business, but also damages for the dismissal of their old servants. I went over them all carefully, and my valuation would not represent a twentieth part of what is now claimed. Every solitary Frenchman on the shore is going to set up a claim, and we may be sure that they will be well paid. Selling out in this way means their complete exodus from the coast. They will depart, like the Israelites from Egypt, with their spoils. Does any one for a moment suppose that they will return to pay taxes and rents, and compete with the active and hardy natives on the shore? If they failed with exclusive rights and no duties and every advantage in their favor, will they have a chance to prosper now with everything against them and all the best fishing places sold to Englishmen? Not a solitary Gaul will come back, except it may be an odd Pierrois trading schooner to sell a few goods and smuggle some of their villanous German gin.

The departure of the French and the abrogation of the treaties will benefit the fishermen; but still greater benefits will result from the inflow of foreign capital, long scared away by these troublesome French claims. The west coast contains the very finest coast scenery in North America; its beautiful salmon rivers, its deer forests, are every year attracting a great company of tourists and sportsmen. Coal, copper, iron, and slate are abundant, and operations have commenced for their development. This will give all these industries a tremendous impetus.

D. W. Prowse.

St. Johns, Newfoundland, April 22, 1904.

THE GERMAN WOMAN.

To the Editor of The Nation:

Sir: It is fine when a German man (as happened recently in your columns) defends his fellow countrywomen against the charge of stolidity, but is the charge really ill-founded? To one who has known many German women of the utmost culture and charm, it would be pleasant to believe it, but general statements must be based upon the large average of the population. Things are changing with extreme rapidity in Germany—already the presence of women in the great universities (even in Berlin) no longer attracts attention; and the nation is admittedly so terribly *gründlich* that when once the idea of the intellectualization of women is thoroughly started, it is safe to predict that it will go far. But the situation at present? These are the words of Dr. Emil Reich in the *Fortnightly Review* for April:

"The German woman has not been nearly so active in the making of her country's history as has the woman of France. Her rôle is not nearly so important in public life, although . . . she is not in her youth cloistered and cooped up with the severity enforced upon the French girl. . . . After marriage, the German woman as a rule relapses into almost entire obscurity; the cares of her household absorb her thoroughly, and she becomes the *Hausfrau*, whose stolid dulness has become almost proverbial throughout Europe, and it must be admitted that this reputation is not quite unmerited."

Dr. Reich (in his admirable article on the "Future of Germany") does not see much hope for betterment, but in this he is surely too pessimistic. He says, after speaking of the great qualities of the Germans in intellectual pursuits:

"On the other hand, it is difficult to believe, judging from the past, that the Germans will ever be able to mature that ideal development of both man and woman which alone can be considered as the palm and prize of the highest form of civilization. . . . Germany runs the danger of quickening but little the onward march of women towards the ideal."

Christine Ladd Franklin.

Memphis, April 25, 1904.

THE NATIONAL EDITION OF WEBSTER.

To the Editor of The Nation:

Sir: During 1903 Little, Brown & Co. published the National Edition of the Writings of Daniel Webster in eighteen volumes. Those libraries and individuals that already own the regular edition of Webster in six volumes, and Private Correspondence in two volumes, both sets published by the same house, will be interested to know just how much new material they are getting for an investment of $90 in the new National Edition.

The six volumes in the regular edition have been inflated into twelve in the National, and the only new features are a dozen or two excellent pictures and facsimiles, an added chapter, 18 pages, in the Memoir, and the notes to Webster's "7th of March" speech. Volumes 17 and 18 are identical with the Private Correspondence, except that a few pages of unimportant appendix have been added. The new material, then, occurs in volumes 13 to 16 only, in a quantity equal to about two substantial octavo volumes, and consisting mainly of a miscellaneous collection of Webster's letters and addresses, hitherto uncollected and some of which have hitherto not been printed.

The worst feature of the National Edition is that there is no general index to the set—an inexcusable omission. Instead, there are three indexes, one in volume 12, one in volume 16, and one in volume 18—the latter, by the way, being followed by forty pages of printed matter, instead of being, as it should be, the last thing in the volume; and the items in the indexes in volumes 16 and 18 do not refer to volume numbers which are found on the backs of the set, but to certain sub-series of volumes not readily indicated.

For an investment of $90, then, one gets four volumes, which might have been put into two, of material not already available at moderate prices, and a set of 18 volumes, inadequately indexed.

Yours very truly,

J. L. Wyer, Jr., Librarian.

University, Lincoln, Neb., April 27, 1904.

Notes.

Professor Saintsbury is to preside over a selection from the chief works of the minor poets of the Caroline period, in two volumes, to be issued by the Clarendon Press.

McClure, Phillips & Co. have nearly ready 'Human Work,' by Mrs. Charlotte Perkins Gilman.

Harper & Bros. are bringing out 'The Fall of Feudalism in Ireland,' by Michael Davitt, and 'Success among Nations,' by Emil Reich.

Maurice Hewlett's novel, 'The Queen's Quair,' is to be published directly by Macmillan Co., and his book on Tuscany, with illustrations by Joseph Pennell, in the early fall.

Maxfield Parrish proved himself the right man in the right place when illustrating Kenneth Grahame's 'Dream Days' (John Lane), and he has now rendered a like service to the same publisher and author and to the public in the case of 'The Golden Age.' Mr. Parrish's classic manner fits the style and matter of these books admirably; is highly decorative and, even in its humor, always in keeping—as John Tenniel betwixt *Punch* and 'Alice in Wonderland.' The typography has a liberal elegance.

A wordy and non-committal introduction is supplied by Senator Lodge to a volume

of 'Addresses and Presidential Messages of Theodore Roosevelt, 1902-1904,' just issued in a duodecimo volume of nearly five hundred pages by G. P. Putnam's Sons. The President, "a man of the highest education," is held up for entire sincerity of speech, truthfulness, courage, and apostolic exhortation "to awake to righteousness and sin not." Mr. Lodge elaborately contrasts this sort of campaign document with "the formal political or campaign biography so much in favor in former days," but now "very much out of fashion." However, unless "formal" is insisted upon, Leupp's 'The Man Roosevelt' and Riis's 'Roosevelt the Citizen' would seem to keep the tradition tolerably alive.

Like its predecessor in the series of translations of historical documents entitled "The Philippine Islands, 1493-1898" (Cleveland: The Arthur H. Clark Co.), volume xi. is made up almost exclusively of transcripts from the original documents in the Spanish archives at Seville. Concluding the year 1599, it presents the ordinances adopted by the Audiencia at Manila, the majority of them pertaining to details of administration. Three ordinances enjoining respect for native customs and prescribing an abbreviated procedure for cases in court to which natives are parties, are of interest; so also are the ordinances for punishing offences committed by the Chinese—their most gross immorality to be requited by burning alive. It is stated that the Chinese who become converts to Christianity thereupon become slothful. Most of the contents of volume xi. centre, however, in one way or another, about the repulse (though not with entire success) of Dutch privateers at the mouth of Manila Bay in 1600. Auditor Morga, who had charge of the defence, is charged with incompetence, and for two years the factional fights of what are evidently two parties of office-holders in the islands are waged in the courts at Manila and before the King in his Council of the Indies. A new Governor-General, Pedro de Acuña, takes charge in 1602, under strict orders from Philip III. (as usual, in such cases) to refrain from nepotism and correct all evils of favoritism. There is also an interesting letter from the Jesuit, Father Vaez, covering the doings of his order in the Philippine Islands in 1601. This sort of material speedily multiplies from now on in Philippine history, and the proper selection of it will demand wary walking on the part of the editors. They have illustrated the Vaez letter with facsimiles of the first two books which reproduced it, an Italian work brought out at Milan in 1603, and a publication of Jesuit letters in Latin at Antwerp in 1605.

Mary E. Burt's title, 'Poems that Every Child Should Know,' and sub-title, "A Selection of the Best Poems of All Times for Young People" (Doubleday, Page & Co.), are directly challengeable. The proposition in the preface that "there is a *duty* in the matter of learning poetry" cannot bring Jeremiah Eames Rankin's "The Babie," for instance, into the category of "poems that every child should know"; nor is this, in turn, nor Knox's "Mortality," nor Moore's "The Light of Other Days," nor Arnold's "The Forsaken Merman," nor Kipling's "True Royalty," nor Mrs. Hemans's "The Voice of Spring," nor Chambers's "The Recruit," nor Payne's "Home, Sweet Home," nor Lanier's "Barnacles," nor many another here bound up, among the best poems of all time. Some examples are no more than doggerel. Why not be content to make a plain offering of a new anthology for the young, and to suppress extravagant pretensions? The present selection implies a large latitude for what is childish or even youthful.

The key to the mystical poetry of Mr. Yeats, with its wavering rhythms and ideas that too often, for all their beauty, are the confused utterance of a dream-burdened mind, should be sought first of all in his own critical Essays, or in Mr. Arthur Symons's 'The Symbolist Movement in Literature.' But of the number who heard Mr. Yeats lecture during his recent American tour there must be many who would find his 'Ideas of Good and Evil' too vague and indefinite an introduction to the symbolism which makes so many of his poems read like riddles. For such a reader Mr. Horatio Sheafe Krans designed his 'William Butler Yeats and the Irish Literary Revival' (McClure, Phillips & Co.), a clearly written, matter-of-fact little handbook which reviews all of Mr. Yeats's prose, poetry, and plays, and explains briefly the poet's aims, and his place in the Gaelic revival, which has already achieved so much in Ireland. Mr. Krans is himself no mystic. He is intelligent enough to appreciate the æsthetic value of symbolism employed as Shakspere employed it, to give a touch of "natural magic"; and he realizes that to sow one's symbols "with the whole sack," as Mr. Yeats frequently does, is to be more profound than intelligible. His book, therefore, is a fairly safe guide for one embarking on a course of Mr. Yeats, and it is full of well-chosen quotations from the poems that have been inspired in the last decade by the return to imagination which is the aim of the Irish poet and his friends.

It is a poor soul indeed that, having seen Switzerland, does not love her. It is a poorer soul that allows itself to be jealous of her other lovers, even when they vaunt their love in public. Yet it is but human to challenge within one's own breast their right to proclaim their passion so boldly, unless they can by some special charm of manner or newness of praise prove their devotion more appreciative than that which has previously been uttered or is still silently cherished. Canon Rawnsley has selected a dulcet title for his travel-sketches, 'Flower-Time in the Oberland' (Glasgow: MacLehose), and writes in his wonted style of easy, personal narrative. Yet it may be questioned whether he has entirely justified his title or his publication. His account is not innocent of flowers, but they give no especial tone to the book, which might about as well have been written in June or July as in May. The aspects and experiences which the author dwells upon are of familiar places and familiar types. Yet the book furnishes pleasant reading. The last third of it is devoted to Lucerne, and in this portion is reprinted an interesting account, that had been previously published, of the revival of older styles of house-decoration in that hospitable city. A few misprints need correction. They are chiefly in German words. Probably among them is to be reckoned "wonderschon" (p. 124). It appears to us hardly likely that the transports of either enthusiasm or dialect can account for that form, despite the author's asseveration that his German companion uttered it repeatedly. And it is curious to find an English Churchman writing of experiences in Lucerne in 1903, and setting down the English Church in that city as in the Weggisgasse (p. 294). Can it be that the good Canon goes a-Maying on Sunday when away from home? St. Mark's is a pretty granite structure in the Haldenstrasse, far to the eastward, and was built in 1898-99.

'Pompeii,' translated from the German of R. Engelmann (Scribners), is the first of a new series called "Famous Art Cities," projected by the house of Seemann at Leipzig. It is a large octavo of 112 pages, in flexible covers, easy to stow away in one's handbag; and it gives in small compass a good account of the things most worth seeing in the resurrected town. The 144 illustrations, very well executed and chiefly from photographs, make it a useful appendix to the ordinary guidebook. It may safely be recommended for its accuracy, not only to travellers, but to all who wish to get some idea of Pompeii without leaving their firesides at home.

'Lyra Germanica-Latina' is the title of a little book in which Mr. Waldemar Kloss of Belleville, Ill., has gathered his own translations in rhymed Latin verses of some forty familiar German folk and student songs (St. Louis: Office of the *Amerika*). The verses are intended to be in the metres of the originals so that they may be sung to the well-known tunes, and in general they do indeed fit pretty well. But the "Einst hat mir mein Leibarzt geboten" becomes iambic from anapæstic, and the version of "Wohlauf noch getrunken" not only is not in the metre of the original, but seems to be in no metre at all. However, it matters little, for the good old days are gone when students were wont to sing in Latin over their beer, and in this country only the surviving relics of the past can join in the words of even "Lauriger Horatius" or "Gaudeamus." This new *Lyra* will, we fear, be struck by few save the bard and his immediate friends.

Those who care to know everything that is known and, up to the present date, knowable of that both simple and mysterious *cause célèbre*, the Dreyfus case, will find it summed up in a clear, concise, and very complete little book that an anonymous writer has just published under the title: 'Histoire Sommaire de l'Affaire Dreyfus' (Paris: Georges Bellais). The author has followed Joseph Reinach's big history, of which four volumes are already finished, than which there is no more exhaustive and, on the whole, more trustworthy authority on the matter, if we except a few questionable interpretations of the remaining litigious points. As to these the present author has not committed himself. In 186 pages he has condensed all the essential and now generally accepted facts in the case from the discovery of the *bordereau* in September, 1894, down to the latest verdict of the Court of Cassation (March 5, 1904) granting the request for a revision. He dispenses the reader from perusing the twelve volumes of judicial proceedings and the countless volumes of Dreyfus literature. The substance of them all is here, including the latest discoveries made since the Rennes sentence, showing that documents had been falsified

and antedated to be used against the innocent man in the second trial. The chronology and bibliography that accompany this brief history, its judicious comments on the moral and political repercussions of the case, its general tone of moderation and fairness, go to make an invaluable handbook for those who wish to talk sanely about a subject that, more than any other, has evoked on all sides a great deal of passion and nonsense.

The complexity of the glacial record in the Northern States is hardly more astonishing than the success with which it has been deciphered. A second monograph, by Frank Leverett, treating the 'Glacial Formations and Drainage Features of the Erie and Ohio Basins' (Monograph XLI., U. S. Geology Survey), makes a fitting sequel to an earlier volume by the same author, on 'The Illinois Glacial Lobe,' and sets forth in the clearest fashion an extraordinary body of well-observed facts on which the glacial theory now stands so firmly established. Among a multitude of interesting features, mention may be directed to two of special significance; one is the graceful looping of the terminal moraines on the southern border of the Erie Glacial Lobe—they may indeed be described as festooned between Bellefontaine and Mansfield. The other is the channel by which the glacial lake of northern Ohio came to be drained across southern Michigan. Both of these features had previously been discovered and described; they are here set forth in relation to the whole history in which they are but incidents. It is unfortunate that we have no popular book in which an adequate account of the glacial period in the upper Ohio and Mississippi valleys is available for the general reader.

The geographical pivot of history is the subject of a stimulating paper by H. J. Mackinder in the *Geographical Journal* for April. It is an attempt to exhibit human history as part of the life of the world organism by showing how the successive invasions of the Asiatic nomads from the steppe-land (the pivot) moulded the settled peoples of Europe. In some measure the strategic advantages of these nomads has been neutralized by the development of mobility upon the ocean. But the steppe-land is about to be covered with a network of railways giving a mobility of military and economic power greater than that of the sea, so that it will continue to be the pivot region of the world's politics. In the discussion which followed the reading of the paper before the Royal Geographical Society, one speaker suggested that when the air becomes a means of locomotion, a great deal of this geographical distribution must lose its importance, and the successful powers will be those which have the greatest industrial basis. Other articles are upon Mantchuria and Korea, recent Russian travel and research in Asia, and the fresh-water lochs of Scotland.

The National Ethnographic Museum of Leyden, one of the first in Europe and the oldest in the Occident, has been for the past ten years under the direction of Dr. J. E. Schmeltz, who sends forth his annual report for 1903, showing constant communication with the Far Eastern nations and the people of Insulinde, as the Dutch writers call the Dutch East Indies, or Island India. The additions to the library reveal especial richness in those works which can be bought not on the counters of the average, or even special, bookshop, but may be obtained only by careful scrutiny and the application of time and wit, being often scholarly work of the highest order, but done by men whose publishers are obscure and whose income is apt to be a minus quantity. The chapter on the use made of the Museum shows that specialists, both natives of Japan and of Western countries, make frequent and particular use of the Japanese collection, more than of any other, since they know well the riches of this famous institution. The eight plates decidedly enrich the text, being devoted especially to the art of the nations of continental and insular Asia.

In the budget of the Secretary for Finances in Egypt, interesting details for the erection of the railroad from Berber on the Nile to Suakin on the Red Sea are given. The preliminary surveys and estimates have already been made, and now the moneys have been appropriated—in all, 1,770,000 Egyptian pounds. Work will be begun at once, and it is expected that in three years the road can be opened to traffic—a great event, for economic and political reasons.

According to the official reports for the semester recently closed, there were in attendance at the twenty-one universities of Germany 1,477 women, of whom only 54 were matriculated—namely, 28 in Heidelberg and 26 in Freiburg—as the privileges of matriculation in the three Bavarian universities of Munich, Erlangen, and Würzburg begins only with the present semester. The women contingent may have been even a little larger, as two of these institutions, Münster and Greifswald, do not distinguish between "Hoerer" und "Hoererinnen." Notwithstanding the rigid conditions prevailing in Berlin, the number of women in attendance there is practically as great as ever, having been 562. The reports of the other schools are as follows: Munich, 22; Leipzig, 62; Bonn, 89; Breslau, 98; Halle, 51; Göttingen, 58; Tübingen, 3; Heidelberg, 53 (not matriculated); Strassburg, 103; Freiburg, 85 (not matriculated); Würzburg, 75; Marburg, 18; Giessen, 11; Erlangen, 10; Königsberg, 67; Jena, 50; Kiel, 20; Rostock, 6.

The new 'Thesaurus Linguæ Latinæ,' which is being published by the joint Academies of Sciences in Germany, and of which eleven parts, covering the greater portion of the letter A, have appeared, is having a very encouraging sale. The Cologne *Gazette* reports that there are more than 1,500 subscribers, an exceptionally large number of copies going to foreign parts, especially to North America. This success is very gratifying to the German Academies, whose finances were being severely taxed by the expenses of this immense undertaking. It is announced that completion cannot be expected short of twelve years.

—The instalment of letters from John Ruskin to Charles Eliot Norton easily takes the lead in interest among the contents of the May *Atlantic*. The long and intimate friendship between the two men, beginning in 1855 and continuing until death intervened, gave to Professor Norton a rare opportunity of forming an adequate appreciation of Ruskin's life and character. We have in the present number a brief but effective sketch of the home life, in which the ruling influence was the mother, "a personage who seemed rather a contemporary of Miss Austen's characters than of the actual generation." Though Ruskin was then thirty-six years of age, her attitude towards him was that of the watchful mother of a child not yet arrived at the years of discretion, though escaped from her control in matters outside of an immediate personal relation. The father had the air of a cultured English gentleman rather than a man of business, was an agreeable host, considerate in manner, well acquainted with the masters of English literature, and possessed of an unusual interest and taste in matters pertaining to the arts. Ruskin's own statements as to the serious deficiencies of his home life in developing the powers of independent judgment and self-control are strongly corroborated by Professor Norton's recollections. Ruskin's first acquaintance with Lowell's poetry came through a volume handed to him by Professor Norton at Geneva, in 1856, and a warm note of appreciation was returned on the following day. His delight in the spirit and fervor of the 'Fable for Critics' should be suggestive reading to the modern Harvard historian of our literature, who found himself unable to imagine how any one could find interest enough in that poem to give it the brief time necessary for its perusal. As to the other poems, "it is very interesting to see the stern seriousness of a man so little soured—so fresh and young at heart." Mr. Norton found in Ruskin a delightful personality, unpretentious, gentle, and considerate of the feelings of others, and entirely free, in his talk, from the air of dogmatism and arbitrary assertion often noticed in his writings.

—Col. Higginson's paper is devoted to the negro problem, the main thesis being simply that the negro is intensely human, and must be dealt with as a human being. The insistent idea that the former slaveholders are the only persons who have ever really understood the negro, is summarily and effectually dealt with. Many of the anti-slavery leaders had had ample experience to study slavery at first hand, and were in better position to forecast what the blacks might become under freedom than were their owners. Mr. Higginson deals forcibly, too, with the claim that lynching is done in defence of chastity. Let the color of the respective parties in any case of assault be reversed, and the alleged ungovernable regard for chastity evaporates at once, showing conclusively that caste, and not chastity, is at the root of the matter. Frederick J. Turner begins a series of papers on the diplomatic contest for the Mississippi Valley, with an ominous reference to our nation's progress towards the fulfilment of "its destiny on the Pacific *and in South America*." The editor lightens a number unusually full of matter for serious thought with a half-dozen pages on "Fishing with a Worm." Stephen Gwynn's recent book holds that the worm fisherman is *capable de tout*, because a wretch who came under his own observation caught a trout on a worm, and proceeded to kill it by biting through its head with his teeth; but Mr. Perry demonstrates that a man may remain a gentleman and still catch his fish

with a worm on due occasion, now as in the days of Walton.

—The May *Harper's* opens with Abbey's illustrations of "Hamlet." The accompanying critical comment, by Theodore Watts-Dunton, is largely an assault on the alleged wrongheadedness of German Shaksperian criticism. The Germans will insist upon putting Shakspere in with the "tribe of Ben," who work their imaginations along carefully studied lines of logical consistency, not with "the tribe of Nature's children," whose imaginations work them, and who are therefore as shaky in their logic as Nature herself. Regardless of the fact that scarcely one of Shakspere's plots was even partially invented by himself, the Germans go on writing long treatises upon the profound philosophical and allegorical intent of these plots. But Shakspere did not write plays, we are told, in order to find an outlet for his own thoughts and emotions. The dramatic instinct has no great need of expression except some need which impinges upon it from the outside, and that in Shakspere's case was the need of bread and butter. Hence he was forced to harness his genius to business, and he "harnessed it far too thoroughly to dream of producing plays for the purpose of expressing that great inner life of his which circumstance and temperament had been building up." The Globe Theatre, wanting a Hamlet, tapped the Shaksperian tree and furnished the channel wherein should flow the poetic "gum, which oozes from whence 'tis nourished." It may be asked here whether a dramatist who had thus thoroughly harnessed his genius to the business of getting a living out of the demands of the Globe Theatre, could correctly be said to be worked by his imagination, and not to be working it; but it would be cruel to deny to Mr. Watts-Dunton himself a strain of that shaky logic to which he assigns so high a place in Nature and Nature's children. An interesting idea offered in conclusion is that Shakspere was so full of Hamlet that "Hamlet thoughts," of the general character of the famous soliloquy, overflowed from the full mould into many of his other productions, notably "Macbeth," regardless often of the character of the men who were thus forcibly drafted into the service of giving them utterance.

—The May *Century* opens with a paper by Henry Norman on the "Mother of Parliaments," dealing not so much, however, with her essential characteristics as a mother as with the various whims and crotchets which the old lady has developed during her prolonged career. Mr. Norman expresses his confident anticipation of the erection of a parliament at Dublin for Irish affairs, and of the abolition of gratuitous service in Parliament. A very interesting paper deals with the "Lost Art of the Daguerreotype." The writer is Abraham Bogardus, one of the successful devotees of the art a half century ago, at the height of its development. Among the illustrations, all from daguerreotypes, of course, are portraits of Daguerre himself, Joseph H. Choate at the time of his graduation from Harvard, Edward Noyes Westcott in childhood, Mary Mapes Dodge, and Edmund Clarence Stedman. Under the caption "History by Camera," George F. Parker gives an account of the Sir John Benjamin Stone collection of photographs to be exhibited at St. Louis in illustration of the history, antiquities, social life, etc., of Great Britain. Korea is discussed by the Rev. Arthur Judson Brown, of the Presbyterian Board of Foreign Missions, and Homer B. Hulbert, editor of the *Korea Review*. The former deals mainly with the country's present sad condition, the latter with its future under the one or the other of its would-be masters.

—There is always some fresh way to regard the Yellowstone National Park, and the May *Scribner's* considers it from a scientific point of view of its geyser basins, under the light of a group of color illustrations by Dwight L. Elmendorf. Arnold Hague is the competent writer. Capt. Mahan's fifth paper on the War of 1812 deals with the opening of actual conflict, the privateering operations of the two belligerents, and the actions between the *Wasp* and the *Frolic*, and the *United States* and the *Macedonian*. The "Field of Art" is given up to notes on Whistler, by Kenyon Cox, Frank Fowler, and Harper Pennington. Whistler's doctrines of art, Mr. Cox holds, at least explain the aims and tendencies of his own work, however inadequate they may be when applied outside those limits. Trying purposely to dissociate himself from representation, "his manner grew ever lighter and slighter, and he reduced art to a hint of composition, a ghost of color, little more than a memory of material—an art of subtleties, of nuances, of infinite refinements." The worst enemy to his art was the author of the 'Gentle Art of Making Enemies,' inasmuch as the writer was so amusing that people thought the painter a humorist too. Mr. Cox's note is quite sympathetic, Mr. Pennington's a warm defence, while Mr. Fowler is not disposed to pass the claims of Whistler's adherents without serious question. The best of the artist's work, he thinks, is precisely that in which there is least of his peculiar characteristics, preeminently his portraits of his Mother and of Thomas Carlyle, "two masterpieces by one who may not perhaps unqualifiedly be named master."

—The roads of the world lie open to the philosophic tramp; even Tibet he may essay if his philosophy be Buddhistic, and if there are any tracks there to speak of. So the roads of Spain stretched north from Algeciras for Mr. Bart Kennedy, and he swung out on the long trail through a land that has known more of the recorded wanderings of genius than perhaps any other. But his is a refreshingly new and different record. From being a sailor with a stoke-hole experience, an actor in a strolling troop, an engineer of some kind, a voice in Italian opera chorus, a journalist, a tramp at large, he started across Spain, absolutely innocent of Spanish, simply to see and to admire. He had the eyes and had the knack—had luck as well—and so he emerged on the French frontier at Hospitalet in safety, and has given us in his 'Tramp in Spain' (Frederick Warne & Co.) a report the most living and grasping since Miss Bates's 'Spanish Highways.' But this is a very different book, very masculine, full of the comradeship of men, impressionistic, and not *genre* work, but with the same reality and inherent truth. Of literature it takes no account. Not even Don Quixote is mentioned once in it; and Cervantes only to point the terror of the reiteration of his name at Alcalá de Henares. The writer's track from Jaen to Toledo took him straight through the country where Sancho Panza had trudged and Dapple trotted, but over that stretch a discreet veil is drawn. Evidently of purpose are we kept facing the people of Spain, by its roadsides and in its taverns. And yet, for all this reality, the smallness and frowziness of ordinary life are not allowed to oppress us. The wind of the road blows clear, and the sun shines, and the rain falls, and the long solitary reaches of the tramper's life give broad views of country and character. As always with the true wanderer on his feet, there went much philosophy to the making of this book—a philosophy cast in somewhat jerky and over-pungent form, but human nevertheless. If Mr. Kennedy will now learn Spanish, tramp through Spain again, and give us a new series of impressions, he will, between the two, have produced a unique thing. As it is, though he has little use for republics—always excepting that of Andorra—and calls this land of liberty "the great sham republic," he has touched the pulse of universal brotherhood and sympathy, and has brought the peoples of the Peninsula more than a step nearer to us.

—Following upon Baldwin's 'Dictionary of Philosophy and Psychology' for English-speaking people, and Eisler's for the Germans, there is now appearing for the French a 'Vocabulaire Technique et Critique de la Philosophie' (Paris: Armand Colin), under the charge of MM. Lalande, Couturat, Belot, and Delbos, with the aid of a distinguished corps of assistants. There is a generous scheme of printing by which fascicles are sent out in a preliminary form to a number of persons even outside of France for suggestion and comment; three-fourths of the page being left vacant for this purpose. The plan of this vocabulary does not embrace the encyclopædic feature of Baldwin's Dictionary nor the voluminous quotations from authors of Eisler's. Philosophy proper and the normative sciences constitute its main theme, and psychology and sociology come in only as their terms are of general philosophical import. This difference of emphasis is the cause of a difference of character in the two dictionaries (aside from the great difference in size): the French has almost a leaning to a scholastic quality (it gives, for instance, separate articles to all the moods of the Syllogism), while the English may almost seem to envisage the time when philosophy shall suffer extinction at the hand of psychology. The subject of Symbolic Logic, to which Philosophy has usually been an unfeeling step-mother, is sure to receive a good setting out at the hands of M. Couturat; it is known that he is already engaged in writing an important work on this subject. In general, the definitions have the clearness and precision which are sure to characterize the work of French savants; and the many suggestions in the way of distribution of meanings between loosely synonymous terms, and the exclusion of meanings that tend only to vagueness, are without exception valuable.

—Lord Cromer's annual report on Egypt shows in an unusual degree the good sense, moderation, and ability which have characterized these state papers for the twenty years of his service. The financial prosperity of the country continues, the actual surplus of revenue over expenditures for

1903 being more than ten million dollars. The amount at the disposal of the Government, however, for the reduction of taxation is less than four million, the remainder being under the control of the representatives of the Powers who signed the London Convention of 1885. This anomalous system of finance is abolished by the recent Anglo-French Agreement, to which there is little doubt the other signatories, Austria, Germany, Italy, and Russia, will give their consent. Equal success has attended the efforts of the Government to maintain in existence a peasant proprietary class and to encourage its growth. The principal measures to this end have been large reductions in the land tax, improved irrigation, the sale of Government land in small lots paid for by annuities, the abolition of octroi duties, the freeing of the navigation of the Nile, the reduction of the railway tariff, but especially the establishment of banks for making loans to small farmers. In the five years of their existence these loans have increased from one hundred thousand dollars to 870 borrowers at the start, to nearly eleven million dollars to eighty thousand of the fellaheen. Referring to the cost, some fourteen million dollars, of the Assuan Dam and Assiut Barrage, Lord Cromer says with this moderate expenditure "more good has been done to the people of Egypt than by the five hundred million dollars of debt which Ismail Pasha contracted and, for the most part, squandered." An evidence of this is the fact that the bad Nile of 1902 caused an increase of only 13 per cent. of imports of cereals, while the increase in 1900, due mainly to the low Nile of the previous year, was 78 per cent. The development of the mineral resources of the country is still in its infancy, but "nearly all the Egyptian territory lying between the Nile and the Red Sea has now been allotted to private syndicates." With regard to the Sudan, Lord Cromer says that the work of civilizing it is "being carried on with zeal, energy, and intelligence." The tranquillity of the people has not been disturbed by the appearance of a new Mahdi nor by the rising of the Mad Mullah in Somaliland. "On the contrary, everywhere there is displayed greater keenness on the part of the people to improve their material position and to occupy themselves in agricultural and commercial pursuits." Among other signs of progress was the erection of 1,000 new water-wheels and the digging of five small flood-canals.

WALDSEEMÜLLER REDIVIVUS.

The Oldest Map with the Name America of the Year 1507, and the Carta Marina of the Year 1516, by M. Waldseemüller (Ilacomylus). Edited by Prof. Jos. Fischer and Prof. Fr. R. v. Wieser. London: Henry Stevens' Son & Stiles. Folio, pp. 55, and 27 plates.

It is comparatively easy, and by no means an uncommon exploit of scholarship, to prove that the world has entirely forgotten the name of one or another of those who deserve to be remembered because of what they accomplished in advancing the common stock of knowledge. It is much more difficult, and a great deal more important, to secure for such a forgotten worthy the widespread recognition which makes the details of what he wrote or did familiar to every well-read person. The name of Martin Waldseemüller has long been known to students of the discovery of America, and it has frequently been explained that the fact that he gave to the New World its name entitles him to an honored position in the popular memory. But the additional explanation had always to be made that he suggested the name under a misapprehension based upon partial information, and the public mind very properly refused to remember him with any especial gratitude. A lucky piece of good fortune, the chance finding of an old volume in the year 1901, renders it necessary to endeavor to change this popular attitude toward the man who christened America. Two maps have come to light which were drawn by Waldseemüller, and which seem to prove that he deserves a position of the highest eminence among geographers. They show him to have been gifted with uncommon keenness in appreciating the relationship between scattered bits of information gathered from chroniclers and travellers, with sound judgment in selecting what was probably true from among the mass of what was merely surmised, and with accurate imagination in reconstructing the outlines of the known world. More than all this, he made an impression upon the knowledge of his contemporaries, who adopted his map as a standard, and used it as a basis upon which to build up the new world-outline made necessary by the reports of the voyagers who completed the work of Columbus and Vasco da Gama.

The Jesuit College at Feldkirch borders the two sides of a mountain torrent which comes down from the Austrian Alps, a few miles south of Lake Constance. Here, while his colleagues carry on their work with the aid of the most modern appliances in the scientific branches, Father Joseph Fischer has for several years been studying the early geographical history of northern Europe, with particular reference to the westward voyages of the Scandinavians. A thorough and well-equipped student, trained by Professor Wieser of Innsbruck, he carried his researches far beyond the limits ordinarily reached, even in European libraries. In his quest for material, he was led to Wolfegg Castle in Würtemberg, which guards the accumulations of many generations of book and picture-loving German lords. Fürst Franz von Waldburg of Wolfegg-Waldsee is the worthy scion of the family, fond of his library with its priceless collection of Dürer's engravings, and equally fond of chatting with his foresters while he takes his beer on the well-worn benches of the village inn, where the tenants are most apt to find him of an evening, ready to give good advice or comforting sympathy in response to their tales of domestic discord or barnyard miscarriage. Near by is the quadrangular castle, with grand old baronial halls and lofty chambers hung with tapestries as fresh and bright as if just received from the Gobelins, serving as background to the well-kept armor of the knights, who also appreciated these things in long-gone centuries.

This was the setting to which Professor Fischer was welcomed in response to his request for permission to search for early maps of Scandinavia. As he looked along the shelves of the castle library, the heavily banded hogskin back of a tall folio volume attracted his attention. Its thick, red-beech sides were covered with leather impressed with early sixteenth-century ornaments, and held closed by solid brass clasps worked in Gothic style. Within, in addition to two single-sheet maps already known to students of cartography, were found the sheets of two large wall maps, each consisting of twelve separate sheets printed from wood blocks, measuring about 24x17 inches, making the map, when mounted, nearly eight feet by four and a quarter. On the inner side of the front cover was the book-plate of Johann Schöner, one of the best-known geographers of the early sixteenth century, containing the proud motto, which now seems to have a curiously prophetic significance:

"Hoc te, posteritas, Schönerus munere donat,
Quo stante, ingenij stant monumenta sui."

Seventy-five years ago, while at work on his 'Examen Critique de l'Histoire de la Géographie du Nouveau Continent,' Alexander von Humboldt made the interesting announcement that the earliest recorded use of the name America was in the year 1507, under circumstances which showed with quite unusual clearness exactly how it came to be selected as a name for the newly discovered region. A group of scholars had been brought together during the first decade of the sixteenth century in the little town of St. Dié, in the Vosges mountains, halfway between Strassburg and Nancy. One of the group, who professed geography, was Martin Waldseemüller, who sometimes gave his name the classical form of Ilacomylus. A number of letters written by him, and by others of the group, have been preserved, which show that about the year 1505 he was busily engaged in the preparation of a number of publications—a new edition of Ptolemy's geography; a globe upon which the portions of the earth made known by the discoveries of the preceding half-century should have their correct relative locations; a large map of sufficient size to give room for representing the details of geographical information regarding the old as well as the new-found world; and a text-book which should explain the meaning of geographical terms and the symbolism of cartography. This text-book was issued from the private press of the St. Dié Academy in the spring of 1507. In it, as Humboldt noticed, occurred the suggestion which was destined so profoundly to affect nomenclature: "alia quarta pars [mundi] per Americum Vesputium . . . inventa est, quam non video cur quis jure vetet ab Americo inventore, sagacis ingenij viro, Amerigen quasi Americi terram, sive Americam, dicendam: cum et Europa et Asia a mulieribus sua sortita sint nomina."

Humboldt also called attention to other extracts from this 'Cosmographiæ Introductio,' which state that the text-book was designed to accompany a map, "tam in solido quam plano depinximus"; which doubtless means that there was a globe as well as a map. The map is described with considerable detail, as having flags or escutcheons to mark the various countries, and crosses where the sea-way was dangerous for shipping, so that its identification, whenever a copy should be seen, was

comparatively easy. Humboldt was, however, unable to find a map answering the requirements. Ever since his day, speculation has been rife, in the intervals of wondering what had become of Waldseemüller's "America" map, in guessing about its probable geographical character. The most plausible suggestion was that it resembled one of the two maps showing the newly discovered regions, themselves radically different from one another, which were included in the edition of Ptolemy upon which Waldseemüller was at work in 1505, but which was not published until eight years later. The facts that neither of these maps bore the name America, and that one of them (the one with which Waldseemüller is more specifically connected) contained geographical features which became antiquated in the interval between 1505 and 1513, gave rise to additional speculation. The other maps of the second and third decades of that century, which might have shown traces of Waldseemüller's influence, bore such slight relation to the Ptolemy maps of 1513 as to give occasion for the most diverse ideas. It is hard to imagine a greater conglomeration of opinions than existed regarding the probable character of this map prior to Professor Fischer's announcement that he had found a copy of it.

One important result of the reappearance of Waldseemüller's 1507 map is the revelation of the very unsatisfactory condition of current knowledge of historical geography. Professor Fischer's discovery has practically destroyed the value of every opinion previously held in regard to the state of geographical knowledge at the beginning of the sixteenth century. Harrisse's magnificent work in cataloguing the recorded maps, Nordenskiöld's scholarly surveys of early cartographical material, the thorough studies of special subjects by Wieser and Ruge, will always retain their place. No one, however, had been able to appreciate to any exact degree what these maps reveal regarding the extent and the limitations of the information available to the academic investigator in the heart of the Vosges mountains, or to realize that most of the contemporary maps published by the professional geographers were strongly influenced by this single prototype. Professor Fischer has already done much to explain the maps, but he would be the first to recognize that his very careful and scholarly introduction to the facsimiles will be of most use as a basis for further studies of detail. His opinion that the 1507 "America" map is a direct copy from the well-known Canerio chart seems hardly justified, and the evidence which led him to think that Schöner's copy of the 1516 "Carta Marina" consisted of "proof-sheets" is more likely to prove merely that Schöner studied this particular map carefully, pen in hand. Many of the suggestions regarding Waldseemüller's sources, especially for Africa and the further East, need very cautious re-examination. The publication of these maps, of the wholly unsuspected 1516 sea chart quite as much as the long-sought 1507 "America" map, makes it necessary to reconsider the entire question of what European scholars and men of affairs at that time knew about the rapidly extending "known world." These maps show that the assumption that exact information was largely confined to the seafarers and their employers, and to the governmental navigation bureaus—an assumption fully justified by the maps previously known—must be abandoned. The problems connected with the relationship of maps, their parentage and family connections, which Harrisse has done so much to expound, must now be taken up afresh. Closely connected with this is the question of the personal obligation to one another of the men who dealt with scientific geography in the early sixteenth century. Professor Fischer has furnished the clue for the solution of many of these matters, and there is ample justification for the hope that he is the harbinger of a widespread revival of scholarly interest in the whole subject of geographical history.

SIX NOVELS.

The Stolen Emperor. By Mrs. Hugh Fraser. Dodd, Mead & Co.

The Story of Susan. By Mrs. Henry Dudeney. Dodd, Mead & Co.

The Issues of Life. By Mrs. John Van Vorst. Doubleday, Page & Co.

To Windward. By Henry C. Rowland. A. S. Barnes & Co.

Susannah and One Other. By E. Maria Albanesi. McClure, Phillips & Co.

A Little Tragedy at Tien-Tsin. By Frances Aymar Mathews. Robert Grier Cooke.

When the events warranted in Mrs. Fraser's tale, 'The Stolen Emperor,' took place, the real ruler of Japan was neither a Mikado nor a Shogun, but a great Regent, Hojo Yasutoke. This exalted personage, whose power appears to have been self-constituted and self-sustained, could keep a Shogun in bondage in a remote part of the empire and a Mikado in abject subjection in his own imperial palace of Kioto, but he depended for the safety and continuity of the empire on the fighting daimios, "the men who had withstood the temptation of being drawn into the corrupt and effeminate official life of Kioto, and who, as heads of the provinces they had subdued and the armies that had conquered them, constituted the military as distinguished from the civil or court aristocracy." The Regent's way of perpetuating his own rule was to denounce an emperor as imbecile or incompetent just when he was attaining his majority, banish or kill him, and set up as a figurehead for loyal worship a baby emperor who could not for many years be able to assert any divine authority or even attempt to turn the tables on Yasutoke. This habit of the Regent's was a matter of common gossip in Kioto, and when it was known that a very powerful daimio, Kashima, had been summoned to confer with Yasutoke, it was pretty well understood that the object of the conference was to get Kashima's consent to the deposition of the Emperor, Go-Horikawa, and his recognition of the son of that feeble youth and his consort the Princess Jito Sama, a woman most fair, virtuous, and wise.

The story opens with the coming of Kashima to Kioto, and a fine description of that pomp and splendor with which great feudal barons (perhaps without ironical intention) always emphasized an act of homage to the overlord. In the conferences with Kashima Yasutoke displays less astuteness than might be expected in such a practised negotiator of crime, and never suspects that the daimio's complaisance may conceal a sinister motive. The Regent had the disadvantage of age dealing with youth; he had forgotten to reckon with the dangerous and unruly passion of love. So, while he was congratulating himself on the daimio's easy compliance, Kashima was preparing to carry out the real purpose of his visit to Kioto—nothing less than the abduction of the Empress Jito, whom he had but once seen, then loved forever. The conception of Kashima's scheme is so bold and the subsequent devices for accomplishing his wild will are so simple, impulsive, and unscrupulous, that he may well be the hero of a national legend; and, if the tale is an invention, the character of a mediæval robber baron has been kept close to probability. Kashima is an aristocrat, bold and strong, single of purpose, sudden in action, altogether primitive. In the end he is thwarted and defeated, but not because he has reflected or wavered or felt any sentimental compunction about killing a dozen baby emperors, should they stand between him and his desire. The tale, in itself novel and exciting, is well and sympathetically told, and quite too good to be commended only as a "timely publication."

Mrs. Dudeney's name has hitherto been connected with the presentation if not the solution of disagreeable social problems which, though not new in the history of humanity, have not always been considered desirable or even fit for discussion in fiction. 'The Story of Susan' is distinctly old-fashioned, for the scene is laid in an English village just when the young Princess Victoria had become Queen, and Susan's troubles spring from her adherence to the Church of England and reluctance to accept, along with the love of Martin Heritage, his serious views of life or to conform her conduct and dress to the taste of the elders of the Methodist Chapel. In their day, no doubt, the situation was full of agitating emotion, but the twentieth century looks calmly, a little contemptuously, back upon those conflicts of creeds that provided so much excitement for quiet communities in early Victorian days. In the case under consideration our sympathy is all with Susan, and, if the question of the value of a creed can be settled by observing its effect on character, the Established Church has here everything in its favor. Perhaps these controversies still linger in England, and Mrs. Dudeney may mean to prove conclusively the inefficiency of Nonconformist doctrines and practices to bring about either worldly happiness or spiritual tranquility.

Through all vicissitudes, the contrasting characters of Martin and Susan are well sustained, and the sincerity of their sentiment for each other is never in doubt. The society of Liddleshorn appears to be typical of the period, made up of people with few ideas, some strong convictions, and a gift of quaint, amusing expression. We are reminded of 'Cranford,' but by contrast, for the 'Cranford' people were delightful—a term not applicable to any inhabitant of Liddleshorn (except Susan) introduced by Mrs. Dudeney.

Mrs. Van Vorst's book is sub-entitled "A Novel of the American Woman of To-day." The great difficulty confronting the writer of a novel relating to a class is to avoid

the appearance of indicting a whole people. We have high authority for saying that this cannot be done. Its counterfeit presentment, in a novel with a purpose, can, more's the pity; to the detriment of perspective, proportion, and the novel. Mrs. Van Vorst's story arraigns the club-woman. The book reviewer may not decide on the usefulness of the institution in question or the desirability of the attack, but is within a reviewer's rights in remarking that Madeleine Dillon, in coming from her country home to New York, had an unfortunate experience in the club which she joined. It was a small, select Lunch Club, which is seen at the outset discussing with harmless irrelevancy and entire inanity a book studied for the occasion. At the end of the few months of Madeleine's sojourn in the city we find one member dead by suicide because she could neither marry nor renounce a married man; one suffering the loss of her only child because a too rigidly scientific bringing-up had depleted him to the point when he could not endure an operation for appendicitis. One has become a hopeless invalid through destroying her unborn child; one has equally become an invalid through shock at having wilfully speeded her automobile, injured the chauffeur, and killed her seatmate; one, a man-hater, is sentimentally nursing the chauffeur; one has obtained a first divorce and is on the high road to a second. Of all the club members there is but one without theories—theories embracing any eccentricity, from views on sterilized milk to plurality of husbands; and even she is the proud possessor of "a first unfortunate marriage which ended in divorce." Madeleine Dillon came, saw, was tempted, and overcame. She gathered up her bairns and returned with her husband to Pennsylvania, where they lived a life of happiness, feeding the children on cow's milk.

If this contention against clubs proves anything, it proves too much for human credulity. Its logic is like that of the spitter in a public conveyance who from his pool of tobacco roared to a remonstrant woman, "You'd ought to be at home washing your husband's dishes, that's where you'd ought to be." It is neither for nor against Mrs. Van Vorst's doctrine that the critic breaks silence. It is to point out that the voice of warning speaks most clearly in other form than that of fiction unless the writer have an exceptional gift for story-telling, added to a burning sense of purpose. In Mrs. Van Vorst's case, and in view of her earlier book of experiences as a factory-worker, it must be said that her facts preach better than her fiction. In showing forth certain feminine tendencies of the day she reduces them to a pulp of absurdity; nor is her own work free from a taint of the modernity that she deplores—a rending of the veil from life's mysteries in unsuitable places. Pathology to-day is in the parlor, psychics on the highway, reserves nowhere. As a novel, 'The Issues of Life' is amateurish, stiff, thin, full of puppets. As a plea against the new woman with her clubs, her views, her hobbies, her many husbands, her few children, it is overloaded by its own bias. None but a George Eliot could have made a successful story out of such didactic material. Can we imagine a George Eliot writing a story on these themes?

'To Windward' is crudely constructed too, and flounders about in a sea of unrelated, magnified, and non-natural incidents. And yet bracing salt breezes blow through one-half the book, and the other half is largely given to the always fascinating heroisms flourishing in a great city hospital. The author writes of seamanship like a seaman, of hospitals like a surgeon, of both with naturalness and fluency. It is in weaving the well-twisted threads into a fabric that his weakness is disclosed. No weakness, but a mighty pungency, characterizes the dialects of the deck and the sick ward. As good as a bucket of salt water over the head are Amos's exhortations to his unruly crew in words which can be described only as "langwidge." As a specimen may be quoted: *"B'low there!* Break out!! Up ye come—all hands!! I'll get down there among ye, and make ye think ye're back on a lime-juicin' wind-jammer, ye grimy sweeps!!!" No less forcible is the language of the doctor on shore when occasion requires, revealing a vocabulary which, with a robust realism, constitutes the author's strongest points. In his efforts to link his stories into a story he is less happy. As to characterization, his hero and the hero's patron, a gruff old surgeon, are not more overdone in faults and perfections than many other gentry of fiction, while several of the minor persons, who are hardly more than "single-speech" characters, are creditably life-like. But the women are less so, and the villain limps audibly as he passes from iniquity to iniquity.

'Susannah and One Other' opens in a refreshingly old-school atmosphere. There is a nice little child and a charming Aunt Sue, the heroine, who sings "Sally in our Alley" and "Believe me if all those endearing young charms." Love is the chief interest, lying the chief stumbling-block. The troubled soul rests for a season in the enjoyment of a thoroughly old-fashioned novel. Unfortunately, the end does not quite uphold the beginning. This is not because Brahms and the telephone creep into the Paradise; true, we were content without them, but they do not tarry. Rather is it that towards the last the construction sags. It is perhaps not more incident that one craves, but more relevancy of incident; more untying instead of mere lapsing of difficulties. The improbability of the leading complication—an engagement foisted on a man and a girl who have never met—is made agreeable if not plausible by the naïve and unsensational telling, while the development and progress of the story, though more probable, take less hold on conviction because of the slump in their gait. For three-quarters of the way it is a pretty tale, with the good old home comforts of English farm country, English house parties, love-making and fine-lady manœuvring. Who could help enjoying a certain garden of which it is said, "it had the look of being loved"? If in its last quarter the luminary wanes, at least it sets in peace—the peace that only an English country novel affords.

Frances Aymar Mathews's stories are singularly unequal. The Chinese ones have excellent points. Indeed, the first of them, 'The Little Tragedy of Tien-Tsin,' is a masterly compound of idyl and tragedy. The author writes with evident knowledge of the Chinese, and with sympathy all the more real because not blind. Her pictures of the women are especially engaging. That she understands the feminine Caucasian as well, appears in the description of an old English woman whose face was a "map of wrinkles." "It was the face of a woman, however; of that woman who is as old as Eve, and who will be with us until sex is no more; the woman whose life is summed up in the one word—anxiety." But the white stories as a whole halt—if not throughout, then in some important point; so that, in spite of much cleverness in conception and writing, a feeling of disappointment often attends the close. In one the disappointment arises from the absurdly affected language of a last-century masquerade. In another the legend of the Wandering Jew appears in a shape of banality. In a third, when a sister rescues an imbecile brother from drowning, she is made to survive, only to perish later in trying to save the same brother from fire—a survival that is fatal within the scope of the short story; in the union of flood to flame lies not strength, but weakness. The two Canadian stories are well done; preferable to the tragic one we find the comical adventure of the fifteen donkeys. The fantasy that shows us Shakspere making love to Amy Robsart's daughter at Kenilworth and that reveals her as the Lady of the Sonnets, suggests thoughts that lie almost too deep for tears—certainly too deep for words unless Dr. Furness kindly take notice and furnish them. On the whole, however, and taking one story with another, we may "admire piecemeal," as Meredith's heroine did on a certain occasion. In the matters of printing, binding, and colored frontispiece, the volume is one to be admired absolutely.

Abraham Lincoln and his Presidency. By Joseph H. Barrett, LL.D. 2 vols. Pp. 379-411. Cincinnati: The Robert Clarke Co.

A new Life of Lincoln has no reason for being unless it presents new facts, or new views of old facts, or a superior style of writing. Mr. Barrett's latest Life of Lincoln (he had written a previous one thirty-nine years ago) does not meet any of these requirements. A few letters from public men of the war period are presented for the first time, but they are of slight interest. The judgments pronounced by the author on the men and events of the period are scanty and inconsequential, and his style is tedious and in places obscure. Two personal interviews with Lincoln are narrated near the end of the second volume. Each of these contains a fact which we have not seen elsewhere. The first of these interviews took place October 2, 1864, and Mr. Barrett wrote his notes of it at that time. The Presidential election was approaching, the candidacy of Frémont had been withdrawn, Republican prospects were bright, and Mr. Lincoln was in good humor. Referring to the opposition of the Frémont platform to "arbitrary arrests," Mr. Lincoln related with merriment an incident that had lately occurred. "Frémont had sent me a verbal message," he said, "that if I would shut up his refractory 'New Nation' man in Fort Lafayette, he would balance accounts." Mr. Barrett omits, however, to tell us who the "New Nation" man was. The second interview is dated November 4, 1864. The fact of interest in it relates to the contemplated appointment of

Chase as Chief Justice. Mr. Lincoln had not yet made up his mind. There was a preponderance of opinion among Republicans, he said, in favor of Chase, but those opposed to him were too important to be wholly disregarded. "My old friend Dave Davis," he added, "on the Supreme Bench, would be displeased with Chase's appointment. He talked the matter over with me once last winter, and thought it not best to put a man on the bench who would still be aspiring to the Presidency." David Davis was a man of discernment, but if his criticism of Chase had been spoken in Chase's presence, the latter might have replied with much force, *Tu quoque.*

Mr. Barrett's literary defects are largely compensated by copious extracts from the writings of Lincoln himself, who assuredly ranks with the foremost masters of the mother tongue. Mr. Barrett quotes the London *Spectator* as saying: "No criticism of Mr. Lincoln can be in any sense adequate which does not deal with his astonishing power over words. It is not too much to say of him that he is among the greatest masters of prose ever produced by the English race." Abundant proof in support of this eulogium is supplied in these two volumes. The passages quoted are judiciously chosen, and, being arranged in conjunction with the events described, make a much stronger impression on the mind of the reader than the same passages when found in the 'Complete Writings.' We reproduce two of these by way of sample—the one for its almost startling force, the other for its bearing on present problems.

On the first of January, 1841, Mr. Lincoln, then in his thirty-second year, was under an engagement to meet Miss Mary Todd at a designated hour and place and be married to her. He failed to keep the appointment. He was married to her subsequently, but during the interval he went through such a season of remorse and self-reproach that his friend, Joshua Speed, feared he would commit suicide, and took precautions against it. In a letter to John T. Stuart, dated January 23, 1841, Lincoln said: "I am now the most miserable man living. *If what I feel were equally distributed to the whole human family, there would not be one cheerful face on the earth.*" Mr. Barrett thinks that Mr. Lincoln's failure to keep the engagement was unpardonable, unless "reasonably accounted for," but that, since Miss Todd afterwards renewed the engagement, "it must have been somehow explained to the person who had a right to know the reason." This is not quite so glaring a non-sequitur as that of Miss Tarbell, who argues that because she found several old ladies of the neighborhood, sixty years later, who did not remember the affair, therefore it never took place. The truth is that Lincoln felt such a sense of the wrong he had done to the lady, and such a resulting loss of self-respect and self-confidence on his own side, that he resolved to repair it by offering himself again, although, when asked by a little boy where he was going on the evening when he was actually married, Herndon says he replied, "To hell, I suppose."

The other quotation is from Lincoln's letter to Henry L. Pierce of Boston, dated April 6, 1859, in reply to an invitation to attend a festival in that city in commemoration of the birthday of Thomas Jefferson. This has been published often, but it seems to be quite as appropriate now as at the time of its first appearance:

"One would state with great confidence," says Lincoln, "that he could convince any sane child that the simpler propositions of Euclid are true; but, nevertheless, he would fail utterly with one who should deny the definitions and axioms. The principles of Jefferson are the definitions and axioms of free society. And yet they are denied and evaded with no small show of success. One dashingly calls them 'glittering generalities,' another calls them 'self-evident lies,' and others insidiously argue that they apply only to 'superior races.' . . . This is a world of compensations, and he who would *be* no slave must consent to *have* no slave. *Those who deny freedom to others deserve it not for themselves, and, under a just God, cannot long retain it.*"

How would those last words look in the Republican national platform this year, coupled with a refusal to give freedom to the "inferior races" on the other side of the Pacific, or to promise it to them at any future time?

At the end of so large a work as the one under review, fraught with the mightiest events in our history, the reader looks for a summing up of the character and achievements of the subject of the biography. Even this is wanting. In place of it we have a few brief appreciations by others, the most sententious of which is that of Sir Edward Malet, who held a subordinate place in the British Embassy at Washington in the war time, and who said of Lincoln, in a book published forty years later: "Of all the great men I have known, he is the one who has left on me the impression of a sterling man of God."

William Hickling Prescott. By Rollo Ogden. [American Men of Letters.] Boston: Houghton, Mifflin & Co. 1904.

Mr. Ogden's aim has been no more ambitious than to supplement Ticknor's standard Life of Prescott; having rather in mind to bring out the historian's personality than to judge his performance and rank as a writer. The result is a small volume furnishing agreeable reading for a couple of sittings, or even one. Prescott's journals and record of correspondence have been gleaned; the Harvard College Library has been interrogated for his reading while an undergraduate, and his "family room" (Hollis 11) has been identified; his letters and "noctographs" have been examined, the "occasional minor lapses" in his written Spanish remarked, Ticknor's liberties with Prescott's text when copying his English letters—"amusingly toned down, and now and then boldly altered"—pointed out; and especially a whole chapter reveals Prescott's political sympathies in a light which Ticknor naturally chose not to throw on them as not having (latterly, at least) the stamp of current Whig "respectability."

From all this it is impossible not to be drawn towards Prescott's simple and charming character, in accordance with unvarying tradition concerning him. His success, in copyrights as in reputation among scholars, is as romantic as his lifelong bearing-up against the great affliction of precarious eyesight. And here one might like to see brought out even more clearly Prescott's amazing quality of conscientiousness, which, when he was rich, social, not fond of work, and exempted by a cruel affliction from all call to work, led him to toil like a galley-slave, from a sheer sense of duty. On the other side—or should we not say on the same side?—is his curious methodical production, which permitted him to forecast the day and almost the hour when his task would be achieved; which was even gauged by formal written wagers with his secretary, the odds against himself, that so much would be accomplished in such a time and at such a rate. This measured flow at first seems opposed to the dignity of severe historical composition, whatever precedent may be found for it in the output of certain prolific novelists; but it meant simply the conscious control of materials finally amassed, and, for the rest, an added incentive to be diligent. If there was some pride in triumphing by the calendar, there was no self-complacency amid the applause bestowed on the grist of his mill. His modesty remained unaffected, nor was he capable of jealousy, while he could be frank in friendly criticism, as may be seen in the letter to Motley at page 212.

Some may be disposed to enter a caveat as regards Prescott's relations to Robertson. There is a significant entry culled by Mr. Ogden, at page 154, from the diary for April 23, 1845: "But beware of Robertson. Never glance at him till after subject moulded in my mind and thrown into language." In his "Conquests" Prescott inclines plainly to censure his Scottish predecessor almost without reserve, though his own books are hardly more than an aggravated amplification of portions of the 'History of America.' He had, of course, much more material at his command, but used it to much less advantage than Robertson did his limited material. Again, the systematic critical review of the sources, for which we are to a certain extent indebted to Prescott, is copied from Robertson, as well as from the Abbé Clavigero, Robertson's contemporary. The latter, in turn, derives much of his method and arrangement from Boturini. In a few instances Prescott praises Robertson indirectly. As for his own appreciations, they are the inevitable outcome of his time, of his lack of personal acquaintance with the countries and people, and his physical condition, for all which he is, of course, above reproach.

In connection with the wagers between Prescott and his secretary, already touched upon, his present biographer likens this "oddity" to a similar "sottise" on the part of Mme. de Sévigné. But the letter from which he quotes should be compared with preceding letters on the same subject, viz., the reading of La Calprenède's novel, 'Cléopâtre.' From these it will appear that though she had sworn to finish ("gagé d'achever") this novel, it was twelve-volume romances and not any "gageures" of her own that she considered to be "sottises."

There is a very pleasing portrait of Prescott for frontispiece, and an index. Sibley, Harvard's future librarian, as is shown at page 90, prepared the index to 'Ferdinand and Isabella' for $100; Folsom (p. 141) over-corrected the proofs of the 'Conquest of Mexico' for $50 a volume.

Pioneering in Central Africa. By Samuel P. Verner. Richmond: Presbyterian Commit-

tee of Publication. 1903. Illustrations and maps. Pp. xi., 500. 8vo.

The mission of which this book gives some account has the special interest that it was established in the Congo Free State to test the capability of the American negro for elevating his African brother, and it is manned chiefly by colored people from Mississippi, Virginia, and Alabama. It has borne the test successfully, judging from Mr. Verner's statement that "these Luebo people had become as civilized and more Christianized than the colored people of my own Columbia in five years' time." Of the individual work of the negro missionaries, men and women, by which in so short a time they had gathered in one town a church with 700 members, we regret to say we are told but little. The book is largely devoted to an account of the author's journey to and from his post, and his three years' residence as business manager of the mission and pioneer. The multiform character of a day's routine may be learned from his "labor programme for preaching, teaching, meditating, recording the results of linguistic study, overseeing the manual labor in garden, field, and building, inspecting and correcting the domestic and culinary departments, trading for native produce; keeping financial accounts of all transactions, receipts and expenditures; and receiving the constant stream of curious visitors (one of the most monotonous tasks after the novelty wears off)." His numerous pictures of the natives and their customs are interesting, but lack lifelikeness and variety, while he adds but little to our knowledge of racial characteristics.

His treatment of the delicate subject of the Congo Government is also disappointing. Naturally, in the interests of the mission, he would endeavor to refrain from writing so as to excite the ill-feeling of the Belgian officials, but he leans too far on the other side when he says that "the Congo is an instance of the policy of the open door," and that "the general effect of the Government has been progressive and beneficial." He acknowledges that "there are some flagrant abuses, but these are being corrected as rapidly as the conditions permit." It should be borne in mind that his mission was in the Kasai district, in which there have been, if we are not mistaken, few or none of the atrocities which have marked the Government's treatment of the natives in the northern and eastern districts. What this is can be gathered, however, from Mr. Verner's description of the manner in which the "Chef de Poste" collected the tribute of ivory and rubber in the mission town. His agents were a band of native soldiers, led by a native, and followed by a "vagabondish rabble of camp followers, thieves, rogues, rascals, runaway slaves, and idle riff-raff." At the first rumor of their coming the women and children hid in the depths of the forest—for "stealing women and children" was the aim of the camp followers—and the men prepared to fight. It was with the utmost difficulty that Mr. Verner prevented attempts to loot the town, which doubtless would have been successful but for the presence of the white missionary. This system of tax-collecting, however, does not seem to offend him as much as "the lack of any voice accorded the settlers, traders, missionaries and colonists in their government," for he writes at the close of his narrative: "One of the happiest events of my experience in Africa, and that which reflected most favorably upon the officials of the Government of the Congo Free State, was an act of the Government by which the white men at Luebo were given the right of local government, the administrative functions being vested in the ranking member of the American Mission."

The contributions to science are an account of some pygmy neighbors, a few specimens of the folk-lore stories "told to the enraptured little darkies gathered about the evening fires," and some facts in regard to the language, arts, industries, and superstitions of the people. There are also numerous hortatory passages, apparently taken from missionary addresses intended to awaken in American Christians a sense of their duty to their African brother.

We cannot forbear to note here that, in a letter to Lord Lansdowne describing his visit a year ago to the Upper Nile, Lord Cromer contrasts the condition of the districts under British rule with that of adjoining Congoland. In the former, "numerous villages are dotted along the banks of the river. The people, far from flying at the approach of white men, as was formerly the case, ran along the banks, making signs for the steamer to stop. . . . It was impossible to mistake their manifest signs and expressions of security and content." On the Belgian side of the river for eighty miles "not a sign of a village existed. Indeed, I do not think that any of our party saw a single human being in Belgian territory, except the Belgian officers and men, and the wives and children of the latter. . . . The reason of all this is obvious enough. The Belgians are disliked. The people fly from them, and it is no wonder they should do so, for I am informed that the soldiers are allowed full liberty to plunder, and that payments are rarely made for supplies. The British officers wander, practically alone, over most parts of the country, either on tours of inspection or on shooting expeditions. I understand that no Belgian officer can move outside the settlements without a strong guard."

The Chronicles of a Pioneer School from 1792 to 1833; Being the History of Miss Sarah Pierce and her Litchfield School. Compiled by Emily Noyes Vanderpoel. Printed by the University Press, Cambridge, Mass. 1903.

In the palmy days of its female academy, Litchfield was the fourth largest town in the State of Connecticut, a commercial and industrial centre. It now lies at the end of a small branch railroad, but about 1820, which is the *floruit* of the academy, all the post coaches on the main route from Boston to New York, or from Hartford to West Point, ran through Litchfield. Not far from Miss Pierce's school was the famous law school of Judge Reeve and Judge Gould, the first of its kind in the United States. A charming description of the town was written by Mrs. Stowe in 'Poganuc People.' In 1810 the Rev. Lyman Beecher had been called to the Congregational Church in Litchfield; the frequent entries in Miss Vanderpoel's record of the school testify to his interest in the enterprise. Henry Ward Beecher, his son, was born in Litchfield in 1813, and was prepared for college by Miss Pierce.

She was a pioneer of women's education. Not that the curriculum of the Female Academy, as it was always called, differed to any appreciable extent from that which, about the same time, at Miss Pinkerton's academy for young ladies on Chiswick Mall was fitting Miss Amelia Sedley to adorn her "polished and refined circle." Spelling and dancing, geography and deportment, with all kinds of embroidery and needlework, and the designing of elaborate colored historical charts were the leading studies at the academy. But Miss Pierce's theory of education was in advance of her practice and her times. Miss Pinkerton aimed at cultivating the manners of Amelia; Miss Pierce would have made a sincere attempt to discipline her mind by the practice of English composition and the study of that 'Universal History' which she wrote for the use of her pupils. Life at Miss Pierce's was a singular mixture of Arcadian simplicity and old-fashioned formality. There were no athletics for women in those days; when Miss Pinkerton's young ladies went boating, the students of the Law School took the oar; there was a daily walk, in which the start was made in a regular procession from the academy, to the music of the flute and flageolet, but the ranks quickly broke up, and the walk became a stroll in the society of the gentlemen of the law. The school record displays an innocent pride in the number of happy marriages that were the result of this association. The strangest phenomenon of all, from the point of view (say) of Miss Pinkerton, was the fact that the law students were not discouraged from playing "on their flutes under the window of each lady after they had retired"; Miss Pierce herself on one occasion was so enchanted with their performance that she composed some verses, quoted in the 'Chronicles,' complimenting the young men on their "heavenly music." She wrote plays which were acted by her scholars, with the assistance, of course, of the Law School; they are couched in excellent Johnsonese, and though the outward formalities were not maintained at Litchfield, we gather that the intercourse was conducted in language that Miss Pinkerton herself could not have surpassed. The diaries of the pupils reproduced in the 'Chronicles' are extremely amusing. One young lady, whose spelling and punctuation, like Miss Sedley's geography, "leaves something to be desired," writes in 1802:

"Arose at six devoted the morning to studying the boundarys on the map in the four noon worked a little time I went out to the barn with the girls to study my lesson came in and recited it took a lesson in music in the afternoon read worked on my picture studied my spellings and spelt after school the Boarders all moved the South Chamber and my time was spent in writing in graret and I was forgot and licked to lost my tea however I did not go up raret again without partisioning to some one to caul me meal times the evening was spent in reading till Nine and after that went down and went to Mr Chappins at get some beer."

Miss Sheldon, aged fifteen, records that "In the evening Mr Stanly was there, his manners are genteel and agreeable, but I am afraid that beneath a form so beautiful is concealed a vile heart."

The 465 pages of 'Chronicles' collected by Miss Vanderpoel and Miss Buel include

every scrap of available information bearing on the history of the academy itself, its teachers, and the 3,000 pupils who attended during the forty years of its existence. There is a good deal of repetition, and much that seems to us to have only the remotest bearing on the subject, though it has an antiquarian interest that redeems the irrelevancy. For instance, there are some fifty-five pages devoted to the letters and private accounts of Miss Pierce's brothers, Col. John Pierce (in which we note, by the way, that he paid thirty shillings for twenty-one pounds of sugar, and twenty shillings for a pound of tea) and Dr. Timothy Pierce. The numerous reproductions of samplers, water colors, and historical charts are a really charming record of a leisurely kind of education that has an archaic and even a melancholy interest in these days of basketball and college preparatory courses. Miss Pierce's Academy left its mark on some three thousand homes. Many an Amelia Sedley must have been braced by that influence, many a Becky Sharp softened and reclaimed.

Turkish Life in Town and Country. By Lucy M. J. Garnett. Illustrated. G. P. Putnam's Sons. 1904. Pp. viii., 336.

This is the latest issue in the series entitled "Our European Neighbors," edited by William Harbutt Dawson. Miss Garnett has spent many years in Turkey. She is modest and careful in her statements, does not exaggerate, does not profess to know what she does not know. She is also sympathetic with her subject, without being blinded to evil conditions by that sympathy. She recognizes the virtues and the vices of the various peoples and classes dealt with in this remarkably comprehensive little volume with astonishing impartiality. As a woman, she enjoyed opportunities of studying the home life of the Turk which a man does not enjoy. Her picture of the harem life of the Turkish women is much more favorable than that usually presented. Polygamy is the exception, not the rule; two wives, the second taken because of lack of children by the first, seems "to be the extreme limit nowadays, and only once during my long residence in different parts of the country had I the opportunity of visiting a harem containing more than one" (pp. 13, 14). Turkish women "already possess all the legal personal and proprietary rights necessary to give them a social position equal, if not superior, to that of European women generally" (p. 15). The objection to their emancipation from harem restraints is one of custom and prejudice rather than of religious law. One of the most serious difficulties in the way of that emancipation is, in Miss Garnett's opinion, the consequent abolition of domestic slavery. The conditions of that system of domestic slavery of females which seems to be an essential part of harem life, are, according to her representations, such that in many respects the lot of slave girls in Turkey is preferable to that of domestic servants in England.

Turkish official life she finds corrupt and inefficient to the core. Places are of necessity bought and sold. As salaries are insufficient, uncertain, and always in arrear, the officials must inevitably support themselves by extortion and corruption. Justice is administered in the courts in recognition of the best fee. Of the retrograde movement now going on in Turkey, one finds indications in various parts of this volume—the check put upon the introduction of Western products and Western thought, the increased distrust and dislike of the native Christian populations, the omnipresent espionage, the increasing interference with educational institutions and influences, including books, the press, and the stage, the growing burden of ill-adjusted taxation, falling with especial weight on the agricultural classes.

Peculiarly timely is the chapter on "The Macedonian Nationalities." A residence in Salonica and the neighborhood brought Miss Garnett in contact with representatives of these various nationalities; and, apparently, journeys into the interior enabled her to extend that knowledge. The information obtained through personal observation has been judiciously supplemented by inquiry and study, and one gains from this chapter an admirable conception of the characteristics of the various populations of Macedonia. Those parts of Turkey with which Miss Garnett seems to be especially familiar are Salonica, Constantinople, Smyrna, and the immediately adjacent regions. The Arabic-speaking portions of the Turkish Empire are not treated in this volume at all.

The book is pleasantly and simply written; the illustrations, if not new, are well chosen for their purpose, the volume is handy and pleasant to the eye. Unfortunately, Miss Garnett follows the French method of transliterating Oriental names, which, while presenting the sounds satisfactorily to French-speaking people, is cumbersome and occasionally misleading in English.

Samuel Pepys, Lover of Musique. By Sir Frederick Bridge. London: Smith, Elder & Co.; New York: Charles Scribner's Sons. 1903. Pp. x., 126.

No published diary has exactly the same stamp of candor as the diary of Samuel Pepys. Those who have written similar books, whether, as most of them do, they bury their worst sins and indiscretions under a discreet silence, or ostentatiously display them, like Rousseau and Restif de la Bretonne, all wrote for publication, or at least for a possible publication. Pepys has put such things into his diary as no man of his character can be conceived to have been likely to record if he had not felt sure that his privacy would be abundantly safe under the intricate cryptograph which he used. We have sometimes felt a certain sense of shame in reading these revelations, as if we were listening behind a door, or opening somebody's private letters. It is too evident that not a few readers of the Diary take a special interest in those confessions which Pepys must have written down in shame and confusion of face, while they peruse with indifference the record of his honest struggles for advancement in the public service, and the undesigned evidences of his good heart and kindly nature.

It is with unusual pleasure, therefore, that we take up this little book of Sir Frederick Bridge's, which deals with one of Pepys's most charming traits, his enthusiastic devotion to "Musique." Sir Frederick has written it *con amore*, as he does everything relating to that gentle art; and all those who like music will find it full of information and interest. Sir Frederick first shows from the Diary itself that Pepys deserves the name of musical enthusiast and was no mean critic of the art of his day. He then gives us two chapters on Pepys's musical contemporaries, Matthew Locke, the elder Purcell, and Henry Lawes, to whom Milton addressed one of his sonnets. Lawes was the author of a clever hoax at the expense of certain fops who affected to prefer songs with Italian words. He set to music the bare catalogue titles of a number of Italian songs with explanatory descriptions, and scored a decided success with these shallow critics. The words, translated, make such nonsense as this:

> "In that frozen heart for one
> Voice my Lady weeps
> If your eyes for two
> Voices, etc."

Other contemporaries named are Pelham Humphrey, Gibbons, Banister, and Monsieur Grabu, Master of the King's Music, panegyrized by Dryden, who wrote the libretto for his opera "Albion and Albanius."

We are next introduced to Pepys as a vocalist and as the music teacher of his wife and of several household servants, whose voices and musical taste were, in his eyes, quite as good recommendations as any more practical qualifications. In connection with Pepys's study of sundry instruments and criticisms on others, the author gives an instructive account of several which are now things of the past, the Lyra Viol, the Arched Viol, the Bandore, the Recorder, the Trumpet-Marine, and the Virginal, together with facsimiles of scores and tablatures for the "flagelet." The last chapter shows our diarist as a composer, and gives an account of his hard work on his two pieces, the basso song, "Beauty, retire," and the recitative, "It is decreed," the first of which is reproduced with the accompaniment. It is curious that this part of his musical activity brought him into serious trouble. In order to have near him an adviser in musical composition, Pepys had taken into his house and service a certain Morelli born in Flanders and bred at Rome. In 1679 this Morelli was accused of being a disguised Jesuit and plotting to dethrone the King. Pepys had enemies, who, on the ground of his connection with Morelli, secured his committal to the Tower in May of that year. He was eventually released on bail, but was careful not further to harbor the suspect.

This book is printed on excellent paper, with wide margins and good type. It has a sufficient index, and is adorned with a fine portrait of Pepys from the plate belonging to the Corporation of Trinity House.

The à Becketts of "Punch." Memories of Father and Sons. By Arthur William à Beckett. E. P. Dutton & Co. 1903.

"Three working journalists," the author calls his father and his father's two sons. From 1841 till 1902 their association with *Punch* was very close, and the present volume is a record of that association. The elder à Beckett—"à Beckett the Beak"—was the friend of Dickens and Thackeray, and the author of those immortal works the 'Comic Blackstone' and the 'Comic Histories' of England and Rome. It is

amusing to know that Arthur à Beckett, who revised the 'Comic Blackstone' after his father's death, had, by the advice of his coach, made use of that treatise in preparing for the bar. The sons' repute is eclipsed in that of the father, and one of the pleasant features of this volume is the fact that there is no trace of any desire to alter the true perspective. The author and his brother may be said to have continued the tradition of their father, but their humor was of a less marked variety.

The reminiscences here preserved are not as a rule of any general interest; the public at large has forgotten about the *Glowworm* and the *Tomahawk;* and even *Punch,* as it has grown older, has come to lack the importance it once had, when those who met once a week to talk over its cartoon were among the most original men in England. But there is a good deal that is entertaining, and we may put down as both entertaining and instructive the author's account of his adventures in court as editor of the *Glowworm.* A libel suit was brought by an actor, who asked for damages because it had been said of him that in Palgrave Simpson's "Watch-Cry" his part had been "efficiently spoken by the prompter." The case is a good illustration of the dangers of the law of libel in England, for not only did the actor recover damages in this suit, but managed to get damages twice. The editor, after the verdict, republished articles by other editors applauding the manly stand taken by him in defending the suit, as a result of which he was sued over again. What follows is curious. He discovered that there was a "speculative solicitor" who "saw his way to making an income out of every paper with which I was connected." This solicitor was at once secured by a general retainer to advise the editor, before publication, as to whether any contemplated publication was or was not libellous. He was never called on for an opinion; and there were no more libel suits.

Vacation Questions Answered

When planning your summer vacation, questions will arise which you can not answer readily.

We can tell you what you want to know about Colorado, Utah or California, the wonderful Yellowstone Park, the picturesque Black Hills of South Dakota, or the marvelous Puget Sound country.

It will be our pleasure, if you give us the opportunity, to tell you how to reach any of these points, how long it will take, what it will cost, what you can do and see when you get there, the cost of living, etc.

All these places are quickly and comfortably reached by the Burlington's thro' train and car service from Chicago and St. Louis. If you want to go somewhere for rest and recreation after visiting the World's Fair, write us.

Address the nearest representative of the Burlington Route, or use the following coupon, and the answer will reach you by return mail.

Important Announcement

Tanner's Elementary Algebra

By J. H. TANNER, Ph.D., Assistant Professor of Mathematics, Cornell University.

Price, $1.00

IN writing this book the author has aimed to make the transition from arithmetic to algebra easy and natural, to arouse and sustain the student's interest in the work, and to teach him to think clearly and to reason correctly. The exercises are numerous, well chosen, and carefully graded. Great care has also been given to the fundamental principles involved in algebraic processes. The book is designed to meet the most exacting entrance examination requirements of any college or university in this country, and especially the revised requirements of the College Entrance Board. The arrangement of the book will be found to be peculiarly suited to a briefer course where that may be desired.

The Nation

Was established in 1865 as a weekly review of literature, science, art, and politics, and its editorial management has been unchanged from the first. It is conducted in a spirit of complete independence. The list of contributors includes most of the leading names in literature, science, art, philosophy and law at home, and many of corresponding eminence abroad. THE NATION presents a complete and accurate record of the world's current history, with impartial comment on questions which would occupy the attention of intelligent men. To the scholar, the student, the thinker and to all professional men it is confidently recommended as an aid to sound thinking.

Subscription, $3.00 a year, post-paid. Shorter term at a proportionate rate.

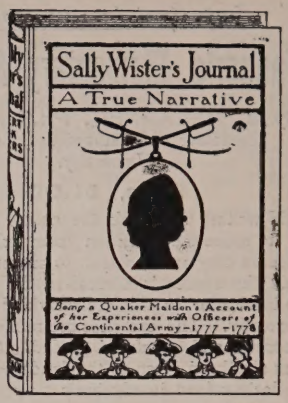
"Sally Wister is one of those charming maidens whose memory has been preserved,—like that of Dorothy Osborne or the Jessamy Bride,—by a fortunate accident. . . . We profess ourselves her devoted servants." THE ATHENÆUM (London).



Sally Wister's Journal
A True Narrative
Being a Quaker Maiden's Account of her Experiences with Officers of the Continental Army—1777-1778

Sally Wister's Journal

although a strictly historical document, is also a romance of unequaled charm. "The Journal has in many respects the attractions of a work of fiction. In fact, we have had considerable difficulty in persuading ourselves that we are not dealing with a wholly imaginative work. It throws many side lights upon the history of the times, giving interesting pictures of the society of the Revolution. . . . It is one of those books that one needs to read in order to get rid of the unreality that is apt to hang about the pages of history," says the Baltimore *Sun*. "A most delicious piece of literature," says the Philadelphia *Inquirer*. "The love-story is very pretty. This little scene has the color of an artist's interior,"—says the Hartford *Courant*.

SALLY WISTER, 16 years old, daughter of Daniel Wister, merchant, of Philadelphia, kept a journal of her experiences during the winter of 1777-1778, while exiled from Philadelphia during its occupation by the British. The family lived with relatives in an old farm house on the Wissahickon, which was occupied at times by various prominent officers of the Continental army. Sally saw much of the officers and heard much of the fighting, and comments on both freely and quaintly. Gen. Smallwood is "tall, portly, well-made: a truly martial air, the behaviour and manners of a gentleman"; Capt. Furnival, "the handsomest face I ever saw, a very fine person"; Captain Finley is "wretched ugly"; Maj. Stoddert, "very reserved" but has "an engaging countenance and address," etc. Later the Major grows much less reserved. Another officer who throws off his reserve is Capt. Alexander Spotswood Dandridge, of Virginia, a relative of Martha Washington. Sally calls him in the Journal "the handsomest man I ever beheld."

For a picture of this period from another standpoint read
"The Quakers in the Revolution"
By Isaac Sharpless, LL. D.
The second part of "A Quaker Experiment in Government."
12mo, cloth, $1.50.

Carefully edited from the original manuscript by Albert Cook Myers, M.L., who has collected a great mass of material elucidating the text, and also many portraits, relics, documents, signatures and pictures relating to characters appearing in the Journal. Beautifully printed on deckel-edge paper, profusely illustrated, and bound in antique style with a cover design by Walter Whitehead. **$2.00 postpaid.**

The Nation.

NEW YORK, THURSDAY, MAY 12, 1904.

The Week.

Ex-Gov. Black has now been officially chosen to make the speech placing Roosevelt in nomination at Chicago. Has the selection anything to do with a starchless civil service and the President's conversion to the system made famous by the ex-Governor? One might suspect so in view of the way in which Mr. Roosevelt is now throwing consular appointments to Quay. One of them is that of the discredited Saylor. When that product of Quay politics was first named consul at Dawson City by President Roosevelt, it was explained that the latter had been imposed upon. The thing was an accomplished fact before the President knew the man's record. But now he knows it, yet sends him to Coburg, Germany; and nothing but the efforts of Quay's other appointee in that country, Ambassador Tower, prevented the German Government from protesting against a consul of Saylor's character as *persona non grata!* Such a knuckling under to Quay, at the expense of the public service, is one of those mysterious lapses of a reform President which grieve his best friends, and which they can explain only on the ground that he cannot be a reformer again until "after the election."

Since Speaker Cannon said he wouldn't, the conviction has strengthened that Senator Fairbanks must take the nomination for the Vice-Presidency. The call for him will be intensified by the recent and remarkable Democratic gains in municipal elections in Indiana. That State will have to be "saved," and it throws a queer light upon Indiana politics that it is thought Fairbanks can to the saving. His is a "heavy respectability," of which the heaviness, at any rate, is undoubted. No public speaker can more quickly drive an audience to despair. It is true that he might successfully pose as the necessary antidote to Roosevelt—as a man without a spark of originality, and "safe" only because all his views are safely locked within his own bosom. His dread of even pretending to have a conviction is one of the standing jokes in Washington. On the other hand, the Vice-Presidential boom of J. A. Springer, president of the Cattlemen's Association, launched in the Colorado Convention on Thursday by ex-Senator Wolcott, has elements of strength, it seems to us, not found in any previous suggestions. The Republican party has in Mr. Roosevelt a candidate who owes much of his popularity in the Western States to his tremendous energy and his personal picturesqueness. Before a Western audience he can arouse enthusiasm as can few other campaigners. Yet considerations of propriety demand that he now remain at home, as McKinley did in 1900, receiving callers and reviewing an occasional parade, but not making stump speeches. The Vice-Presidential candidate must represent him on the hustings. Since he must send a substitute, why not send one as much like him as possible—a fellow Rough Rider? To put up Fairbanks for the active member of the ticket would be as unsuitable as for a theatrical manager, upon the indisposition of his swashbuckling hero of melodrama, to select as understudy the solemn and dignified player who is most at home in the rôle of the ghost in "Hamlet."

Prof. William James was one of the academic persons whom Secretary Taft bade for Heaven's sake keep silent on Philippine matters; but, in a public letter he has disobeyed the injunction. He asks if Secretary Taft is really an impartial judge of a condition that he himself has made. He is, "in the very nature of the case, bound, even though there were a flagrantly better possible alternative, to remain a passionate advocate of the system of which he is himself the author." Secretary Taft's scheme, pursues Professor James, is desperately Uptopian. To imagine that any nation is capable of determining precisely the kind and amount of liberty that is adapted to an alien race, is to enter upon an interminable calculus; while to execute such a policy would require officials "the offspring of a marriage between angels and steam engines." Phrases like "The Philippines for the Filipinos" mean nothing until they are supported by definite engagements. We are dallying with an issue as if we could conceal here a matter perfectly comprehended on the spot. "Benevolent drifting can hardly be more satisfactory than crafty drifting." So Professor James meets counsels of concealment, of procrastination; and, going behind the undoubted good will of Secretary Taft, he points to the real obstacle to the promises of independence—namely, the reluctance to give up power once seized. Sometimes academic persons see real issues rather more clearly than prejudiced philanthropists.

In five years the Philippines have imported $42,000,000 of rice, exclusive of freight, duty, and other charges. Hardly any rice, in fact, is grown in the islands, although it is the principal food of the natives and the Chinese. The most valuable lands for this kind of culture are lying fallow, while the Burmese growers are deriving a very tidy profit from the Philippines. This shocking state of affairs could easily be remedied. In the first place, the duty on rice is too low. The way to increase the supply and lower the price is to clap on a higher custom-house rate. That is what a committee which has been looking into the Philippine tariff question advises. But that is not all, for the committee also recommends that rice lands, and the animals needed to cultivate them, be exempted from taxation, and that the necessary machinery be allowed to come in duty free. What a fine chance for American capital! But is it quite certain that the Oriental mind will grasp the reasoning of the American protectionist? How can we make it plain to him that if we double the duty on rice, "this increase would not affect consumers," but would nevertheless "afford some protection to small growers, and might stimulate planting"? What keeps down the rice culture of the islands is the high price of labor, due to our exclusion of the Chinese. Let them in, say certain expatriated and recreant Americans, and rice growing will take care of itself. But to let an industry take care of itself is abominable!

The seventh annual conference for education in the South showed the hold which the educational movement is taking upon the people and the rapidity with which it is spreading. Beginning with the most thoughtful and liberal among Southern statesmen, it has already embraced the leaders in the larger communities, and has become so powerful as to demand consideration from politicians not wholly in sympathy with its objects. Besides educators and philanthropists, men with large commercial interests have been drawn to this work because they have seen a menace to industrial enterprises and business development in the illiteracy in the South, with its accompanying evils of violence and crime. Much is to be hoped from a movement which has enlisted the leading minds of an entire section of the country, so that all other questions of public policy take with them a secondary place; and which harmoniously unites such men as Gov. Montague of Virginia, Gov. Aycock of North Carolina, Gov. Jelks of Alabama, and Bishop Galloway of Mississippi, with educators like President Dabney of the University of Tennessee, President Alderman of Tulane University, President MacIver of the North Carolina State Normal School, Professor Mitchell of Richmond College—in fact, the chief men of all Southern institutions of learning of every class, and for both races. It is a great deal, too, when audiences composed chiefly of Southerners from States where negroes

are in a large numerical majority, will applaud to the echo such sentiments as Bishop Galloway expressed at the Birmingham conference—that negroes must be guaranteed the equal protection of the law, that "a white fiend is as much to be feared as a black brute," and that the majesty of the law must be sustained. Another element of hope is the growing spirit of recognition of the value of the training which negroes receive at Tuskegee and the industrial departments of Hampton. While the white sentiment in rural communities is still strong against the "educated nigger," it is gradually coming to recognize the industrial value of a trained workman, and this, in time, must lead to a recognition of the value of a trained brain to direct the trained hand.

This is a good time for everybody interested in wool to review the last seven years. Business is very dull in the market for the raw material, and as for the manufacturers, they are decidedly in the dumps. Shut-downs have already occurred among the mills, and others are threatened if trade does not improve. Part of this is due, of course, to general business conditions, but special causes have also been at work. It was intended that nobody should be treated more generously in the Dingley bill than the wool and woollen interests. But there seems to have been a blunder. Take the case of the dealers: They made large profits in 1897 by speculating in wool in advance of the tariff, but it is a question if the losses of 1898 were not of equal magnitude. The next people to take their profit from the new law were the manufacturers. But their joy was clouded when the growers, in their turn, began "to catch on." These have laughed last, and also best. Several years ago they succeeded in working up the price of their clips to figures which not only made it hard for the wool merchants to see a profit, but also forced the manufacturers to use cotton very heavily. Last year, wool sold in the West at figures equalling the seaboard prices, and this year the growers are asking fully as much—more in a good many cases. But from the very start the people have set their faces against advance in the price of clothing, and they are less disposed this year than ever to countenance it. With high-priced wool on one hand and short sales of goods on the other, the manufacturer must realize that things are seldom what they seem—especially tariffs.

The official report of the foreign trade of the Chinese Empire for 1902 throws a good deal of light on the causes of the depressed condition of the American cotton mills. Our exports of cotton cloths to China continue steadily to fall off. For March they were less than a quarter as large as last year. For the nine months since July 1, 1903, they were less than a third what they were the year before. Other exporting nations also fared badly, the Japanese mills being the only ones to increase their shipments to the Chinese markets. Strange as it may appear, in the Chinese trade report the imports of cotton goods for 1903 are figured at 128,620,004 taels, compared with 127,545,309 taels in 1902. But the case is quite different when they are reported by quantity. There were losses ranging from 11 per cent. in drills to 40 per cent. in American sheetings. Merely to state that cotton goods were higher in price does not make the situation plain. The annual trade statement of the Empire is interesting because it reveals why China cannot pay higher prices. Foreign trade in 1903 was disappointing; and it was particularly so in cotton goods. There were large stocks of these in importers' hands when the year began; the extreme fluctuations of exchange and the money stringency made the merchants slow to buy; the country was generally poor from the failure of the silk crop; and the indemnity payments, on account of the Boxer troubles, had a most oppressive effect on taxation. On top of all this came Mr. Sully's performances in the cotton market.

For several reasons, last week's sale of New York city bonds was of much importance. The city's credit was involved, since the average price brought by its 3½ per cents had fallen, within a year, from 104.29 to 100.10; and as the lower price was scored last March on the offer of only $3,000,000 bonds, some natural misgiving existed as to what rate could be commanded by the recent sale of $37,000,000. But beyond the problem of the city's credit lay the larger problem of the community's investing power. The financial phenomenon of the past eight months has been the action of great corporations, pressing their notes for discount at 5 and 6 per cent., in a total volume of not less than $150,000,000, because they could not find a market at former rates for their long-term bonds. This result has been variously ascribed to poverty of the investing public, to the rise in the general rate of interest, and to the mere fact that demands on the resources of the investment market had outrun supply. If any of these three explanations were correct, the bonds of New York city should have suffered along with new railway securities. It is therefore highly reassuring that the city's very large offer of new 3½ per cents should have resulted, first, in the loan being "covered" by bidders six times over, and, second, in an average price fully ⅞ of 1 per cent. above that secured in March. The price secured, ranging from 100.79 to 101.53, is low as compared with 1901 and 1902; but it is distinctly favorable as marking the first real change for the better since the general shrinkage of investment values began in the autumn of 1902. It also clearly signifies that watchful bankers have to some extent regained confidence in the investing public's power and willingness to absorb new issues of securities.

Mr. Cleveland's explanation in the *Saturday Evening Post* of the various circumstances which led up to the contract with the Belmont-Morgan syndicate in February, 1895, is interesting as showing his personal attitude towards the operation, after the lapse of years. That attitude was not left in doubt when uproar over the contract was at its loudest. In his message to Congress, in the following December, Mr. Cleveland affirmed, with characteristic bluntness, that he had "never had the slightest misgiving concerning the wisdom or propriety of this arrangement," and that he was "quite willing to answer for his full share of responsibility for its promotion." Furthermore, intelligent financial opinion long ago took the stand that the contract with the syndicate, costly as it unquestionably was to the Government, was at the time the only means of saving its credit to the Treasury and the gold standard to the country. What situation actually confronted the Government's finances may be judged by the fact that one of the organizers of the syndicate, barely a month before, had so far lost hope of preserving the currency standard that, at a bank directors' meeting, he voted to arrange for the formal opening of "gold accounts," as in the days of irredeemable paper money.

When, however, this is granted, two questions still remain in controversy. It is held by many critics that, had the Treasury been managed, twelve or sixteen months before, with the resolute courage shown in February, 1895, the crisis which led to the contract with the syndicate would never have arisen. It was the earlier hesitation in grappling with the difficulty which did the mischief. The second controverted point concerns the operations of the syndicate itself. It was formed to stop artificially gold exports which were draining the Treasury's reserve, and it was really for this service that the large indirect commission was allowed it. By a very unusual expedient—the banding together of the bankers in exchange, to draw on their European credits for supplying remittances which otherwise would have required gold exports—the syndicate's purpose was achieved during at least six months. The period of respite was important; it allayed existing panic, and it put the Treasury on

its feet again. But it was not a sound or permanent expedient, from a banking point of view. It was an effort to dam up the natural flow of international exchange, and it broke down completely in the end. It had, however, amply served its purpose as an emergency measure.

The Rev. Charles H. Parkhurst has done many things which require courage; but none requiring more than his defence of the higher criticism. This city has just witnessed the close of a singular conference—the Bible League Convention—the professed object of which is protection of the Bible against its trained students. Clergymen and laymen from all parts of the country protested against "assaults" on the Bible—that is, the publication of conclusions reached by many of the most highly trained experts in this country and Europe. This conference, we venture to say, has done more than any of the higher critics to shake the faith of men in the Bible as an infallible and inerrant revelation; for, as Dr. Parkhurst puts it, the addresses "left upon the minds of a good many sincere people the idea that there is a great amount of incompatibility between scholarship and Scripture; that there be certain things about the Bible which, if known, would be embarrassing to the faith; and that turning too much of that searchlight of investigation upon the foundations of Scripture would shake confidence in the stability of the foundations." One of the Bible defenders dwelt upon the "unparalleled danger" of the present attacks. Serious men may well ask with Dr. Parkhurst, "Danger of what?" The truth is not dangerous, and falsehood is certainly puny.

Professor Briggs's address on theological education frankly stated a truth which the friends of the ministry would do well to ponder seriously. It is that one reason why so few strong men are now being drawn to the ministry is that theological investigation is not allowed to be as free as all other graduate studies. In law, in medicine, in all branches of science, the young student knows that he may pursue his inquiries fearlessly, form his own convictions without let or hindrance, and be sure of a welcome for whatever truth he may be able to discover. It is only in theology that he is given to understand that he will depart from preëstablished views at his peril. This cannot but act as a deterrent to an ingenuous and eager mind. In many, of course, the unselfish and religious motives prevail, and lead to a calling where the opportunities for usefulness are so great, even with a good deal of mental galling. But the most conscientious and robust natures—men like Arthur Hugh Clough and Leslie Stephen—feel compelled to prefer intellectual freedom even to spiritual service. The repulsion of such men from the church, to which, at heart, they are so strongly attached, is one of the tragedies of our generation.

Mr. Balfour was asked recently in the House of Commons about the request of a deputation from Manchester that the Government should summon an international conference to consider what could be done for the manufacturers. His reply was far from hopeful. He said that the deputation had laid particular stress on the subject of dealing in "futures," and he questioned the propriety of calling a conference on that point, "because I doubt whether any good can be done by legislation." That doubt has confronted every one who has ever seriously tackled the problem. But if anything occurs to Mr. Balfour along other lines, he will do all he can to bring British manufacturers into accord with tnose of the Continent. Meanwhile, the mill owners are not waiting for the Government to take care of them. Their search for new cotton fields goes steadily on. The outlook, on the whole, is promising. During the cotton famine of 1861-1865, the English manufacturers were still able to utilize Indian cotton, but that is now unsuited to the British market. The question whether India can produce a longer staple is one which is exciting deep interest, both here and in the United Kingdom. The Blue Book recently issued on the cotton situation says that little extension of the industry can be looked for in Egypt, and is silent as regards the Sudan. The really promising regions are Africa and the West Indies, and possibly the Fijis, Borneo, and Cyprus.

In view of Russian reverses in the Far East, the disparity between the alleged terms of the new Russian and Japanese loans is very striking. The Czar's Government will, it is affirmed, place a $160,000,000 five-year 5 per cent. loan in Paris, and it is somewhat vaguely stated that the bonds "will sell between 98 and 98.50." Japan's new loan will be of $50,000,000. The bonds will carry 6 per cent., and will mature in seven years. The "issue price" will probably be 93½, and the bonds will be a first lien on the Japanese customs. Just what commissions the two Governments are to pay to the bankers is not known, but that is probably a minor factor in explaining the great difference in the credit of Russia and Japan. The fact is, France has invested such enormous amounts in Russia in the past that she is obliged to keep on doing so, whereas the financial interest of the outside world in Japan has been insignificant. Besides, the resources of the one country are better known than those of the other. That Japan has a remarkable future may be admitted, but it is not clear just what lines her industrial development will take. French investors can see at once the sources from which, in the event of the worst, they can make themselves whole. That is why they refused to sacrifice their holdings of Russian securities in the great break in the Paris market of February.

"There is nothing more dangerous in a Pope than piety," said Pére Hyacinthe of Pius X., and the famous preacher added, "when it is not supported by broad and independent knowledge." These just words apply very well to the Pope's protest against President Loubet's visit to the King of Italy. Theoretically, at least, his Holiness is right. For any Power maintaining diplomatic relations with the Holy See to send its representative to the Quirinal, neglecting the Vatican, is a slight. The King of England and the Kaiser always contrive to make both visits; the Emperor of Austria stays away because he fears to make both and will not make one. But the point is not that Pius X. has a grievance against France; it is rather that, having no effectual means of resenting the slight, he might wisely refrain from empty diplomatic protests. Such action will only embitter the anti-clerical feeling now dominant in French politics, and it may bring about harm to the Church much more substantial than any technical lack of courtesy to the Primate. Of course, the anti-religious propaganda now at its height has naturally been abhorrent to the head of the Church. But as a matter of fact, the comments of Pius X. on the French situation have greatly aided Premier Combes's Neojacobins. It has been a situation to test the skill of a political Pope, which Pius X. apparently is not.

Lord Curzon's spectacular trip about the Persian Gulf receives an interesting commentary in the latest trade figures from Persia. During the fiscal year 1902-3, Russia exported to Persia $11,500,000, receiving $12,300,000. Great Britain sent $10,200,000 to Persia, falling into second place, and imported only $1,800,000. On any theory of favorable trade balances, Great Britain should be enormously the gainer by so much cold cash, while Russia and Persia are foolishly taking each other's goods. But it is probable that even the ultra-protectionists of Downing Street take very little comfort in a balance attained by decreasing the total British trade with Persia to about half that of Russia. In this case trade figures are a fair index of political influence, and the British look rather foolish fighting the phantom of Russian aggression in Tibet, while Russia is steadily approaching the Persian Gulf by the irresistible processes of trade.

THE MANTCHURIAN CAMPAIGN.

The evacuation of Niu-Chwang leaves the Japanese masters of the southern coast, for the Port Arthur fleet lies blocked in harbor, and the fortress city is hopelessly cut off from reinforcements from the north. Its reduction appears to be only a matter of time. It is unlikely that its garrison of 22,000 souls can have supplies for many months, and a costly assault may be unnecessary. In any case, we have at this early stage in the war the Japanese in virtual possession of southern Mantchuria, and at less cost than ten years ago, when their foe was the despised Chinese.

Gen. Kuropatkin's withdrawal from Feng-Wang-Cheng, the position chosen by himself, indicates that there has never been an adequate army of defence at the south. It seems probable—is hinted in certain dispatches—that Gen. Kuroki with, say, 70,000 men is in superior force at all points of contact. When it is recalled that the War Office at St. Petersburg promised 400,000 troops by May 1, it is clear either that the promise was not made seriously, or that the transportation facilities have been fatally unequal to the demands of war. Possibly the original plan of defence trusted everything to the fleet. On any other theory it is difficult to account for the absence of an adequate garrison at Niu-Chwang, and for the smallness of Kuropatkin's force. The complete collapse of the Russian defence recalls French estimates made early in the war. It was then stated definitely that the Trans-Siberian could feed and supply about 225,000 soldiers, and no more. Recurring news of short rations at Harbin and Mukden supports this estimate strikingly, and the whole Mantchurian situation bears out those shrewd Russian observers in academic circles who have seen in the extension of the Empire its weakness.

As for the near future, the retreat upon the railroad at Hai-Cheng is probably only the preparatory step to a general retrograde movement to Liao-yang, or even to Mukden. At Hai-Cheng, Gen. Kuropatkin's communications would be seriously menaced by the Niu-Chwang expedition, which will naturally be the next stage of the Japanese advance. In fact, only some blunder on the Japanese part could prevent him from being caught between convergent attacks from the east, south, and west. It should be noted, too, that, with Niu-Chwang as a base of supplies, the Japanese line of communication will be short and easily guarded, so that, in abandoning Feng-Wang-Cheng, Kuropatkin is sacrificing the traditional advantages of a Russian retreat. It should be said, however, that the seizure of the Liao-tung peninsula throws back to the main army of defence a large body of railroad guards, and that, generally speaking, Kuropatkin gains numbers as he retreats. Whether this rather mournful advantage compensates for the loss of the seacoast is more than doubtful, for it is quite possible that the Japanese, once strongly entrenched in southern Mantchuria, will simply give the next move to the Russians. And if it has been impossible to maintain a successful defensive across Siberia, the difficulties of assuming the offensive may readily be imagined.

In passing, one or two novel features of the campaign should be touched upon, as well as the renewed talk about the Yellow Peril. Probably warfare has shown no such example of sheer dogged persistency as that displayed in blocking the Port Arthur channel. Attempt after attempt has been made by merchant vessels, supported only by the mosquito fleet, until the outer channel is strewn with perhaps a score of stone-laden hulks. Hobsons were found in plenty among a nation whose customs do not permit Hobsonian rewards. At first sight the expenditure for this end seems enormous, and yet the bottling of the Russian fleet was indispensable if great landing operations were to be conducted in the Liao-tung Gulf; and, after all, the hulks stranded in the Port Arthur roadstead may not together equal the price of a first-class cruiser. This brilliant manœuvre, then, was based upon that exact calculation of cost and adjustment of means to ends which we may regard as essentially characteristic of the Japanese temperament. Incidentally, it has added a new chapter of gallantry to naval annals.

Naturally, the startling apparition of Japan as a first-class military Power causes consternation among the prophets. The *Spectator* mutters dolorously of the Yellow Peril, which it consents more kindly to call "a very serious and momentous change in the balance of power in Asia." We, for our part, believing that the balance of power in Asia is essentially temporary and vicious, and that the greatest of the continents should learn to govern itself, have welcomed the emergence of Japan from mediævalism and would also welcome the rehabilitation of China. There can be no peril to the world at large simply because the yellow races are learning to fight for their undoubted rights. Peril to certain forms of commercial exploitation, peril to the notion that the yellow races have practically no rights, there is; we grant that freely. As for the dread that China under Japan's guidance will overrun the world, we have Professor Ladd's testimony—he knows the Japanese well—and we have common sense to tell us that this prospect is the most unsubstantial of bogeys.

COMMISSIONER WARE'S DEFENCE.

The Pension Commissioner petulantly threatened, not long ago, to have nothing to do with the newspapers if they did not leave off criticising him. This superior attitude towards the press on the part of a writer who once worked for it, is not uncommon. Mr. Ware, however, has so far got over his aversion as to write a letter to the *Sun* giving what must be taken as the Administration's official defence of the pension order. It is, in a word, that the offence has been condoned by Congress. The money was voted to carry out the order, and this, Mr. Ware argues, was equivalent to a vote that the order was "both wise and legal." And he adds that "the right of criticism ends at this point."

We must, nevertheless, point out, in the first place, that the Commissioner is wrong in his facts. What Congress did was to vote $1,500,000, in the form of a deficiency appropriation, to make good the increased estimate for pensions due to the order in question. That was, in effect, simply to say to the Commissioner of Pensions: "If you must have more money, here it is." Neither house of Congress, and neither party, is going to be put in the attitude of appearing less generous to the old soldier than is the President. But this was to admit nothing as to the real merits of the order. On that question, as Mr. Ware must know, the House—or, at any rate, the Republicans in the House—took an explicit and adverse position. Representative Moon offered an amendment to the Pension bill, incorporating into the act the exact wording of President Roosevelt's order. But it was ruled out on a point of order, and the Republicans voted solidly to sustain the chair. Now, what was the point of order? Why, that the amendment was "contrary to existing law." That was the real verdict of the Republican majority. It would give the money, but it would not declare the order of the President legal. In fact, it declared it contrary to the law.

But it would make no real difference if Congress had approved the order. That would simply show that Congress had abdicated where the President had usurped. Mr. Ware's argument is flimsy. We ask, "Where is the President's authority in law?" The answer is, "Why, Congress took it lying down." What has that got to do with the law? The facts are not as alleged in Commissioner Ware's defence, but if they were, the only inference would be that we were rapidly Mexicanizing our institutions. For the President to assume all power and for Congress meekly to endorse and validate all that he does, is the preferred method in Mexico. By it we have seen a military oligarchy establish itself under the form of a republic. Things have got to such a pass that the Mexican Congress frequently votes President Diaz a sort of blank warrant for all that he may care to do between sessions. That would please Commissioner Ware.

To his mind, it would legalize everything. According to him, the conclusive proof that an act is legal and Constitutional is, that "there is no kick coming" from Congress.

The truth is, of course, that there is no surer way of breaking down the Constitution than by getting Congress to wink at its violations. That is the historic method. In precisely that fashion did Bismarck set his military boot upon the Constitution of Prussia. He boldly spent money on the army without authority of law. Of course, he knew what he was doing. He did not conceal the fact that the King was imperilling the throne, and he himself his own head. But he had as much contempt for danger as he had for paper Constitutions, and went on with a stout heart in his illegal course. Could any subsequent validation of his acts have made them legal? The amiable Mr. Ware would say so, but imagine the scorn of Bismarck himself for any such contentions! He simply bared his sword and the lawyers had to stand aside.

We shall have no such overt and violent trampling on the laws by an American Executive, at least not for a long time; but the threat of radical departures from the old notion of strict conformity to law, and of clearly marked division of powers, lies distinctly in this Bismarckian, or Mexican, conception of doing whatever may be necessary and then getting Congress to add its *visé*. One hears an alarming amount of talk nowadays about written Constitutions having had their day; about musty forms of law no longer being worth considering by a strong ruler bent on doing something for the country's good; and about the people not really caring any more about legality so long as things are "done." That is Commissioner Ware's argument: if the President is not impeached, then *ipso facto* he is law-abiding. The statement sounds absurd, yet it is undoubtedly satisfactory to many people. They say that if Congress does not cry out, if the country is apathetic, it is foolish to appeal to the law. Whatever "goes," must be legal. This insidious plea is making too much progress in capturing the minds of the unthinking to allow such a hollow defence as that of Commissioner Ware's to go without protest. Congress must not be reduced to a mere Presidential echo. If it has no voice and will of its own, it merely cumbers the Capitol. Under the Pension Commissioner's theory of Congressional functions, all real power would be transferred to the other end of Pennsylvania Avenue. In that case, we should have to borrow the comment on the Swedish Church made in an old ecclesiastical dictionary. It was: "This Church has no bishops, but it has certain superintendent ministers who take it very kindly to be called so." Similarly we should have to say: "This country has no Congress, but it has certain validators of the President's acts who take it very kindly to be called so."

THE BATTLE OF THE REFEREES.

Many sinister rumors are flying about in regard to the bills to cure the scandalous law's delays in this city. Some of them are manifestly absurd. It is said, for example, that Gov. Odell will veto the bill for Supreme Court Commissioners because Mayor McClellan vetoed the bill for redistricting (and politically plundering) the municipal courts. We are not set for the defence of the Governor, but we refuse to believe him capable of openly making spoils of the judicial system. Nor can we credit the report that one Justice has said that he will appoint Commissioners as soon as he gets his "slate" from the Republican organization. All this is but a part of the attempt that is obviously making on a large scale to confuse the public mind and to hide the actual issues involved, as well as to keep in the background the real motives of the interested parties who are endeavoring to create misconceptions of the intent and effect of the bills in question.

A sufficient answer to nearly all the objections, now raised as if they were great novelties, is to be found in the report of the Commission on the Law's Delays. It is alleged, for example, that the plan received no consideration from the bar. But hundreds of members of the bar appeared before the Commission, or submitted their views to it in writing, and the Bar Association at a regular meeting directed its Judiciary Committee to look into the projects of the Commission. This was done, and the report of the Committee, dated March 28, 1904, by Judge Dillon, chairman, pronounced the plans "well considered and practicable." In like manner it is ignorantly charged that the proposed court commissioners would saddle an expense of $300,000 or more upon the city of New York. But the Commission's report conclusively shows that the supplanting of referees and condemnation commissioners would result in a large net saving. The Constitutional doubts so suddenly afflicting many of our newspaper jurists we cannot undertake to discuss; but it is laughably clear where most of them have their origin. Vested interests in patronage are at stake. Legal advertising and other perquisites are in the balance. A favored class sees its privileges imperilled. Certain corporations are interested in having the blockade of the courts continue. Hence the troubled dreams of our Constitutionalists of the press.

What we are really witnessing is a hoary abuse fighting against its own abolition. This is natural. It is something as old as reform. But why try to clothe it in the garb of pained Constitutional scruple—infringement upon the rights and the discretion of the judges? In its essence, it is a clinging to patronage, an obstinate resistance to doing away with the evils of our referee system. All referees are not to be indiscriminately classed as favorites or dividers of the spoils. Among them are men of the highest character and ability, most of whose references come to them at the request of the parties to the case. They are exactly of the type desired for court commissioners, and as such would be able, by the consent of litigants, to do much to clear the calendars. But they are not the ones who are stirring up the present row. That is promoted by patronage-mongers and sharers in the judicial spoils who, between them, have made our referee system the reproach it is—wasteful, dilatory, and politics-ridden.

Memories are so short that people have forgotten what abuses of the power to appoint referees were discovered in the days of Tweed. One of the grounds on which it was sought to impeach a judge of that time was that he habitually named a certain member of the bar as referee, who divided fees with him. The court lists to-day reveal ominous repetitions of suspicious names; and the scarcely concealed interchange of family courtesies between certain judges, in the matter of appointments of referees, has already approximated scandal. To show what political managers of either party think to be the chief end of referees—that class now held up to us as a sacred band, to lay a reforming hand upon which is sacrilege—turn back to Richard Croker's testimony before the Mazet Committee. He gave it as his matured and statesmanlike view that "in all matters of patronage the judges should consider the organization first." Then followed this colloquy:

"Q. Even in the appointment of referees? A. Yes, sir.

"Q. There are able, good Democratic lawyers in the city of New York? A. Yes, sir.

"Q. Enough to fill all the positions as referee? A. All the places.

"Q. And you think that the judges should appoint as referees men who are in line with the Tammany organization? A. All things being equal, they should. Yes, sir, they should give them the preference. . . ."

Let it be understood that this is the abuse which it is proposed to tear up by the roots. Let it be made clear that most of the opposition to this great reform—long under advisement, carefully wrought out, and now on the eve of coming into operation—is of an interested sort. What it really bespeaks is the alarm and anger of men who see plunder escaping them. The bills which the Governor is besought to veto aim at reforming a vicious system, and it cries out in pain. They aim at expediting justice, and those who see their account in retarding it go about artfully to befog the issue. That is, in fact, very simple. It is whether New York is to continue to

lie under the shame and to suffer the losses of a system which denies justice by delay, and to perpetuate iniquities of judicial patronage simply because the beneficiaries cry out that to take away their spoils is to violate the Constitution.

THE WESTERN UNION AND THE POOLROOMS.

President Robert C. Clowry's explanations of the complicity of the Western Union in the illegal poolroom business are not even ingenious. A committee of the City Club charged the officers of the Western Union Telegraph Company with wittingly supplying a poolroom with a special wire for illegal purposes, and promising to provide a "fly" operator who would know enough to "drop cut of the window" in case the place were raided. The accusation was specific as to names, dates, and places. The wires which were asked for were strung and run down a chimney, in order to attract less notice. Col. Clowry replies, first, that it is the legal duty of the telegraph company to "transmit all messages couched in decent language"; that it "has no right to be a censor of public or private morals." He adds that he is "quite ready to coöperate with the constituted authorities in their effort to suppress crime"; and that "whenever those charged with the enforcement of the law" furnish "in writing" the names of persons engaged in keeping unlawful poolrooms, and "specify the places," the company will on request "cease the transmission of intelligence to such places." In short, whenever one of Col. Clowry's subordinates is caught red-handed, Col. Clowry will obligingly see that he stops violating the law. However, being pressed, in answer to the question whether he will insist on complete legal evidence of the illegality of the supposed gambling resorts, he says: "If Police Commissioner McAdoo will send me a list of places which the police *suspect* to be poolrooms, I will have the wires taken out of those places." To this, Mr. McAdoo pungently replies that "the responsible men who have charge of the racing department of the Western Union Telegraph Company have a better opportunity to learn, and actually know, more about poolroom men and the poolroom business than any other people in New York." Their employees collect and turn in the tolls daily, including their own wages.

The president of the Western Union likens his company to a railway, which sells tickets to all who apply, without scrutinizing their motives or morals. To make the application: Suppose the head of a gang of burglars went to the general passenger agent of the Pennsylvania Railroad and said, "We intend to crack a safe in Princeton to-night at two o'clock. We want a special engine in order to get out of town quickly. The engine must be ready with steam up, on a siding behind a shed, at half-past two sharp. We want a 'fly' engineer who knows the business, who will rush her out the minute we get aboard, and who can keep his head if the police make trouble, and pull us through regardless." Suppose the general passenger agent courteously replied, "We understand exactly what you want. We will see that the engine is ready, that it is standing where it will not attract attention, and that you have an engineer who is expert in getting cracksmen safely out of town. We do not sign written contracts in these affairs, and the price of the service will be double; but this is a part of our regular trade, and we guarantee satisfaction." Suppose, also, that in accordance with this verbal agreement the engine were actually on the siding, with steam up, at the appointed time.

Suppose, then, that when the Pennsylvania was publicly accused by responsible people with knowingly and regularly furnishing a special train service for burglars, with deliberately acting as an acomplice in the trade of thieving, President Cassatt were gravely to give to the press a long statement in which he affirmed that the railway was not a censor of public morals; that it made no inquiry about people who bought tickets, if only they were decently clad and soberly behaved; that the railway provided special trains for all who could afford the price, without scrutinizing their motives; and that when the prosecuting attorneys or the police would give written information about intended robberies, and make due request, the Pennsylvania would refuse its Burglars' Special to the persons to whom objection was made. Were President Cassatt to utter any such pitiful, pettifogging plea, his family would not wait for the railway directors to demand his resignation, but would clap him into an insane asylum at once.

President Clowry's reply is a juggle; it confuses the ordinary business of the company with an extraordinary business, of extraordinary profit, for which extraordinary provision is made. Of course, the Western Union cannot scrutinize every message offered it, cannot require a certificate of character from every sender or receiver, cannot probe motives; but when men come to it and ask, explicitly or implicitly, "Will you help me break the law in Room 210 on the second floor of such a building on Broadway," it can lawfully refuse, without a special warning by the police. The ordinary citizen on the street would feel outraged if he were requested to become a partner in crime; but, according to the evidence presented to the City Club, President Clowry's subordinates accept complicity in the criminal poolrooms as a part of their daily occupation, and President Clowry complacently excuses them on the ground that they are not moral censors.

This is a moral question, a question of rudimentary decency and honesty. President Clowry must have singularly misjudged the ability of ordinary people to grasp an elementary proposition when he declared to a reporter of the *Herald*. "It is all nonsense to try to put this matter on a moral basis. The officials of the Western Union Telegraph Company are not moral censors, and the courts have held that they cannot take that position. The company has wares to sell, and any one who can pay for them can buy them, and he will not be asked to what church he belongs." This, of course, is infantile sophistry. No one cares to what church President Clowry and his subordinates belong; but every man in this country—even an official of the Western Union—ought to be a moral censor, if, as President Clowry implies, a moral censor is a person who possesses the negative virtue of refusing to be an accomplice in crime. Law-abiding men, lovers of decency and order, must evidently appeal from President Clowry to his superiors, the directors. Do men like Morris K. Jesup, Jacob H. Schiff, and James H. Hyde accept as a conclusive dismissal of the grave and detailed accusations President Clowry's general denial, "I do not believe any fair-minded person will suppose that the Western Union Telegraph Company would willingly become a party to any criminal undertaking"? Do the directors accept the proposition that, because the company is not a censor of morals, it is therefore at liberty to enter a conspiracy with criminals? If President Clowry really utters such a theory of recklessness and lawlessness for the conduct of a great corporation like the Western Union, neither directors nor stockholders need be astonished at popular clamor for a Government management of telegraphs that shall shut out thieves and swindlers as they are now excluded from the mails.

GOVERNMENT MORE COSTLY.

The April Treasury statement shows that Secretary Shaw's estimate of a $14,000,000 surplus for the present fiscal year is hardly likely to be verified. The surplus on May 1 was $2,458,572, leaving about $11,500,000 to be made up in the next two months. One instinctively asks what this signifies regarding the future. Secretary Shaw has come out on the right side, so far, in his estimates of revenue. His error was in the matter of expenditures, which to date have proportionately exceeded those of the previous fiscal year. Since Congress has allowed for a margin of only $6,000,000 over expenditures next year, the financial outlook for that period is shrouded in doubt. Paying for a big army and navy and great public works may

present problems of unexpected difficulty.

The British Government is now in a similar plight. The speeches called forth in Parliament by Mr. Austen Chamberlain's budget reveal a situation strikingly resembling ours. Sir Henry Campbell-Bannerman showed that the nation's expenditures had risen from £93,000,000 in 1895 to the £142,000,000 estimated for the coming fiscal year; that is, about 53 per cent. Going somewhat into particulars, Sir Henry pointed out that the amount spent on the navy increased from £9,400,000 in 1870 to £17,600,000 in 1895, the estimate for 1905 being £42,100,000. Between 1870 and 1890 our own disbursements for naval purposes averaged not far from $20,000,000 a year, but in the nineties a great stride forward was taken, and last December Secretary Shaw estimated them for 1905 at over $103,000,000. It is the same story with the army. The British expenditure on this account rose from £12,300,000 for 1870 to £18,700,000 for 1895, and to £32,500,000 for 1905. Proportionately, we have far outdistanced Great Britain since 1895. Our army expenses were about $51,000,000 at that time, but for 1905 the Treasury's estimate was over $126,000,000.

Thus in piping times of peace the Britsh Government, like our own, finds its expenditures on a war basis. But who is responsible, and what is the remedy? Both questions were discussed at great length in the budget speeches. One speaker inferentially charged that the whole thing was a plot of the protectionists. "The budget," he said, "was protectionist in spirit and intention; the same policy of piling up expenditure had been pursued in the United States in order to provide a secure basis for the schemes of the great American financiers." Sir Michael Hicks-Beach, on the other hand, believed no blame could be attached to any of the recent Chancellors of the Exchequer. Neither Mr. Austen Chamberlain nor Mr. Ritchie, his predecessor, created the expenditures. And as for himself, during his long administration of the office, he had repeatedly raised his voice in warning at the way the bills were running up. Sir Henry Fowler quoted Lord Beaconsfield's remark that "finance is a question of policy," and said that it was not the Chancellor of the Exchequer's place to settle the policy of the Government. In his opinion, the Prime Minister was responsible for the growing expenditures. The speeches as a whole brought out the fact that things have been about as much at sixes and sevens in Great Britain, in the matter of appropriating public money, as in this country.

But while it is easy to see causes of the present situation, it is difficult to find remedies. That the nation is spending too much money is obvious. The army and navy are making the taxpayers sweat, but what public men advocate measures that will curtail the outlay on them? Mr. Haldane called attention to the fact that local and imperial taxation amounts to £190,000,000, or 10 per cent. on the national income. He wanted a commission to report whether the taxes are being levied in a just fashion, but he spoke dejectedly regarding expenditures; it was no use having an inquiry on this subject, "because expenditure depended on policy." There is the rub. The policy—who can change that? Even so resourceful a man as Mr. Haldane could suggest only that an effort be made to persuade the great Powers to check naval expenditures.

The friends of protection are continually telling us that this is not a poor man's country, and that we can stand a good deal of taxation. Our British cousins should take refuge in that comfort also. Mr. Austen Chamberlain tells them that they must look not merely at the growth of expenditure, but also at the nature of the bills they are now paying; and they must remember, too, their increased capacity to bear taxation. If John Bull does that, he will see that, heavy as is his load, it is relatively no greater than that borne by those "who lived in the halcyon days of the sixties, when gentlemen opposite seemed to think all things went well." Possibly, however, he may be so thick-headed as to believe a 5 penny income tax preferable to one of 12 pence.

THE ITALIAN SOCIALISTS.

FLORENCE, April 24, 1904.

The importance of the Socialistic organization in the eyes of this nation may be deduced from the fact that, as soon as the Congress of Socialists, to be held in Bologna on the 8th of April, was announced, all the principal journals devoted a series of articles to the discussion of the history of Socialism in Italy; and that, during the sittings of the Congress, the ultra-monarchical *Nazione* of Florence and the *Giornale d'Italia* of Rome, relegating the Russo-Japanese war, the advent of the German Emperor, the preparation for the reception of Loubet, even the Nasi scandal and the report of the Benadir inquiry, to the third and fourth pages, gave up the entire first and often the second to the discussions of the congress, finishing up each day with a leading article on the chances of the prevalence now of this, now of that, party of Socialists. The special interest of the general public is explained by the widespread desire to ascertain which party would obtain the majority of votes—whether the evolutionists, headed by Turati and Bissolati, who maintain that the rights and liberties of the proletaries, the amelioration of their moral, mental, and physical conditions, can be secured only gradually, by successive substantial reforms, to be attained by working within the limits and by use of the instruments of the social structure as it exists to-day, by taking part in the communal, provincial, and State organizations, by availing of the assistance of other parties, by supporting a ministry inclined to concede or to adopt a proposed reform, would prevail; or whether the revolutionary party, which rejects all such instruments and sees no chance for the proletaries save in the destruction of all existing institutions, the total demolition of the capitalist and the *borghesia*, and the advent to power of the proletaries *en bloc*.

The ascendency of the revolutionists, though denounced in the last congress at Imola, has been virtually increasing since the direction of the party fell into the hands of Ferri, who succeeded Bissolati as editor of the *Avanti*, the daily organ of the Socialists in Rome. Not that Ferri has ever admitted himself to be an out-and-out revolutionist, as does Labriola; but his actions prove him to be so, and his influence on the masses, impatient through suffering and credulous through ignorance, has led them to distrust more and more the efforts of the reformers, to incline increasingly to violent measures, to reckless strikes, to impotent resistance resulting in bloodshed and arrests, and to increasing friction with the employers of labor—with the effect of diminishing sympathy for their sufferings on the part of individuals and classes hitherto inclined to assist them. Yet Ferri has never scored a success by his agitation. Moreover, during the "universal strike" at Rome he "sat upon the fence," whereas he might have prevented that disastrous and criminal struggle, detailed in a former letter to the *Nation*, which resulted in the demolition of its chief author, Parpagnoli.

The convocation of a congress earlier than had been intended was promoted by the chiefs of the extreme sections, and especially by the reformers; seeing that the indecision of the working-class and agricultural organizations, produced by the contending currents, paralyzed all attempts to carry out the reforms pronounced urgent and indispensable, and must in the end plunge the masses into anarchy. Ferri, when the congress was decided on, notified his adhesion if, as a preliminary, the absolute unity of the Socialistic party should be proclaimed, and a motion was presented at the opening of the congress. No! said the reformers. First let us state our intentions and programme clearly and sincerely; then if there be a possibility of working together on parallel lines towards the same goal, we shall gladly avoid an open and public rupture, which will, we are aware, dismay the uncultured masses. But if such proclamation of unity is to fetter our determined line of action, make us responsible for doctrines and deeds which we deny and deplore, then we shall choose separation as the least evil, convinced that our policy in action will bring over to our ranks many who now are wavering between that action and the unrealizable methods of the revolutionists (alias anarchists). The desire of the Reformists was that, after a simple declaration of the several methods of the two parties, each being left free to follow their separate paths, the congress would discuss the important questions proposed at Imola to be studied and reported on by special commissioners, viz., the railway problem (governmental or private ownership); the tributary problem; the abolition of the octroi or city tax on food; the substitution of a progressive income

tax; the amount of income to be exempted; labor contracts; the industrial and agricultural organizations; the attitude to be assumed towards the influx of congregationists expelled from France; the problem of primary and secondary education, the really popular school for the masses; the crusade against alcoholism; the attitude of Socialists towards freemasonry, etc. The reporters had performed their tasks conscientiously, and each argument was of importance to the working classes, but no time was found for the bare reading, still less for the discussion of the report; the whole of the four days being occupied with the speeches of the adherents of the extreme parties, and still more with the introduction of other two "tendencies" suggested by a Left Centre and a Right Centre, new "fences" constructed by Ferri.

After the unanimous election of Andrea Costa, the veteran Republican and sincere Socialist, and two vice-presidents, Bissolati was called upon to present the order of the day of the reformers (or Reformists, as they are called). It was brief and succinct:

"The Congress reaffirms the autonomy of the Socialists as the party of the proletary class, whose object is its redemption from the oppressive tyranny of capitalism; and that it will retain this character exclusively, whatever direction the bourgeois government may assume. It declares, moreover, that, while preserving this distinctive characteristic, it will lend its support to ministries which offer sufficient guarantees for the conquest by the proletaries of those reforms of which at a given moment they have the most urgent need. As to existing institutions, the Congress declares that the party will continue to work within and by means of them, reserving the right to work for their overthrow if and when they present themselves as an obstacle to the proletary revindication."

In his brief speech Bissolati referred to the demand of their adversaries that the party should clearly and decisively affirm its antimonarchical character, and propagate the conviction that proletary redemption and monarchy are irreconcilable; but the reformers had already declared not only that the finality of the proletary redemption could not be attained under a monarchy, but that not all the reforms proposed by the radicals in their Roman congress could be carried into execution (for example, the principle of eligibility to all the offices of state, including, of course, that of kingship).

The order of the day presented by Labriola in the name of the revolutionists was as follows:

"Reaffirming the permanent and intransigent revolutionary character of the party of the proletariat in opposition to the bourgeois state [the term *borghesia* now comprises all classes outside the proletary], the Congress declares that the transformation of the political organization of the proletariat into a parliamentary, opportunist, constitutional and possibly monarchical organization is a degeneration of the socialistic spirit, inconsistent with the spirit of class warfare, with the very essence of the conquest by the proletaries of the Government (*pubblici poteri*). Hence it repudiates collaboration with any other class—not only participation in any monarchical government, but also systematic support of any bourgeois government, whatsoever tendencies it may evince, even if reforms proposed may be partially useful to the working classes."

Then succeeded an explicit command to combat monarchy in all its manifestations, to pursue the propaganda against it among the masses. The congress was called upon to reaffirm its resolve to renounce none of its offensive and defensive weapons against the Government, reserving methods of violence in case of necessity.

The two orders of the day being put to the vote, that of Bissolati obtained a fourth more adhesions than that of Labriola, thus confirming the preponderance of the reforming over the revolutionary theories. Neither, however, having received the absolute majority of votes necessary, the orders of the day of the two Centres were submitted—Rigola's with a marked tendency towards the reformers, and Ferri's with a decided adhesion to the doctrines of the revolutionists save as to the use of violence; and the latter, after a debate in which Turati also spoke with severity and some sarcasm, carried off a quarter more votes than the former, and victory was proclaimed for the revolutionists.

The public discussion of the results of the congress continued with unabated vigor during the interval between its close and the arrival of Loubet; the revolutionists accentuating their refusal to coöperate with other classes by forbidding Socialists to participate even in the ballot between the republican and monarchical candidates for the vacant college of Forlì—thus securing the election of the monarchical candidate by eight votes—while the Reformists continue to form and to organize sectional and regional committees based on perfect autonomy, so that while all accept the fundamental doctrines of Socialism, Sardinian Socialists provide for the special needs of their province, even as do Milan, Bologna, etc., and all await the presentations of the new organic reforms promised by the Giolitti Ministry. The nominal victory is for Ferri, but the substantial results are for the Reformists, who, by working within and without Parliament for the maintenance of pacific organization, will support the Radicals, the Republicans, and the ministerial party in promoting and carrying into effect the urgent reforms which have hitherto been retarded. The organization of the southern provinces, which Zanardelli had so much at heart, will be seriously studied, and there seems some hope that more success will attend the efforts of the present Ministry than has even been attained by its predecessors. On this the heart of the King is bent, and he not only urges his Ministry on the reforming path, but separately and diligently studies each bill, each plan of reform, before giving his signature to any.

For the moment, every class of the whole country is rejoicing in the presence of the President of republican France. The welcome given to him is unanimous and enthusiastic, because, after the fall of the Second Empire and the withdrawal of French troops from Rome, there was no cause or reason for hostility between the two Latin races; and since the French republic has accentuated its opposition to any interference of the Church with the State, all possibility of assisting in the restoration of the temporal power is at an end. The rupture in commercial relations between the two countries was brought about suddenly and unjustifiably by the personal rule of Crispi. Zanardelli opposed it from the first moment. The young King has done everything to promote a return to a cordial understanding, and the renewal of commercial relations was the first fruits of his efforts. No direct political alliance, no military offensive policy, will be aimed at. The Triple Alliance remains intact, the presence of the Emperor of Germany in Italian waters proving the immense importance that he attaches to it. Naturally, the Pope and the Catholic party object to the enthusiastic welcome given by the entire Italian nation to the head of "a persecuting government"; but the present Pope, while forbidding Catholics in Rome to take part in the welcome, has also discountenanced any contrary demonstrations. He is not a political Pope; he certainly will not reopen a crusade for the recovery of the temporal power; he is sick to death of his enforced imprisonment, and if, without endangering the spiritual interests of the Church, he can find a "live and let live" solution, he will assuredly promote it.

On the whole, therefore, the Italian horizon is clear, its foreign relations satisfactory; hence fresh assurances are given for the unity of Italy making for the peace of Europe.

J. W. M.

MARSHAL DE LUXEMBOURG.—I.

PARIS, April 20, 1904.

M. Pierre de Ségur has published in succession two volumes on the Marshal de Luxembourg: 'La Jeunesse du Maréchal de Luxembourg,' 'Le Maréchal de Luxembourg et le Prince d'Orange.' He now gives us the conclusion of his biography under the title of 'Le Tapissier de Notre-Dame,' a title which requires explanation. Since the sixteenth century it has been the custom to hang in the vault of Notre-Dame the flags taken by the French armies. D'Aubigné tells us, in his memoirs, that the great Coligny, finding himself at Notre-Dame, showed La Damville the flags captured from the Huguenot army at Moncontour and said, "It is time to take these flags away and to replace them with more suitable ones"—meaning the flags which he expected would be taken from the Spanish armies. During the reign of Louis XIII., the flags of Casal, of Brisach, of Rocroy were hung in Notre-Dame. The flags of past victories used to be replaced by those of the most recent. There remain now very few of these ancient trophies. A flag from Rocroy is still preserved at Chantilly, in the great "Galerie des Batailles." Another is kept at Cluny, where it was sent by Viollet-le-Duc.

The name of "Tapissier de Notre-Dame" was given to the Marshal de Luxembourg, whose military career was exceedingly brilliant. In a first volume M. de Ségur has told us the beginning of it:

"If," he says, "the treaty of Nimeguen (August 10, 1678) can be said to have marked the climax of the glory and the power of the reign, a reflex of this halo falls on the great captain to whom the King owed a good part of the final triumph. As a general, nobody contested the first rank to Luxembourg; and even outside of this prestige, his illustrious birth, his superior mind, and even the fear which people felt of his terrible sarcasm—all united to give him at court a unique place, higher than any other. Even in public, his name was on all lips. His high feats in Holland, the sort of fanaticism which he inspired in his soldiers, the singularities of his physique and of his character, marked him for the curiosity of the crowd."

In his splendid domain at Ligny, in Lor-

raine, Luxembourg led a royal life; in Paris, in his great hôtel in the Rue St. Honoré, he kept a real court. His sister was the famous Duchess of Mecklenburg-Schwerin. There was a dark cloud in his clear sky. Louvois had become his enemy. This enmity was veiled, but all the more bitter. Louvois found an occasion to strike his adversary in the famous "Affair of the Poisons," which has lately been described with so many details by M. Funck-Brentano. "On this extraordinary affair," says M. de Ségur, "so dark and complicated, I do not hope to throw complete light; my ambition is only to trace its great lines."

After the execution of the too famous Marchioness of Brinvilliers everybody looked for her accomplices and imitators. Suspicion was the order of the day. Bussy-Rabutin writes in a letter of April 28, 1679: "A crowd of charlatans has been multiplying in the capital, often drawing to their haunts numerous and brilliant customers." A *chambre ardente* was appointed to make an inquest. It was composed of eight councillors of state and six assistants. The president of this special court of inquiry was Boucherat, who afterwards became chancellor. The famous La Reynie, who was so long the head of the police, was one of the two reporters. The inquiry was conducted with great secrecy. At first only very vulgar people were examined, but from the beginning the name of Luxembourg was pronounced. "*Vox populi*," says one of Bussy-Rabutin's correspondents, "has accused Luxembourg for eight months, and you know well that in this country [Burgundy] very ugly rumors have been abroad." The truth is, that Luxembourg was not liked personally; his private conduct was bad. His imagination drew him towards the occult science of alchemy. He mixed with very bad company, and kept near him a sort of buffoon, an adventurer, who had once been tried for making false money. This man, called François Bouchard, who had assumed the name of Viscount of Montemayor, amused Luxembourg. He also played the part of a spy, and helped his master in all sorts of intrigues. We must not be surprised to see an inveterate skeptic, a thorough "libertin," like Luxembourg, consulting Bouchard respecting the future. "Libertinage," which would nowadays be called free-thinking, was often associated in the seventeenth century with the grossest superstitions. Astrology was always in honor in the highest circles.

Luxembourg was very intimate, also, with a young relation of his, a Marquis de Fouquières, whom St. Simon paints thus: "He was a man of quality, of much wit, of great courage, to whom nobody denied great qualities as a soldier, but the most wicked man that lived under the sky." He speaks of his corrupt heart, of his perversity. Luxembourg made through him the acquaintance of the woman Vigoureux, a friend of the prisoner Voisin and of some other dangerous characters, and among others of a Marquise du Fonte, of the magician Lesage. The latter was examined by the commission of inquiry and the name of Luxembourg emerged. I cannot go into all the details of this examination and others; it is enough to say that Louvois had an interview with Luxembourg and proposed to him to leave France. The marshal boldly refused, and asked to be sent to the Bastille; he was treated there with great severity. No proof of any sort was found against Luxembourg, but Louvois persisted in keeping him at the Bastille on the plea of peculation and fabrication of false money. He expected that the woman Voisin would make new revelations. She was burned in the Place de Grève without having said a word which could implicate Luxembourg. Her silence gave courage to the friends of the marshal, and the Prince de Condé came forward, protesting the total innocence of his cousin. The mother, the sister, the wife of the prisoner, obtained an audience from Louis XIV., who received them kindly and told them to be patient.

Luxembourg was still detained, but no longer as an accomplice of the prisoners. After some new examinations of Lesage and others, he appeared in person before the *chambre ardente*. He said to the judges: "Gentlemen, I went voluntarily to the Bastille to justify myself against the false, horrible, and absurd accusations which have been made against me. If you find that I have not victoriously destroyed them, I have only one favor to ask: it is to make my bonds stronger, till the whole nation knows that I have never shown a weakness unworthy of a man of my rank towards the miserable people with whom I have been accused of being very closely united." After these words he returned at once to the Bastille. The judges unanimously pronounced his innocence. Luxembourg was not, however, allowed to reappear at court. He went into exile at Piney; he was not allowed even to come within twenty leagues of Paris. He affected to feel no irritation against Louvois, and to show indignation only against La Reynie.

The trial of Luxembourg became the subject of many clandestine pamphlets, especially in Holland. He was accused of holding communications with the devil. A sort of legend was created in Germany, in which Luxembourg appears as a Doctor Faust. At his château in Piney, Luxembourg was occupied with arranging his pecuniary affairs. He found himself in great difficulties, but was saved from them by the intervention of the Prince de Condé. Great efforts were made by his family and his friends to bring him back to court; the obstinate enmity of Louvois prevented their success. Madame de Montespan triumphed for a moment over Louvois, and Louis XIV. summoned Luxembourg to Versailles. "Sir," were the first words of the King, "we will not speak of the past. I will mark my belief in your good conduct by confiding my person to your hands." The King by these words alluded to the function of captain of the bodyguard, which the Marshal had to exercise six days after his return.

The whole court rushed to call on Luxembourg—Louvois, among others, who was very well received. The Marshal was appointed in September, 1688, governor of the Province of Champagne, and received the order of the Holy Spirit. When the coalition was reformed against France, in 1688, the Prince of Orange had become the King of Great Britain; Condé was dead; but Louvois, who was all-powerful, gave no command to Luxembourg and kept him in pompous inaction at Versailles. Necessity soon came to the help of the Marshal. At the end of 1689 the fortune of war had declared itself against the French arms; when the campaign of 1690 was beginning, the name of Luxembourg was on all lips, and Louis XIV. declared himself in his favor, and placed him at the head of the army of Flanders. Louis XIV. informed Luxembourg of his resolution. "Sir," he said to him at Versailles, "I confide in you, as you are fortunate." "Who would not be so," answered Luxembourg, "in the service of your Majesty?" At the same time, Marshal de Lorge replaced the incompetent Duras on the Rhine; Catinat was sent to the army of Italy; Lauzun was to lead an expedition to Ireland.

The campaign in Flanders began in May. The Marshal took leave of the King on the 11th, and marched in the direction of Brussels. William of Orange was still in London, Waldeck had the command in his place at Brussels. On the 29th of May the French vanguard arrived under the walls of Hal, a few leagues from Brussels. This little place was evacuated by the troops which occupied it. William heard the news on his arrival from England. Louvois sent the severest orders. He desired Luxembourg to destroy with mortars and guns charged with red-hot shot the ancient capital of Brabant. He wished to strike terror among the population of Flanders. Such were not the sentiments of Luxembourg. Speaking of these populations, he wrote: "They publish openly that they would like to be under the rule of the King"; and, in another letter: "As for myself, thinking that a bombardment is an evil for those who are subject to it, without any fruit for those who inflict it, I assure you that I should not heartily undertake the bombardment of Brussels. . . . I should do it only with the painful feeling that it would effect but little, and that meanwhile the Prince of Orange would make operations advantageous to himself and very detrimental to the service of his Majesty." After reading Luxembourg's dispatches, Louis XIV. revoked the severe instructions given by Louvois.

Correspondence.

ALL HEROES' DAY.

To the Editor of The Nation:

Sir: The question is often asked, "What national holidays are there in the United States?" The answer is that there are none, since none are appointed by the nation, though there are several holidays of really a national character, as being observed by all the States. The following days are kept without exception by the forty-five States and the District of Columbia: July 4, Thanksgiving, and Christmas. February 22 is kept by all, if I am correctly informed, with the exception of Mississippi. January 1 is a holiday except in Massachusetts and New Hampshire. Also, some day of memorial for the soldiers of the civil war has probably universal observance. In the North, May 30 is fixed for Memorial Day, but in the South, where the season is earlier, April 26 or a date even earlier is assigned.

There are thus six days of practically national character—New Year's Day, Washington's Birthday, Memorial Day, Independence Day, Thanksgiving, and Christmas. The recent fall holiday, the first Monday in September (often called Labor Day), has been quickly adopted by all except Vermont,

Louisiana, Mississippi, Arkansas, Nevada, and North Dakota.

From time to time new holidays are suggested in honor of great national heroes. Lincoln's birthday is now observed by the following States: Connecticut, New York, New Jersey, Pennsylvania, Illinois, North Dakota, Wyoming, and Washington. But February 12 is too near February 22 for the day to become popular. Several of the Southern States observe January 19, the birthday of their noble leader, Gen. Robert E. Lee. In the first fervor of sympathy in the brave death of President McKinley, his birthday, January 29, was suggested for national observance. That of Gen. Grant, April 27, has also been proposed.

It is evident, however, that we cannot multiply our holidays indefinitely, and that the accidental date of a great man's birth may be a very inconvenient time for celebrating his achievements. Why should not one day of general observance be adopted, to be called, perhaps, All Patriots' Day, or All Heroes' Day? The Church long since found this solution of the problem of commemorating her numerous worthies. There were not days enough in the calendar for all, but the general festival of All Saints' Day (November 1) suffered none to be omitted.

An All Heroes' Day would permit every State and community to pay fitting honors to its own worthies as well as to men and women of national reputation. By the cooperation of the school and the press from year to year, different patriots, writers, inventors—all who have helped the common welfare—might receive that commemoration, not which their lives need, but which an intelligent and grateful people need to give to the makers of their history. As there are now no holidays between the first Monday in September and the last Thursday in November, a convenient date would be the Monday nearest to the fifteenth of October.

Some suggestion like the one here outlined has presumably been made before this, but none has come to my notice. A move in this direction is the "Patriots' Day" observed of late in Massachusetts on April 19, the anniversary of the battles of Lexington and Concord, but this is naturally a commemoration of the Revolutionary heroes alone.—Truly yours,

FRANCIS LESEARE PALMER.

STILLWATER, MINN., May 5, 1904.

[We print this for the information it contains (though we do not vouch for it), but we cannot profess sympathy with the proposal, even as a check to the absurd and mischievous multiplication of holidays. The moral significance (witness Memorial Day) would be quickly lost in a holiday pure and simple; and spare us more empty names and forms from which the spirit has gone out. We have annual exemplification of the complete failure of those who celebrate in speeches Grant's and Lincoln's birthdays, or Forefathers' Day, to understand the true greatness of the men commemorated.—ED. NATION.]

THE GERMAN WOMAN.

TO THE EDITOR OF THE NATION:

SIR: The diagnoses of the mental and emotional equipment of German women revealed in Christine Ladd Franklin's letter, published in this week's *Nation*, are not prejudiced so much by no knowledge at all of German women, as they are by an utter ignorance of the "large average of the population." She professes to have known many German women of the utmost culture and charm. Any nation that can produce many women of the "utmost culture and charm" is certainly not in danger of impeding the "onward march of women towards the ideal"; and this numerical testimony should be sufficient to save any country from being accused of producing, even "in the large average of the population," a class of women who have nothing better to recommend them to the men of a leading nation than "stolidity."

I am an American, born of German parents. I have been brought in contact with many German women in this country who were and are not "women of the utmost culture," but many of them were charming, and the very smallest minority of them were stolid. The women I have a personal knowledge of, with whom I became acquainted while studying in Germany, besides my aunts and cousins there, are the wives and daughters of farmers, mechanics, merchants, teachers, professors, clergymen, and professional men, and certainly none of them are stolid, stupid, or cowardly. They compare very well with the same class of women of Irish, or American, or English, or Scotch parentage in this country.

It seems a little puzzling to me for an American lady to say: "It is fine when a German man defends his fellow-country-women against the charge of stolidity." Why so? Germany is quite as civilized a place as France, England, or America; and German men love and honor their women at least as much as men of other nations do.

What are "the highest forms of civilization" in so far as the "ideal development of men and women" are concerned? Is it femininity? German women with German men say, No! Are they stolid on that account? Princess Bismarck was a typical German woman and mother. She was not stolid. There are many like her in the Fatherland. There are many like her in this country. If to understand and comfort their men be stolidity, let's thank God that German women are stolid.

Very respectfully yours,

DR. ADOLPH RUPP.

NEW YORK, May 5, 1904.

AN EARLY AMERICAN MUSIC STORE.

TO THE EDITOR OF THE NATION:

SIR: In his notice of Mr. Elson's 'History of American Music,' your reviewer repeated after him: "There were no music stores before the nineteenth century" (*Nation*, April 7, p. 276). The following extract is part of an advertisement which appeared in the *Maryland Journal* of August 6, 1794, No. 1725 (p. 3/2):

"*Musical Repository, Market-Street, near Gay-Street, Baltimore.* J. CARR, *Music Importer*, LATELY FROM LONDON, *Respectfully informs the public that he has opened a Store entirely in the Musical line, and has for SALE*, Finger and barrel organs, double and single key'd harpsichords, piano forte and common guitars."

ALBERT MATTHEWS.

BOSTON, May 6, 1904.

SHAKSPERE'S SEABOARD OF BOHEMIA.

TO THE EDITOR OF THE NATION:

SIR: For three centuries the learned and unlearned have been puzzling or chuckling over the coast of Bohemia in the "Winter's Tale." May I venture to offer a possible simple explanation of Shakspere's apparent ignorance?

When he wrote the play (probably in 1610-11), the Holy Roman Emperor Rudolph II. was just approaching the end of his long reign. In 1609 he had been forced to grant to his Bohemian Protestant subjects the famous "Majestätsbrief," or Edict of Toleration—an event which must have stirred Protestant England. It is inconceivable that Shakspere could have been ignorant of these happenings in Bohemia. The importance of the rôle that Bohemia was playing at the time must have been as patent to him as it was, to say the least, to the average educated Englishman. The Austrian realm under the Hapsburgs extended from Brandenburg on the north to the Adriatic on the south, and from Alsace on the west to Upper Hungary on the east, the centre of Hungary being then in the hands of the Turks. The largest constituent of the monarchy was the Kingdom of Bohemia, the so-called realm of St. Wenceslas, which, in addition to Bohemia, embraced Silesia, Moravia, and Lusatia. Rudolph II., the head of the house of Austria in Shakspere's time, during the greater part of his reign held his court, which was graced by the presence of such men as Kepler and Tycho Brahe, and famed throughout Europe, at Prague, the Bohemian capital. Is it, then, at all surprising that Shakspere did not discriminate sharply between Austria and Bohemia, and in a general way substituted Bohemia for Austria? As an analogy, the house of Savoy figured from 1720 down to 1860 as the Kingdom of Sardinia, although the island of Sardinia was but a comparatively insignificant part of it.

Supposing that Shakspere had said that the Mediterranean washed the shores of Castile, would literary historians have accused him of the same ignorance of geography which has so long been unjustly laid to his charge? While it is true that scene iii. of act iii. is specifically laid in "Bohemia: A desert country near the sea," throughout the play "Bohemia" is used indiscriminately for the country and its ruler ("the King of Sicilia means to pay Bohemia the visitation which he justly owes him," act i., scene i., etc.). Do not, at the present day, French and, for that matter, American journalists speak of the Prussians when they really mean the Germans? And how about Flanders? Is not the name of this small region used by historians for the Low Countries in general? And how about Burgundy? Supposing Shakspere had taken Charles the Bold of Burgundy as the hero of a tragedy, would he have been held up to ridicule if he had chosen to speak of the North Sea as washing the shores of Burgundy, meaning thereby the coast of Flanders and Holland?

Amid the mass of conjectures as to Shakspere's meaning, referred to by Furness, it is curious to find one, from the *Monthly Magazine* of January, 1811, which argues that there was "no breach of geography," in the following manner:

"In the year 1270 the provinces of Styria and Carniola were dependent on the crown of Bohemia. Rudolph, who became King of the Romans in 1273, took these provinces from Ottokar, the King of Bohemia, and attached them to the possessions of the house of Austria. The dependencies of a large empire are often denominated from the seat of Government; so that a vessel sailing to Aquileia or Trieste might, in the middle of the thirteenth century, be correctly described as bound for Bohemia."

Now, the memory of this ephemeral union of the thirteenth century (it lasted barely twenty-five years) could not possibly have lingered in the England of Shakspere's time, and it is really surprising that the ingenuity of the only commentator who appears to have been on the right track stopped short at this approximation to what would seem to be the rightful explanation. Dr. Furness himself, by the way, in the preface to his edition of the "Winter's Tale," rather singularly remarks: "Sicilia is Sicilia and Bohemia is Bohemia; and the one is no more on the mainland than the other is on the seacoast"; apparently forgetting that, for centuries before Shakspere's time, the southern part of the Italian mainland had come to be known as "Sicily on this side of the Faro" (the Strait of Messina), whence arose the designation of the Kingdom of the Two Sicilies. Most likely the great Shakspere scholar had in mind the island of Sicily itself; but in any case his phrase goes to show that geographical terms are used loosely to-day just as they were in Shakspere's time. X.

Notes.

Jacques Rosenthal, 10 Karl Strasse, Munich, will shortly issue Part I. of a Supplement to Hain and Copinger's 'Repertorium Bibliographicum' of incunabula. This section alone will contain more than 400 items unknown to these editors, together with many corrections and annotations. The second part will follow in the course of three or four months. The edition will be limited, yet the price is moderate. Prof. Dr. Dietrich Reichling has it in charge.

Harper & Bros. announce 'The First of Empires: "Babylon of the Bible" in the Light of Latest Research,' by W. St. Chad Boscawen; and 'The Gems of the East,' viz., the Malay Archipelago, by A. Henry Savage Landor.

Brentano's will publish directly G. Bernard Shaw's 'Man and Superman'; 'How to Illustrate,' by Charles Hope Provost; and 'Tristan and Isolde,' a tragedy in five acts, by Louis Kaufman Anspacher.

Even the 'Statesman's Year-book' (Macmillan) has been drawn into the politico-financial vortex in Great Britain. The current issue opens with a series of tables, maps and diagrams intended to show without bias "the conditions of British trade and shipping from 1860 down to the present date." Another novelty is the assignment of Panama to a separate place as a world-power. One naturally turns to the chapter on Japan, with its sub-section "Defence," but here the data for the Imperial army are no later than December 31, 1900. "The strength of the navy," we read, "lies in its homogeneous armored ships backed up by a large destroyer flotilla"; and Japan is now building her own protected cruisers and destroyers, and will soon be able to construct battleships. A footnote on page 1053 records the fate of the *Retvisan* and the *Tsesarevitch*, torpedoed on February 8. This, we believe, is the only echo of the great duel now in progress in the Far East. For the rest, this standard book of reference maintains its character for usefulness and authority.

The fourth volume of "The Works of Charles and Mary Lamb," edited by E. V. Lucas (G. P. Putnam's Sons), contains the 'Specimens of English Dramatic Poets,' first published in 1808, a work which opened the eyes of a public to whom the Elizabethan drama meant little more than Shakspere and Jonson, to the existence of unsuspected mines of poetic jewels. The editor has included Lamb's extracts from old and rare plays preserved in the Garrick collection, and has enriched the handsome volume with notes and an index, both excellent.

'Getting Acquainted with the Trees,' by J. Horace McFarland (The Outlook Co.), gives to lovers of woody plants a good deal of chatty information. The book has been prepared by the author on account of a sincere desire that others, wearied by business cares, should derive from trees the rest and comfort which have come to him through woodland walks. The desultory papers do not lay claim to much scientific or systematic lore, for, if they did, they would fail in that which imparts to them a value to the tired merchant or, as in this case, tired publisher. Trees in books come next to trees in being, in regard to the pleasure they give—provided always that the trees in books are not treated too learnedly or exhaustively.

Photographic processes for the production of engravings, either in black or in colors, have arrived at a great degree of perfection. Grace Greylock Niles, author of 'Bog-trotting for Orchids' (Putnams), has selected excellent subjects for engravings, and has secured good results. Here and there the outline is too obscure, as in the case of the apple-blossoms and one or two more, and the colors are hardly fair in all instances to the plants they portray. In the interesting sketches of excursions in search of orchids, the author introduces a great deal of trustworthy information relative to other plants in the path. The material has been some time in accumulating, and it has been subjected to pretty careful revision before reaching its final form. One could ask for a more consistent nomenclature in the treatise, but these are wilful days in the matter of plant names, and it is only right that each writer should do as he or she pleases, if good vernacular names are placed by the side of the new Latin ones. The writer has made an exceedingly useful and attractive book, which will lead, or at least ought to lead, many to examine our beautiful wild orchids in their swamp fastnesses. We count it a definite gain to nature study to have a book like this placed within easy reach of summer idlers and of summer students.

In 'The Heather in Lore, Lyric, and Lay' (New York: A. T. De La Mare Co.), Mr. Alexander Wallace has gathered together nearly everything he could lay his hands on in regard to Scotch heather. The comparative rarity of heather in the United States strikes every Scotchman as a fault of no small magnitude. Why we should have no moors is, indeed, a question hard to answer. At Tewksbury and Townsend, Mass., and at a few other places, a little patch of heather comes to view and holds its own for a while, as if it meant to stay. But there are no "heaths," no wide moors covered with strong and vigorous heather. There are certain plants, notably *Hudsonia*, wonderfully like heather, and these, simulating the heather shape and habit, are our only substitute for the pretty Scotch plant. Of late years, a new chapter has been slowly adding itself to botanical literature, under the name œcology. This is defined as the study of all the relations of plants to their surroundings in the widest sense of the term. Climate, soil, competing plants, both kindred and alien, animals of all sorts, favoring and hostile, and, in short, everything which affects the plant, must be examined in this new branch of botany. It is to this new and important division of the subject that all such puzzles as the lack of heather here are referred. And, thus far, the answer has not been satisfactorily given.

In 'A Norwegian Ramble' (Putnams), one of a party that made an interesting carriole trip in southwestern Norway, endeavors to suggest to lovers of natural scenery who take their vacations for rest, the many attractions offered by that picturesque region. They crossed the country twice from Christiania, once northwest to Molde, their furthest point north; then in and out of the wonderful fiords down the coast, and again southeast through the Valders to the capital. In the opinion of the author, the traveller may find on such a trip the most interesting and beautiful scenery, and a kindly, hospitable, and honest population, tempered by the worst cigars in the world. The book is a trifle, but is pleasant reading, and contains a few very characteristic illustrations of the scenery from photographs by the author.

The number of really meritorious treatises on political economy is becoming so large as to make it impracticable to review them at length. 'Economic Principles,' by A. W. Flux (London: Methuen & Co.), would formerly have been regarded as a work of enough distinction to deserve extended notice; but we have to speak of it only as one of a class. Its most striking peculiarity is that it makes hardly any reference to the writers on economics. This omission certainly results in a freer treatment and a smoother style, and, for an introductory study, such as this professes to be, the advantages may outweigh the objections. Another commendable feature is the relegation of all mathematical demonstrations of economic principles to the appendix, where they are out of the way of those to whom they might be a stumbling-block. Many of the treatises now published contain such quantities of what can only be called economic gossip and professorial opinion as to make it refreshing to meet with a book of which sound reasoning is the distinctive feature. Nothing is here asserted, we may say, that is not proved, and we know not whether to admire more the lucidity with which the author establishes his premises, or the strictly scientific methods by which he deduces his conclusions. To follow such close reasoning requires a degree of con-

centrated attention which is not to be expected of ordinary students, and the subtitle, "An Introductory Study," need not be taken to mean that this is a book for beginners.

A trustworthy introduction to the general field of Muhammadan law has long been lacking. There were several translations of Arabic treatises, few of which were remarkable for accurate knowledge either of Arabic or of law; there were many detached papers on separate points of origin and development, especially by Snouck Hurgronje and Goldziher. Almost every book on the Muslim civilization touched the subject more or less gingerly and unhappily; but there was no general introduction. Into this gap, as into so many before in its centuries of history, the Leyden school of Arabic has now stepped with Dr. Th. W. Juynboll's 'Handleiding tot de kennis van de Mohammedaansche Wet' (Leyden: E. J. Brill). The sole defect in this book is its Dutch garb, which will render it impossible or hard of approach for far too many. It itself is a complete introduction. It begins at the beginning, and should be intelligible to the end for any non-Arabist who has interest in law. After an introduction dealing with the Qur'an, the traditions, the schools of law, and the bases (or sources) of the legal system, the different chapters of law are taken up and treated at length. This, of course, is not done with the same detail as by Sachau, in his 'Muhammedanisches Recht'; but, on the other hand, Sachau deals with those chapters only which may be described as public law, and leaves untouched the more personal and religious sections. Here the whole ground is covered, though not in such minuteness. Last come appendices and excellent indices of names and technical terms. The book may be commended to all students of legal history and usage as opening to them, practically for the first time, one of the great developments in its full width. And it would be hard to improve on the exposition which we have here.

The history of the Town Council of Amsterdam is a curious one. The members were elected for life from a restricted list of reputable and solid citizens. The body became the closest kind of a close corporation, consisting of fathers, sons, brothers and cousins, while relations of the worthy councillors not having a seat in the *Vroedschap* were provided with lucrative positions in the gift of the municipality. Not until the middle of the seventeenth century were laws enacted against this excessive nepotism, nor were they invariably observed. Mr. Johan E. Elias, in 'De Vroedschap von Amsterdam, 1578-1793' (Haarlem, 1904), gives a good sketch of the Town Council, but his main purpose is genealogical, not historical. He has made an exhaustive examination of all the general and special archives of Amsterdam for the history of all these "patrician" families, as they were called. Both this volume and the others to come will furnish much matter relating to those who emigrated from Amsterdam, as well as those who remained. Mr. Elias is in a position to make the most valuable contribution to the genealogy of New York settlers that has ever been made, and his work deserves to be known here as well as in Holland.

Mr. William E. Foster's twenty-sixth annual report of the Providence Public Library shows how a library can be administered so as to become a valuable part of the educational plant of a city. The statistics reveal a steady increase in the use of the reference and industrial departments, and in the work in connection with the schools. To numerous deliveries of books to schools and clubs has been added practical instruction to 1,500 children at the library in regard to its resources and their proper use, as well as to the graduating classes of the fifteen grammar schools by Mr. Foster himself. Under these circumstances it is not surprising to read that, while the circulation for 1903 was larger than for any previous year except 1897, the percentage of fiction read was the lowest in the history of the library.

The Calendar of "The Imperial University of Tōkyō" for 1903-4 is, in its corpulent proportions, an index of the great development and extension from the days of half a century ago, when "an office for the examination of barbarian books" was opened in Yedo. The edifices of the six colleges of Law, Medicine, Engineering, Literature, Science, and Agriculture are all, except that of the last, placed within the spacious grounds formerly occupied by the feudal lord of Kaga. Since 1897, when it received its present name to distinguish it from the sister institution then founded in Kioto, the history of the University is easy to follow. In the present calendar the chief features, in addition to the elaboration of detail for each college, is the notice of the preparation of a National History to be compiled from authentic records. Under various names, the committee has been more or less occupied for sixteen years. The work was expected to be completed by March 31, 1900, but it has been again prolonged for another period of fifteen years, in order to revise and publish the material already collected. In Part III., in the list of journals, memorials, and bulletins, published since 1887, we find that, of the "Historical Materials of Japan," volumes iv., vi., and xii. are already published. They relate respectively to the Kamakura period, the period of the schism in the imperial line, and the Yedo period. Five volumes of old documents relating to the periods from (A. D.) 702 to 769 are also published. Under the head of "Old Diaries relating to Japanese History," we find that no fewer than thirty-one volumes are apparently at the service of the public, though no details are given as to publication. Of all these, the text remains in the Japanese. The number of papers in English, French, and German on scientific and learned themes runs into the hundreds. The list of graduates since 1878, arranged under classes, is given, showing a grand total of 5,459, of whom 391 are deceased. Of the students on the roll in September, 1903, there were 3,771; the highest number in any college, that of Law, being 1,185, and after that the colleges of Medicine, Engineering, Literature, Agriculture, and Science following in order of preference by students. Besides the thoroughly modern character of the various scientific departments, it is interesting to note the fulness of organization of the departments of Japanese and Chinese history, literature, and philosophy.

—Again Messrs. Dodd, Mead & Co.'s 'New International Encyclopædia' has made a great leap in publication, and with the usual results. Volumes XV. to XVII. have appeared, and the account is closed. Haste, says the Arabic proverb, somewhat broadly, is of the devil. This is true, at any rate, of books and printing. Of the present work, as a whole, an opinion has been fully expressed from time to time in these pages. The best that can be said of it now is, that an evident effort has been made to remedy the equally evident initial weakness in the editorial staff. Much might have been done; more should have been done; something has been done. It is to be trusted, however, that the editors and publishers realize that this is simply a beginning. If their object is to furnish the leading encyclopædia in the English language short of the 'Britannica,' and to justify the title 'International,' doing for the English-speaking peoples what 'Meyer' and 'Brockhaus' do for Germans, they must set before themselves a series of supplemental volumes and then a new edition, recast throughout. For example, the last volume of 'Meyer's' fifth edition appeared in 1897; then came yearly supplements with exceedingly valuable contents in 1898, 1899, 1900, 1901; now a thoroughly remodeled sixth edition is well on its way. The results are evident in the work itself. Industry and perpetual revision are the price of accuracy and encyclopædic success, and it may well be that, after two or three such transformations, the 'New International' may really rival Meyer. It will surely be hard if the United States cannot supply as good an article as Germany—at double the price. In the meantime the American who can read English only, must be content with the measure of success here attained. It will be prudent in him, however, to read cautiously, to distinguish the varying value of the several articles, and to verify whenever possible. Unhappily, he will be sorely hindered in this by the many articles left without citation of authorities. But these it will be his highest prudence absolutely to neglect.

—All universities foster talent and are stepmothers to genius; rightly enough, since their mission is to be careless of the single life and cherish the type. In the first half of the last century the English universities were sunk in a lethargy from which the authorities roused themselves only when it seemed desirable to suppress an original mind. Tennyson lived to see the Cambridge of 1830, which he denounced

> "because your manner sorts
> Not with this age wherefrom ye stand apart,"

transformed, about two generations later, by a more sympathetic race of dons, with whom the undergraduates could actually exchange ideas. Twenty years before Tennyson and FitzGerald, despairing of the Cambridge professors, set out to educate themselves, Shelley and his friend Hogg were suffering a similar disillusion at Oxford. The latter's account of their undergraduate experiences has been quoted over and over in the biographical notices of Shelley; but Mr. R. A. Streatfeild's charming reprint of 'Shelley at Oxford,' by Thomas Jefferson Hogg (London: Methuen & Co.), is certainly the first convenient edition for those of the present generation who are interested in this vivid picture of Shelley's youth. Of Oxford in 1810 Hogg naïvely remarks that "although no great facilities were afforded to the student, there were the same opportunities of solitary study as

in other places." For the two terms, or about six months, which were the limit of Shelley's undergraduate career, Hogg was his inseparable companion, and they were expelled together. His admiration for Shelley's gifts and the charm of his personality led him to record every detail of their studies, their country walks, and their amusements, which were rare, for they were both ascetics with the asceticism of youth, which consists mainly of indifference to regular meals and preference for eccentric hours of study.

—Opposition is the life of such characters as those of Shelley and his Boswell, but they felt keenly the disgrace of their expulsion. Shelley "sat on the sofa, repeating with convulsive vehemence the words 'Expelled, expelled,' his head shaking with emotion, and his whole frame quivering." The plea for "Universal Atheism," the cause of this expulsion, was anonymous and was never offered for sale. It was a foolish schoolboy performance, and should have been treated as such. Hogg became a prosperous Government official, and to him Oxford made no reparation. To the memory of Shelley, some three generations later, University College erected, close to his old rooms, an unsightly, overdecorated cupola, under which lies Onslow Ford's pathetic marble figure of the drowned poet. That is Oxford's *peccavi* or palinode—well meant, no doubt, but excruciating to the eye. To Shelley himself, so cruelly cut adrift in his teens, it would have seemed appropriate enough that that symbolic image of defeat should be the chief treasure of his college. But Oxford's repentance is sincere; Shelley's watch and seals are religiously preserved in the Bodleian; his poems are even set in the degree examinations, which last concession (the most thorough-going that Oxford could make) might have disarmed the bitterness of this most loyal of the poet's friends, could he have lived to know of it.

—Compilations like Ralph Lefevre's 'History of New Paltz, New York, and Its Old Families, 1678-1820,' appeal to the local residents and descendants of the early settlers rather than to the general reader. New Paltz is to-day an Ulster County village of about one thousand inhabitants, the township of the same name having only about 2,200. It does not, therefore, occupy a large part in the history of the State. But a certain distinction is claimed for it because it was one of the few places in this country settled by Huguenots, because the patentees there purchased their land from the Indians before William Penn made a similar purchase in Pennsylvania, and because "the homesteads have been handed down in the family ever since the first settlement." The Huguenot settlers went from France to the German Palatinate, whence they removed to this State from 1660 to 1675; hence the name of the Ulster County town. Mr. Lefevre has brought together in accessible shape the old records which throw light on the early ownership of land and the first steps towards a government. They describe the superseding of log cabins by houses of stone; the displacement of the French language by the Dutch, and of the latter by the English; the change from a simple regulation of public affairs by the heads of the families to Government by the "Dusine" (Twelve) chosen annually, who had supervision of land titles—the body of voters deciding for themselves a large part of the public questions coming up, from the election of "chimmily viewers" to the purchase of a pall and a silver cup for the church; and the division of the land, originally cultivated in common. The history of the churches is given in detail, and family records are spread over many pages. A good deal of this material, together with stories of contests with the Indians, accounts of early amusements, and the experiences of hunters in pursuit of game (which then included deer and wild turkeys) and such animals as bears, wolves, and panthers, could be made of general interest in skilful hands; but Mr. Lefevre is a compiler rather than a maker of literature, as his "picture of a farm scene" on page 193 illustrates, and he not only fails to tell an interesting story, but throws his topics together in such haphazard fashion that one must hunt from page to page to complete an examination of any one of them. The descendants of the first settlers will find much to interest them in the book, and the very complete index of names will assist them in discovering what they want to know.

—'Law in Daily Life' is the title of a little handbook translated from the German of Rud. von Ihering, with notes and additions by Henry Goudy, Professor of Civil Law at Oxford (Oxford: Clarendon Press; New York: H. Frowde). It is a collection of legal questions (the answers not being given) connected with the ordinary events of everyday life. The original plan of the book, which has passed through eight editions in Germany, may be seen at a glance. The table of contents—"(1) Railway Travelling; (2) At an Inn; (3) In Hired Apartments; (4) Household Affairs; (5) At a Tailor's," etc., etc.—resembles that of a conversation-book for beginners in a foreign language. The author's idea is to bring before the mind of the student the many legal relations and questions arising out of them suggested by the ordinary events of every day; *e. g.* (at a tailor's), it is a question what kind of a contract is made with a tailor when the customer supplies the cloth. Again, if there is no agreement beforehand, "can the tailor charge as high as he pleases? Can he retain the coat till payment is made?" Such questions, the author thinks, owing to their involving small amounts of money, rarely lead to an action; but, however this may be in Germany and in other countries which derive their law from Rome, we should say that in England and this country there was no question involving a matter however trifling which might not arise in court. However, a collection of questions presents to the mind of the student a vast array of legal problems, involving the most important principles in the practical form in which they suggest themselves in real life. The translator has added some questions in English law, which show that the method might be readily used for teaching common law. In fact, it is the "quiz" method systematized and perfected by a legal genius.

—Professor Burnet of the University of St. Andrews is the highest living authority among English scholars on the philosophy of Aristotle, an author curiously neglected by American universities. He has recently published in the "Cambridge Series" a volume of 140 pages entitled 'Aristotle on Education' (Cambridge: University Press; New York: Macmillan), in which he presents a translation of the Aristotelian views of education as they have come down to us in the 'Politics.' Unfortunately, while we have complete Plato's treatment of education in the 'Republic,' Aristotle's discussion is a fragment. In fact, he does not arrive at the education of the mind at all, though he plainly meant to deal with it after the discussion of the education of the body, on which we probably have all that he had to say, and the education of character on which he left much unsaid. Gymnastics for the body, music for the character—so far, then, Aristotle takes us; for the mind, whose training should crown the whole, not a single word. To Aristotle, as to Plato, it would have seemed impossible to treat of education apart from politics; the citizen came first. But he looked no less to the individual man, and for him the ideal education was that which should fit a man to enjoy his leisure; the noble use of leisure being the highest aim of education. For Aristotle thought, and most people will agree with him, that what a man does with his spare time is the true test of his character and training. It remains uncertain what scientific studies Aristotle would have recommended, or did recommend. It is, however, an interesting fact that the development of mathematics which dates immediately after Aristotle, was carried out by men who were connected with the school of Plato; the Aristotelians did not contribute a single great mathematician. Aristotle himself cared more for biology and history, while Plato, the visionary, made mathematics the copingstone of the studies that were to fit the noblest men in his Utopia to govern the rest. Professor Burnet's translation is based on his view, doubtless correct, that the 'Politics' and the 'Ethics' were merely lecture notes, and so not to be judged from the point of view of style as we judge a dialogue of Plato. He has happily caught the lecturer's tone, and managed to be literal without being dry. It is a real triumph to have made Aristotle conversational; you see him leaning over the desk to illustrate his point with the epigram (now a commonplace) that one swallow does not make a summer, or to remark with dry humor that people don't deliberate about everything—for instance, a Spartan would never deliberate about something that had not to do with Sparta. To the scanty pages of the 'Politics' on education the translator has prefixed a hundred pages from the 'Ethics,' so that the reader may first realize Aristotle's theory of human happiness before he proceeds to consider how education may be made to secure it. The running commentary and the introduction are admirable.

GEN. GORDON'S REMINISCENCES.

Reminiscences of the Civil War. By Gen. John B. Gordon of the Confederate Army. With portraits. Scribners. 1903.

The lamented death of Gen. Gordon gives peculiar interest to these Reminiscences, as in the most serious sense his last word concerning great events. He was from first to last more than merely an observer. He was an actor constantly growing in responsibility and aggressive vigor, in audacity tempered by intelligent judgment, so that

finally Gen. Lee left to his discretion the time and place when and where, if at all, the Army of Northern Virginia should cease to exist. He was a furious fighter, who tells his tale with the modesty of bravery; a wise counsellor, who lays no claim to omniscience. But, from the day of his inspired ignorance when, with no military training, but flaming with patriotism toward a Provisional Government of six States, he led to Montgomery a company of mountaineers, to the closing campaign, in which Lee leaned upon him, a lieutenant-general and a trusted corps commander, there does not appear to have been a moment of hesitation, whatever the peril or how serious the demand, when he believed Confederate duty called. His subsequent career was one of the most notable results of the war fought over the doctrine of secession. An active belligerent from first to last, he frankly recognized that the sword to which the South appealed had decided for the Union. He manfully accepted the decision, and devoted an eloquent life to "strengthen the sentiment of intersectional fraternity which is essential to complete national unity." In Gen. Gordon's civil career the defensive nation, aroused by Sumter, stung at Bull Run, and fighting desperately for four years for existence, realized a peculiar triumph. That career was devoted to inspiring his comrades and their sons with love and respect for the country whose corporate destruction had been sought. It was to regain and retain her revolted citizens that there had been war.

As history, there are three salient points among the multitude of incidents with which this volume bristles. The first is the well-known fact that Ewell halted on the first day at Gettysburg, when, as Gordon believed, in half an hour he might have occupied Cemetery Hill. The other two claims are practically new, in the sense of being generally unfamiliar. One is that Ewell, influenced by Early, disregarded Gordon's advice to fall on the exposed Federal right flank in the Wilderness; the other, that Early, again from inappreciation of the situation, checked the advance at Cedar Creek when nothing but his word stood between the Sixth Corps and annihilation. In connection with Gettysburg, the familiar accusation against Longstreet of dilatoriness on the last two days also is reiterated. The weight of available evidence seems to sustain Gordon's categorical charge (p. 160) that Longstreet failed in the element of time to respond to Lee's command. But final decision should be reserved until the publication of Longstreet's posthumous defence, understood to be in the press, under his widow's name. The great and merited devotion of every Confederate to Lee makes it easier for them to believe that a subordinate must have been at fault.

The possibility of carrying Cemetery Hill at the time Gordon was halted beyond its base, must ever remain a matter of opinion. The propriety of Ewell's order to halt is a distinct question. When the First and that part of the Eleventh Corps (Federal) which had been engaged were forced back by superior and constantly increasing numbers, they concentrated on that hill which was already held as a rallying-point by an unengaged division and two batteries. These troops had been carefully posted behind stone walls and were covered by skirmishers. As the retiring troops reached the hill they took station on each flank of the waiting command, "and soon a formidable array of artillery was ready to cover with its fire all the approaches." Hancock, a tower of strength, was also present, and fresh troops were arriving. Howard and Hancock had already agreed that Cemetery Hill was an essential part of the prospective battle-ground. It seems probable, but probabilities in war are not final, that Ewell could not have carried Cemetery Hill on the afternoon of the 1st of July. The Union First Corps had been roughly handled and forced back, but the Confederates had been roughly handled also. Gen. Hunt of the Union army, a most competent judge, although not upon that field until after midnight, asserts that "an assault by the Confederates was not practicable before 5:30 P. M., and after that the position was perfectly secure." Early in the day Ewell had properly been restrained by Lee's order, given at a distance, not to bring on a general engagement until his army was concentrated. This was repeated by Lee from Seminary Ridge as a proviso in the order, sent through a highly qualified staff officer, to carry the hill if practicable. This competent officer, Col. Long, and Ewell together "found the position a formidable one and not accessible to artillery fire." Wisely they suspended operations, perhaps remembering Malvern Hill, although Gen. Gordon looks on the decision as an example of what Washington calls "untimely discretion." It would appear that Gordon's martial impulse overrides his military judgment in this expression of regret; and Lee's later longing for Jackson, Ewell's predecessor, as an insurer of victory, might well refer to some other phase of the three days' battle.

After a fierce collision on the 5th of May, the first day's fighting in the Wilderness campaign of 1864, Gordon's brigade was transferred in the night to the extreme left of Lee's lines, which, it was thought, Grant overlapped. To Gordon's surprise and delight, his scouts reported at dawn that in fact the Confederates extended far beyond the Union flank, which really was in the air and wholly unguarded, as well as without support. He verified this by a personal reconnoissance and independent examinations by others, covering several miles, and then begged that his own brigade and the next be allowed to roll up the Federal line, for no exposed and unready troops could withstand a sudden flank assault. However, Early, Gordon's immediate superior, possessed with the belief that Burnside, who actually was well to the Union left, was supporting the extreme right, disapproved, and Ewell, Early's superior, would not overrule him. But when Lee visited that front at 5:30 P. M., he immediately authorized the venture, for the double purpose of inflicting direct damage and of relieving the troublesome tension on his own right. The attack began as the sun went down, and, notwithstanding it was soon cut short by the darkness, it resulted in the capture of two generals and many men, in numerous Federal casualties, and in serious dislocation of that part of the Union line at comparatvely little expense to the Confederates, and that chiefly from their own cross-fire. Both lines were readjusted in the night. The Union military writers have naturally made light of this diversion, because it did not derange Grant's plan as a whole; and even Early, possibly because, saturated with the fear of Burnside's proximity, he had so entirely disapproved of the attempt, in his Memoir minimizes its importance, and congratulates himself that the Confederates got out of the natural confusion as well as they did. But that attack held the germ of a great disaster to the Union arms.

Gordon grew to be more nearly Jackson's natural successor than any subordinate Confederate general, although it does not appear that he was recognized as such until late in the war, if even then, by those whom he gradually overshadowed. He lacked Jackson's technical training, and certainly was not so harsh a disciplinarian; but his genius for leadership and his matchless courage developed an aggressive enthusiasm in the ranks, where Jackson's austere command simply yielded confidence. Gordon had all of Hood's dash that was valuable, with vastly more discretion, and united to the pertinacity of Longstreet and the gallantry of Pickett a wealth of practical resource that placed him on a very high military plane. He was born with military genius, as was Forrest; but it required the experience of the field to develop it into a highly efficient working power. If any Confederate could have delayed preordained disaster, it might have been Gordon holding a high command under Lee earlier than he actually attained it. He had much of Jackson's unswerving faith in an overruling Providence, and it was that faith alone which finally reconciled him to Jackson's loss when he reflected on "His control of the destinies of this republic." For from the human point of view the inner light revealed to him that in the Wilderness a Jackson would have rolled up the Union right on the 6th of May, with which we must agree; and also, with a confidence we do not share, he believed that at Gettysburg Ewell's corps plus Jackson would have forced the Federal troops from that field in irremediable flight on the first of July.

The other important allegation is that Gen. Early at the crucial moment halted the conquering Confederates at Cedar Creek, thus throwing away victory and preparing for their own rout later in the day. Gordon, now a major-general, led three divisions in the night over the presumably impracticable Massanutten Mountain, and at dawn surprised and put to flight all the Union infantry except the Sixth Corps. As he was about to concentrate his artillery, thirty pieces, more or less, upon those steady troops, Gen. Early, as alleged, came upon the scene and announced that there was glory enough for one day; and when Gordon urged the destruction of the remaining Federals by artillery fire, he replied that it was useless, for "they will all go directly." They did go back, but in an orderly, soldierly manner, unshaken and undismayed. In the afternoon the tide that had ebbed in the morning came flooding in, bearing with it Union victory. Gen. Gordon believes that the Sixth Corps was at his mercy at Cedar Creek, as it had been in the Wilderness, and that for the second time Gen. Early was the evil genius of the Confederacy. He charges neither disloyalty nor pusillanimity. He does imply inefficient generalship, an inadequate grasp at a critical time. But he is particularly aggrieved by Gen. Early's charge that plundering made advance impossible. Early's report of the battle (Official Records, 90, p. 562) asserts: "Word

was sent to Gordon . . . and Kershaw . . . to . . . advance with their divisions, but they stated in reply . . . and that their ranks were so depleted by the number of men who had stopped in the camps to plunder that they could not advance them." He adds (p. 563): "We had within our grasp a glorious victory, and lost it by the uncontrollable propensity of our men for plunder, in the first place, etc." "I had endeavored to guard against the dangers of stopping to plunder in the camps by cautioning the division commanders, . . . and I endeavored to arrest the evil while in progress, without avail." Such reports flew far and wide, and this official explanation of the untimely rest has made an indelible impression, so that the Confederates at Cedar Creek have become an historical example of the sacrifice of victory by indiscipline. But Gen. Gordon denies with emphasis that he and Gen. Kershaw received any order to advance, or that they ever replied that they could not. "Our troops were not absent. They were there in line, eager to advance." "We were not only urgently anxious to advance, but were astounded at any halt whatever" (p. 365). He also presents many competent and credible witnesses to disprove the charge against the men in the ranks as straggling plunderers. That the captured camps were plundered is true—the truth seeming to be that the despoiling was by crowds of unarmed convalescents who had rejoined the army while still unfit. Spreading over the field in search of booty after the organized troops had passed in pursuit, they deceived Gen. Early, and he misled the public. It is Gen. Gordon's bitter regret that his own report appears never to have reached Gen. Lee. Tenaciously as Gen. Early held opinions once formulated, nevertheless several days after the battle he said to Capt. Hotchkiss of his staff, about to report in person to Gen. Lee, that they should have advanced in the morning, although he cautioned him not to tell the general that (Official Records, 90, p. 582). This indicates a private conviction and personal retraction, notwithstanding persistent failure to make it publicly. From 10 A. M. to 4 P. M. the Confederates rested on their arms, making even no organized effort to carry off their captures, and Gordon might well feel dejected to see the ultimate consequences of his superb initiative lost through sheer passivity.

The result of an unfought engagement is problematical. The audacious and wholly unlooked-for assault at the break of day, on a flank that seemed perfectly protected by nature, drove off in confusion two large Federal commands. Had the temporary but vast preponderance of Confederate artillery opened against the Sixth Corps on a field so favorable to such fire, much damage must have been inflicted. But that corps, in excellent discipline and admirably commanded, could not have remained unresisting; and there was also an intact cavalry division to be reckoned with, against which it is unlikely Rosser could have made much head. Doubtless for tactical considerations the Union troops would have retired, but it by no means follows that they would have been defeated, nor that Wright, with such brigades as stood fast or rallied, would not have carried into effect, as he planned, the forward movement that Sheridan executed.

A single other comment on the clash of arms. Early's advance against Washington in July, 1864, was rendered fruitless by Wallace's tenacious and self-sacrificing resistance on the line of the Monocacy. Gordon recognizes the quality of that defence, but does not seem to appreciate that the delay thus caused, where no more than delay could be hoped for, made it possible for the Sixth Corps to march directly from the Potomac transports out the Seventh Street road, as Early's skirmishers deployed before Fort Stevens. Except for Wallace at the Monocacy, the Confederates might have had the moral advantage of a temporary occupation of the capital.

Besides the alarms of war, the Reminiscences illustrate in many ways the men and times of the Confederacy. The first chapter holds as clear and temperate a statement of the difference that led to armed collision as we may ever expect from one actively engaged. But nowhere is there repining at the result. The doctrine of predestination appears to have done its perfect work, so that, vigorous human resistance having proved unavailing, the issue is accepted as providential. Gen. Gordon is disposed to paint the internal discipline of the Confederate camps in brighter colors than we may accept, and there is none but jocose reference to the unrelenting conscription that drew into those camps practically the entire fighting population of the white South. It was the war of an oligarchy, and those who in uninstructed enthusiasm volunteered at the beginning, were retained by the same strong arm that forcibly added recruits to their gaping lines. As they reached the virile age, high-spirited youths continued to volunteer, but the rank and file that bore the heat and burden of the day, the men with domestic responsibilities, not concerned with abstractions of State rights and problems of the tariff, to say nothing of having no vital interest in the "peculiar institution," had Confederate pressure, not State loyalty, to draw them from their homes. Exemptions and discharges alike were few. There were no time-expired regiments, no reënlisting veterans. Certainly the leaders who put their hands to the military plough did not look back until stopped by exhaustion, nor did they allow the working force to halt. Once armed, the contagious sympathy of numbers and the hereditary instinct developed by the conditions of the field made one and all, conscripts and volunteers alike, superb fighters. The Confederate yell (the adjective used to be shorter) expressed the *gaudium certaminis*. It could be raised only by men who found joy in battle. Nevertheless, Confederate discipline was bad, even in 1862, when it should have been at its best, Gen. Lee himself being witness (Official Records, 27, p. 143; 28, pp. 617, 618, 643). As not unusual in time of war, religious ardor ran high in the Southern camps, and there are frequent references to prayer meetings at which officers and men were common suppliants for divine grace and material help, praying (as one expressed it) that the Lord "would take a proper view of the subject" and give them victory. Certainly if martial audacity and brilliant courage bore the same relation to Providence that the largest battalions have been said to sustain, those persistent fighters might feel sure of such support. The most dramatic situation of the whole book is Lee's midnight consultation with Gordon, out of which followed that extraordinary, although short-lived, triumph of deliberate daring, the capture of Fort Stedman by night assault—to our mind the most remarkable exploit of the war. That Gordon should plan and Lee permit such an assault, shows that in campaigns all things are possible to him who ventures.

It nowhere appears in this narrative how or when Gen. Gordon received his various promotions higher than that of Major Sixth Alabama; there is no record of the accessory honors that must have been his, and there is merely the most necessary mention of his disabling wounds and of his personal activity in the field. It is a modest tale, filled with vitality. Under Gordon's implied doctrine of predestination, the war had to come. Having come, we place George H. Thomas before Robert E. Lee. Having come, we thank Providence that Gordon so closely rivalled Lee in those qualities which, outside of the larger view at a critical time, made him a great American. In peace both men have deserved well of the country, and Gordon's later life and oratorical power carried his personal influence to a younger generation as well as to his own. When death removed him, a great and good American was taken away.

The clerical error of Kinsey for Kinzie (p. 32) should be eliminated.

Fleuves, Canaux, Chemins de fer. By Paul Léon. With an Introduction by Pierre Baudin, former Minister of Public Works, Paris: Armand Colin. 1903.

Towards an epoch-making mechanical invention the public commonly manifests a curious alternation of unreasonable distrust and unreasonable credulity. The new device at its advent encounters the contemptuous and often noisy disapproval of the few whose interests the newcomer jeopardizes. To this chorus there succeeds the equally uncritical applause of the many when once the success of the new machine or process is concretely demonstrated. By this time the spirit of speculative prophecy has been unloosed which can discern no limits whatever to the conquests which the new apparatus both mechanically and commercially is destined to attain. Long afterwards these too early and too optimistic forecasts are corrected soberly, and the new invention is set in due relation to the rest of the world's working equipment.

This was essentially the case with steam railroads. Henry Fairbairn, in his 'Political Economy of Railroads,' which was published in 1836, less than a decade after their introduction, spoke of canals as "the rude invention of a former age." In France the continuance of freight carriage by canals seemed in 1844 extremely doubtful. And yet, despite the marvellous way in which the railroad has transformed the economic life of the modern world, it is a fact not only that canals have not been discarded, but that the improvement and extension of inland waterways is more prominently than ever the avowed public policy of Germany, France, and Austria. It is to the tracing of this policy in France that M. Léon's volume is chiefly devoted, though he also essays to assess the rôle that inland navigation in general may reasonably be expected to play in the general drama of transportation.

How rapidly France was reticulated with railroads may be inferred from a lively

comparison which M. Léon presents. In 1846, when the French harvests were a failure, it was found physically impossible to transport Russian wheat into certain of the departments of France which were threatened with famine. Thus, while Provence teemed with provender, Indre was affrighted with hungry mobs and sanguinary bread riots. In 1854, only eight years later, when a similar crop failure occurred in France, the fear of famine had been wholly exorcised, thanks to the completion of the railway net.

The reversion to the earlier and all but discarded policy of improving inland waterways is traceable in France to the popular alarm felt after 1860 at the rapacity of the railroad companies when they had, each in its own territory, acquired a virtual monopoly of traffic. The indictments brought by M. Léon against the companies read like a version of our own Granger movement. Discrimination, extortion, special rates, and rebates (*tarifs d'abonnement, tarifs de saison*), and the exaltation of the railroad company to the post of arbiter of the industrial success or failure of the individual plant or manufacturer, all seemed intolerable. To temper or to break this monopoly recourse was had to inland water transportation. M. Krantz began with a thoroughgoing *enquête* in 1872. In 1879 M. de Freycinet undertook on a large scale the work of creating a modernized system of internal navigation. In 1880 all tolls on French waterways were abolished. Within fifteen years the tonnage thereon had doubled, although for forty years previous it had been at a standstill. During the first period—1880 to 1895—the tonnage by rail increased by 30 per cent. The De Freycinet scheme, unfortunately, was soon overlaid with a sorry lot of political jobs. Every part of France, no matter how ill-suited to serve as an avenue of national commerce, demanded its share of the lavish appropriations which had been foisted upon the budget. It was the old story of a universalized local grab which has so often characterized our River and Harbor bills. In 1879, for example, fifty-two millions of francs were expended for these purposes; in 1880, one hundred and three millions; in 1883, one hundred and forty-six millions. Then came the inevitable retreat, involving the abandonment of public works estimated to cost nine hundred and seventy-three millions, and the heavy attendant losses due to unfinished work, lapsing contracts, and the like. While France had been wasting her resources in thus spreading thin her expenditures over fifty or sixty seaports and over canals in all parts of her domain, England had concentrated her expenditure on a few great seaports; and Germany, besides beginning the canalization of the Rhine, had built up by lavish expenditure, chiefly on Hamburg and Bremen, the two greatest maritime ports of the Continent.

So lasting were the popular memories of the wasteful De Freycinet programme that in 1891 M. Pierre Baudin, at that time minister of public works, was unable to secure the definitive approval of the French Senate to his conservative scheme of public improvements. Though adopted by the Chamber of Deputies, it was practically postponed by the non-concurrence of the upper chamber in many essential details. It is still, therefore, at the bar of legislative approval. The scheme of M. Baudin involves an expenditure of 163,080,000 francs on ten of the most important seaports, the improvement of seven existing internal waterways at an estimated cost of 60,630,000 francs, and the creation or improvement of nine additional waterways at an estimated cost of 479,640,000 francs. On its financial side the project is guarded by incorporating the principle of riparian participation to the extent of one-half of the cost of all the new works projected. This general principle—"Aide-toi, l'État t'aidera"—has been adopted in Germany and Austria, and might well prove the effectual means of restraining our annual expenditures on rivers and harbors. The detailed discussion of the plan into which M. Léon enters in chapters 4 and 5, presupposes somewhat intimate acquaintance with the topography and commercial geography of France. For this reason it is less apt to attract the general reader than the author's very interesting description of the German canalization of the Rhine, or his discussion of the respective shares in the future work of inland transportation that may be properly allotted to rail and water, respectively.

A significant fact connected with the improvement of the Rhine for navigation is that while its traffic in certain instances increased four-fold between 1880 and 1898, the tonnage of the Westphalian railroads, in some ways competitors for the Rhine's traffic, simultaneously increased almost a hundred per cent. In part this augmentation of the railroad tonnage was due to the avowed policy of the roads to divert traffic by special rates away from Rotterdam to Hamburg and Bremen. Those who cherish the idea that State railroads are certain to do away with iniquitous discrimination may read with profit the detailed account of the flagrant and unblushing discrimination practised by the Prussian railroads even against their own countrymen interested as shippers or carriers in the navigation of the Rhine. The railway bureaucrat, no less than the railway autocrat, can seemingly unite in the apothegm commonly attributed to the elder Vanderbilt. "Multæ terricolis linguæ, cœlestibus una."

M. Léon arrives at the seemingly reasonable conclusion that instead of the railway and the canal or navigable river being regarded as competitors battling *à outrance* for exclusive possession of freight traffic, they may reasonably be regarded from the standpoint of the public interest as coadjutors. The rôle assigned to the canal must be a relatively subordinate one, of course. Fast freight, for example, is an exclusive possession of the railroad. But the true explanation of the persistence of waterborne traffic is the relative insignificance of its cost as compared with the corresponding items of cost by rail. The resistance to traction by water is estimated variously at from one-third to one-fifth of the resistance by rail. The cost of canal construction per mile is estimated by the author at about two-thirds of the cost of the average railway roadbed; and operation and maintenance per mile at a ratio of 17 to 62.5 in favor of the canal. Barges, he estimates, are about eight times cheaper than freight cars of equal capacity. It is not surprising, therefore, that French freight rates by inland waterways are about one-fourth of the rates paid by rail-borne freight. If, as the author argues, electricity is destined eventually to be used for canal traction, the cost of administration and operation will apparently be augmented. Whether the increased volume of traffic and the improved organization of its transmission will offset the increased expense, is a question for the experts. However, if one may presume to judge by human experience dating from the Pharaohs and extending to this year of grace, it is safe to hazard the opinion that inland waterways will retain indefinitely a permanent and an important, though an indisputably subordinate, place among the transportation agencies of the future.

Personal Reminiscences of the Duke of Wellington. By Francis, the first Earl of Ellesmere. Edited, with a memoir of Lord Ellesmere, by his daughter Alice, Countess of Strafford. E. P. Dutton & Co. 1903.

It is well known that the great Duke of Wellington was not a man of many intimate friends, so that it is not strange that, of all the books which have been written about him, hardly any should have proceeded from those who personally knew him well. But during the last twenty-five years of the Duke's life, Francis Gower, son of the Marquis of Strafford, and created Earl of Ellesmere in 1846, was in constant social intimacy with him at Apsley House, Strathfieldsaye, and Walmer, as well as at the country houses where they both were guests. The Earl began to write on the day after the Duke's death, and this volume is compiled from a sort of diary or book of reminiscences in which he made memoranda about the Duke from time to time. In it, therefore, we have no mere detailing of general anecdote and gossip, but recollections by one whom Wellington seems really to have loved, and whom he certainly trusted to a remarkable degree. Herein lies the peculiar interest of the volume, and not in much that is specially new; for most of the important matters and many of the anecdotes in it have already become known to us from sources not first-hand, as this source is.

Thus, on the Duke's portraits, by which alone we can now know his personal appearance, it is interesting to have the verdict of one who was with him so much:

"The best sculpture of and concerning him is Steele's statue at Edinburgh, and the bas-reliefs on Marochetti's pedestal at Glasgow. The best portraits, Arbuthnot's half-length by Lawrence, and Sir Robert Peel's whole-length, standing with the telescope, also by Lawrence; one of the worst, Lord Bathurst's equestrian full-length, which is a libel on poor Copenhagen, who was not made of wood."

And this also is an interesting bit: "He was no neglecter of his own person, and his ablutions were not of the partial and scanty old school. He not only looked clean, but was so. I do not remember that in his society I ever heard from any one, still less from him, anything which might not have been repeated before ladies." Of that fear of approaching the Duke with remonstrance, under which so many of his contemporaries labored, the Earl seems to have had little or none: "I have combated his views and maintained my own with him over and over again, and never could detect in him the slightest trace of obstinacy of conviction or impatience of dis-

cussion." But here he is speaking of civil matters, and adds: "In any professional matter he was adamant, and neither Arbuthnot, nor I through Arbuthnot, could have made the slightest impression on him."

The Duke's contentedness of spirit once more finds good illustration here: "He had the propensity of cheerful minds to be satisfied with his own possessions and acquisitions. He thought Strathfieldsaye perfect as a residence, and he thought Walmer, as he thought most places where his lot was cast, charming." Ellesmere, on the other hand, speaks of Strathfieldsaye as a swampy flat, and of the house as a miserable specimen of a French château.

The Duke was a great reader of works on military matters, from Cæsar's Commentaries down to his own time, yet he "made it a rule never to read any work whatever bearing on his own military career. He said that they would merely tempt and provoke him to comments which he could not make without offence to living men." In two cases only does he seem to have departed from this rule: first, in order to supply Ellesmere with a memorandum for his article in the *Quarterly*, in 1845, on Alison, Marmont, and Siborne; secondly, when he wrote his famous memorandum in reply to Clausewitz's 'History of the Campaign.' Both memoranda are here given in an appendix; the latter, used by Ellesmere for his *Quarterly* article of 1842, has already been published in the 'Supplementary Dispatches'; the former we do not remember to have seen before. It leaves little of "Alison's nonsense"—"that pompous compiler from Gazettes, who to this hour thinks that the Duke owes half his fame to his writings"—whereas the Duke had got a mistaken notion that this Conservative sheriff "was a Whig, hired by that party to defame and depreciate him. I had much difficulty in convincing him of the real state of the case, namely, that Mr. Alison sincerely admired the Duke, but only admired himself a good deal more." The Earl adds, in speaking of the critics of his article, into which he had incorporated much of the Duke's memorandum: "The blockheads thought that they were commenting on me, or some one of as little weight and authority, little knowing whose language they were criticising and whose statements of fact they were disputing." Of course, it has now long been known under whose inspiration Ellesmere wrote.

Here is a piece of literary criticism by the Duke on a book of quite a different sort. He "used to say that 'Gil Blas' never could have been written, as some maintain it was, by a Spaniard, because it constantly describes dinners, which are unknown in Spain. The only dinner given him by an individual in Spain was by the Duchess d'Ossuna [this is incorrect; he dined once with Madame Sta. Cruz, and once with the King], and *that*, he said, was exactly like Bodas di Camacho in 'Don Quixote,' whole sheep, etc."

Of the Duke's own literary productions, the Dispatches, the most valuable and comprehensive material ever left by a modern to the history of his times, Lord Brougham said to Gurwood, "You have published a book which will live when we are in the dust and forgotten." This was reported to the Duke, who, with all that simplicity of mind and lack of self-consciousness which so distinguished him and so often confounded his opponents, merely remarked, "Very true; so it will."

Prefixed to the Reminiscences there is a brief memoir of Ellesmere by his daughter. There was nothing especially remarkable about him: he was a lover of literature and a patron of the fine arts, a good sportsman, an extensive traveller; indeed, the best of this part of the book is an account, given in letters, of a journey to Madrid and a sojourn there in 1823—a good picture of what now seems to us the almost incredible discomforts which even men of rank had to undergo in travelling in Southern Europe so lately as that time. Some public offices he held in his younger days; but after he fell heir to the great wealth of his uncle, the Duke of Bridgewater, he devoted himself chiefly to the amelioration of the people committed to his care, and his best memorials are the churches, schools, and institutions which he built or endowed. A good likeness of him is given in this book, which is excellently printed in Edinburgh, but is destitute of an index.

Japan To-day. By J. A. B. Scherer. Philadelphia: J. B. Lippincott Co.

The new president of Newberry College, South Carolina, spent four years as instructor in the schools of southern Japan, and made himself familiar with the language, human nature, and especially with the home life of the people. It is one of the great and compensating advantage of residence away from the large cities that one can see the primal springs of the nation's greatness, while realizing more keenly defects and shams. It is certain that in Japan there is an abyss of difference between the governing few and the millions governed.

Man and nature, rather than things of artifice and arrangement, are agreeable to the temperament of the author. In making comparisons, too, he is very happy, and also judicially fair. One antithesis which he develops and handsomely illustrates, is that the Chinese are ethical and the Japanese æsthetical. The burden of Chinese literature, as visible in its three thousand years of production, is that of order, propriety, duty; that of Japan's, during its twelve hundred years' expression, is concerned with things of charm and beauty, of art and decoration. The flower of the older civilization is filial piety; that of the younger, beauty. Though facially alike, the Chinese and Japanese are radically distinct. The former seem densely stupid, and the latter alert and quickly perceptive. Yet, while the Chinese have been great originators, the Japanese are but clever imitators, with a possible exception in the field of fine arts. "If they have ever created anything outright, it has not been shown." The Japanese is shrewd, the Chinaman is deep. The keynote of one character is sentimentalism; that of the other is conservatism.

The opening chapter, entitled "The Cynosure," has evidently been written rapidly and to suit the goddess of the nick of time. Besides military statistics, it gives on confronting pages the naval strength of Russia and Japan in January, 1904. The other chapters, on "Sunrise Land," "Views Awheel," "Glimpses of Home Life," "The Awful Japanese Language," "Sermons Garnished with Smiles," "Life in the South," "The People of the North," etc., go more deeply into things perdurable. The text is reinforced by illustrations, two in colors and the others handsomely reproduced from photographs by an effective process. There is no index, which the book deserves, for here we have not a flat poster, but a true picture, with color, foreground, perspective, and satisfactory grouping. The text throws light on the treatment of the insane, the old way of looking at female humanity, the prevalence of belief in fox possession, the priestly methods of exorcism, and the delightful vanity of the young sprigs of new Japan. One of these, on seeing in the picture of an American city telegraph poles and wires, expressed his surprise that such inventions had already reached America!

The author quotes considerably from other writers in treating of Buddhist sermons and in telling about the Ainu of Yezo; but in talking about the language, and in describing Japanese traits, he is original and informing, speaking out of experience. He attributes to the Japanese the practical negation of morality, as we understand the word. He makes very clear, what so few Westerners can understand, the vast difference between the travelled ministers of the Emperor and the trained naval and army officers, and the untouched multitudes. He frankly acknowledges that, in talking about the ethics of the Japanese, we deal with psychology rather than morals, though the two fields touch at vital points. The common native has no conception of the value of time. "No foreigner that has lived in Japan can ever forget the terrible word, 'Tadaima.' It means by-and-by, which is to say, Never." Apparently the Japanese has no nerves. With us worry kills more people than work, and what will drive a Westerner mad, or cause physical suffering, will leave no more trace of disturbances on a Japanese face than on the bronze forehead of the Dai Butsu at Kamakura. The true Oriental is a man of colossal impassivity. Whether this absence of nerves is a defect or not, it is to us incomprehensible. Hence (shall we say?), the Japanese are strangely lacking in sympathy. Mr. Arinori Mori, who knew his countrymen so well, pleaded earnestly for the inculcation of sympathy, because, said he, "it is the crowning virtue of civilization, and the indispensable basis of the democracy we hope like other nations to become." Often this lack of sympathy amounts to positive cruelty. But the most serious negative characteristic of the Japanese people is the absence of mutual confidence. Suspicion taints every feature of life in the East, retarding commercial development, and hindering that real civilization which, unless it comes from the people, and not from the Government, is sure ultimately to prove a failure. A long resident set down the leading characteristics of the Japanese people as "conceit and deceit," while an eminent Japanese declared these to be "licentiousness and lying." Like most honest scholars who study the Japanese language—sure index of national character—Dr. Scherer finds it "permeated with insincerity." On the other hand, of the positive traits the leading one is economy. "A Japanese can live and lay by a surplus where a Westerner would starve a dozen times over." The wages of a maid servant in the interior, besides her board

and clothing, both of the simplest and cheapest, is three dollars and a half a year. Politeness, based on rules for every possible experience in life, as fixed and inflexible as brass, is another characteristic, and so is industry.

Thus, while the author says all sorts of lovely things about the people among whom he lived, to whom ties of gratitude bind him, and of whom he so highly thinks, he has the courage of his opinions. He devotes an entire chapter to Dr. Verbeck, believing him to be worthy to be ranked with Ulfilas, Augustine, and Patrick, and giving strong reasons in proof of his argument. He writes: "Nor shall we ever despair of the future of a race who, for all their faults, proved so responsive to the spiritual magnetism of a holy life as did the Japanese to this master missionary." In his final chapter on "The Gates of Asia; or, the Larger Meaning of the War," he gives seven reasons for believing that the Japanese will win. Their victory will mean the salvation of China and the triumph of the West in the East. Altogether, this is a timely book, charged with elements of permanent value.

The Life of Nathaniel Macon. By William E. Dodd, Ph.D., Professor of History in Randolph-Macon College. Raleigh, N. C.: Edwards & Broughton. 1903. Pp. xvi., 443.

The present volume is a welcome addition to the literature of American history, not only because it furnishes us with a good account of the public life of a little-known Southern leader, but also because it is another indication of the growing interest in the study of history in Southern institutions of learning. Professor Dodd has made use of some unprinted material—the Macon papers, the Joseph H. Nicholson papers, the Yancey-Steele correspondence, the Warren County records, the Jefferson and Monroe manuscripts—and of some printed material not readily accessible to Northern students. The Macon papers have been used to good purpose at different points, notably in showing that the alienation of the "Quids" began as early as 1803. Of the longer secondary accounts, Schouler appears to have been used almost exclusively. Adams's history is not mentioned in the bibliography or referred to in the text. Indeed, we take it that Professor Dodd has made no use of Adams—that is, of the best history of the United States in the first two decades of the nineteenth century.

Macon was no intellectual giant, like Marshall; he was not a great orator, like Webster; not a brilliant debater, like Calhoun; not a fascinating leader, like Clay. Yet for a quarter of a century he exercised a first-rate influence in his party and in Congress. He was able to do this because of his sound common sense, his industry, his probity, and his never-failing devotion to the duties of his position; because he represented clearly, persistently, and faithfully the ideas of the section from which he came. He was a product, as well as a representative, of the narrow local provincialism and the close-fisted economy of the hard-headed rural classes of Western North Carolina. He believed in State sovereignty, and in a penny-wise governmental policy. He believed in slavery. He believed in expansion for Southern agriculture and in restriction for New England commerce. He believed in unostentatious democracy, both for the individual and for the State. Beyond these things he had little interest and little insight. What he saw he saw clearly, believed in profoundly, and worked for persistently; what he did not see clearly he did not see at all, and cared for as little. His political conduct follows naturally. He mostly opposed the measures that were successful, and favored those that failed. He might be called the great opposer. He opposed the adoption of the Constitution, though not actively. He opposed the Jay treaty. He opposed the nationalizing policy of Hamilton. He feared the "monarchical" tendencies of New England, and was disgusted with the aristocratic pretensions of Washington. He opposed war; New England disloyalty alone was responsible for the failure of the embargo. He opposed governmental expenditures beyond the barest necessities, and voted against the bill to repair the White House furniture, and the bill to erect the Washington monument; he even begrudged Jefferson the postage on his letters. He opposed measures for internal improvements because they were unconstitutional, and the "American system" because it was a scheme to take from the Southern Peter in order to pay the Northern Paul.

Professor Dodd has set the man and his attitude on these questions before us with clearness and force, though with no great literary skill. That he is an admirer of Macon is clear. Yet he is not blind to his mistakes or to some of his limitations. Frequently he condemns the position taken by Macon, and frankly states that the conduct of North Carolina, and of Macon as a citizen of North Carolina, in the Revolution was "almost shameful." Nevertheless, while one does not feel that Professor Dodd has hesitated to condemn Macon where he believes him to have been mistaken, one cannot but feel also that some of the limitations of Macon are shared by his biographer. Certainly Professor Dodd realizes the position of the agricultural South far more clearly than he does that of commercial New England; certainly he has not the historian's sympathy with New England Federalism; certainly the statesmanship of Hamilton does not appeal to him. His "John Marshall" comes out with the true Jeffersonian ring, and throughout the book the most distinct impression of Marshall's work that is left with the reader is gained from the statement that "John Marshall had not then [1800] been canonized, and so his decisions were not received as dicta of heaven-born justice" (p. 186). So far as can be gathered from Professor Dodd's chapter on "The Revolution of 1800," that movement was mainly significant because it abolished the "levees" of Adams and dispensed with the "coach and four" of Washington; while of the significance of the Louisiana purchase, so clearly set forth in the masterly chapter of Henry Adams, one learns nothing at all. Finally, it is to be feared that Professor Dodd has as little realization as Macon had of the vital forces at work from 1816 to 1828.

The Sporting Dog. By Joseph A. Graham. Macmillan. 1904.

This work belongs to the American Sportsmen's Series and is attractively illustrated by cuts of its subjects, namely, setters, pointers, retrievers, beagles, foxhounds, and greyhounds. Although Mr. Graham does not overlook entirely bench-show points, he treats of the dog preeminently as an object of sport. Throughout the book he shows a freedom from partisanship too uncommon among writers on such subjects. Indeed, his liberality is likely to shock advocates of the straightbred Llewellin setter, for he makes his classification broad enough to admit the "cold-blooded" Llewellins, hitherto debarred, to a place among the orthodox straightbreds. He has had experience as a sportsman, a breeder, and a patron of field trials, and has, moreover, carefully studied his subject. This embodiment of his knowledge will stand for clean sportsmanship, generously free from pettiness.

Beagle lovers may find their favorite somewhat briefly dealt with, but greyhound men will rejoice in the admirable treatise on coursing hounds. Foxhounds are accorded none too much space, but the status of the foxhound in America is well defined. The pointing bird dogs naturally receive the greatest share of attention, and the setter seems to be the favorite of the author, as it is generally of the sporting public. Mr. Graham sketches the history of the Llewellin setter in America, and by good descriptions gives a sort of personality to the great field-trial champions and producers, such as Gladstone, Count Noble, Gath, Roderigo, Antonio, Gladstone IV., Marie's Sport, Tony Boy, Lady's Count Gladstone, and Mohawk. His account will interest everybody who owns a dog descended from these heroes. What he has to say of "class" in field-trial dogs should impress on breeders the value of this quality when transmitted to dogs for the South and West, where wide ranging is the prime essential. His opinion that orange and white is, from the viewpoint of utility, the best color combination, the reviewer cannot agree with, and would suggest, from both science and personal experience, the superior utility of a white-backed dog with under-parts heavily marked with black.

Probably many bench-show men will disagree with Mr. Graham in his statement that Cincinnatus's Pride is, in all-around quality, the best dog shown for years. He may be the best combined bench-show winner and field-trial performer, but in bench quality he is clearly inferior to at least half-a-dozen dogs shown in New York within the last two years. Still more open to question is the assertion that Ulverstone Rap is the best Laverack in America. It is unfair, however, to expect the author to be as able a judge of bench dogs as he is of shooting dogs. Not only will his work be an authority on its subject, but it will give pleasure and satisfaction to every reader who loves the sporting dog.

Dictionary of Historical Allusions. By Thomas Benfield Harbottle. E. P. Dutton & Co. 1903.

We shall not pretend that this is a satisfactory work. It is too short, its subjects might have been more judiciously chosen, and it is not scrupulously accurate. We cite a few passages which require little or no comment: *"Oath of Strasburg.* The oath of allegiance taken

by Charles and Louis, the sons of Louis le Débonnaire, to their brother Lothair, the Emperor, after the battle of Fontenay in 841." Under *"Verdun, Treaty of,"* Charles the Bald, Louis and Lothair are called the sons of Charlemagne. *"Treuga Dei.* The Truce of God, imposed upon all the vassals of the Empire who were at war amongst themselves, by an edict of the Emperor, Henry III. [*sic*], issued at the Diet of Constance in 1403." But the *Treuga Dei* goes back to the first half of the eleventh century. *"Paladins.* A select band of knights in the service of Charlemagne, the most famous of whom was Roland or Orlando. Most of them were killed at the Battle of Roncesvalles, where Charlemagne's troops were defeated by the Moors [*sic*] in 778." Whether or not this definition would pass muster in a dictionary of *literary* allusions, it is out of place here. *"Renaissance.* The revival of learning in Italy in the fifteenth century. It was largely due to the advent in the West of many Greek scholars who fled from Constantinople on its capture by the Turks in 1453, and introduced the masterpieces of Greek literature for the first time to the scholars of the West." Apparently Mr. Harbottle is unaware that Greek had been taught in Italy for more than fifty years prior to 1453. *"Mulmutine Laws.* A code of laws said to have been drawn up by Mulmutius, King of the Britons, *circ.* 400 B. C. They were translated by Alfred the Great, and remained the basis of English law until the Conquest." *"Canada Act.* An act passed in 1774, giving a constitution to Canada." *"Magdeburg, Sack of.* At the capture of Magdeburg by the Austrian General Tilly, in 1629," etc. *"Landsgemeinde.* The ancient popular assembly in the Forest Cantons of Switzerland. Every male above the age of sixteen had access to it. It elected the chief magistrate (Landamman), levied taxes, and exercised judicial functions." One would hardly infer from this statement that the Landsgemeinde still exists in several cantons of Switzerland. In the notice of the League of Cambray no reference is made to Julius II., and the essential features of the Treaty of Bärwalde are left out. By an obvious misprint the Day of Dupes is placed in 1603, and perhaps it is a misprint which gives 1780 as the date of Mme. Guyon and the Quietists. Mr. Harbottle thinks that the Man in the Iron Mask wore a mask of iron, and notices *Compte Rendu* without saying a word about Necker.

We could easily enlarge this list of slips and extravagances were it necessary to do so. Of course it is an easy matter to find errors in any book of reference where the dimensions are considerable, but here the dimensions are not considerable and the number of mistakes seems larger than the law allows. Why a book of reference should be printed on thick paper we are unable to conjecture, unless the author is trying to make a little "copy" go a long way. Mr. Harbottle might have doubled his space by using thinner paper. We stated at the outset that the choice of subjects was open to criticism. In illustration we would point to the author's capricious selection of nicknames. But further criticism would only accentuate the points which have been touched upon already.

The English Church from the Accession of Charles I. to the Death of Anne (1625-1714). By the Rev. William Holden Hutton. Macmillan. 1903.

This, the sixth volume in the 'History of the English Church,' edited by the late Dean of Winchester and the Rev. William Hunt, appears before the fifth, which is to cover the reigns of Elizabeth and James the First. With it the purpose of the editors—to provide for the first time an adequate, continuous, and readable history of the English Church in neither too large nor too small a number of volumes, each from the pen of a writer who has given especial attention to the period of which he writes—is nearing its fulfilment. All of the volumes thus far have been of distinct literary and historical merit. Though the single volume by a layman (Dr. James Gairdner's account of the Church under Henry the Eighth and Mary) is perhaps the best of all, the reverend authors of the other parts of the history have done something for their cloth in helping to disprove the universality, at least, of Clarendon's caustic dictum that clergymen "understand the least, and take the worst measure of, human affairs, of all mankind that can read and write."

Mr. Hutton's work is not unworthy of the excellent company it keeps, though it lacks something of the active charm of the previous volumes. This is doubtless due in part to the character of the period of which it treats. An era of misdirected struggle and, in general, of defeat, important and critical though it may be, cannot supply the most inspiring material for composition. But the lack of vigor that is to some degree apparent in the author's picture is due in greater measure to the severe constraint that he has put upon himself, in the interest partly of brevity and partly of what he considers proper unity. He has studiously avoided touching upon the history of other religious bodies in England during the period of the Puritan revolution; he has said as little as possible of the political history of the country during the same period; in fine, he has attempted what is almost an impossibility. So much is assumed that his sketch lacks somewhat of body and life.

The result has reacted upon the author even in the parts of his work that are inherently most interesting. Archbishop Laud is one of the most commanding figures in the whole history of England. To portray him adequately would be to achieve distinction for the entire book. Mr. Hutton has on other occasions dealt with this theme, but here, though we recognize the judiciousness and carefulness of the student, Laud does not stand out solidly and impressively before us, as he does, for example, in the essay of Professor Mozley, or in the sparkling sentences of Bishop Creighton. But when we have complained, perhaps unduly, of a certain coldness in manner, we have uttered the only complaint that the book arouses. It is richly stored with material within the range to which the author has confined himself, and his treatment is thoughtful and appreciative. The publishers are to be thanked for the excellent specimens of bookmaking that the series affords, and the respective authors for the ample provision of maps, chronological tables, and indexes. It is to be hoped that the death of Canon Overton is not destined to deprive us of the promised concluding volume from his pen, which his minute and sympathetic knowledge of England in the eighteenth century made him, above all others, the one writer to furnish.

A Century of Expansion. By Willis Fletcher Johnson. With maps and index. New York: The Macmillan Co. 1903. Pp. 316.

Mr. Johnson's purpose is to treat step by step the territorial development of the United States; so he opens his narrative with a definition of the term "expansion," which becomes so elastic in his treatment that he credits Virginia with having inaugurated the policy of expansion—that is, natural growth—and crowns the Republican party for having consummated it in the forcible and unnecessary annexation of the Philippines. The book—pleasingly written, be it said in partial extenuation, and to a certain extent logically developed—is to be regretted for two reasons: first, because the spirit of it is pernicious, the course of our history being viewed through the jaundiced eye of the Jingo; and, second, because of inexcusable carelessness in dealing with facts. On the first point, what more need be said than that the author reads in the Louisiana Purchase a forecast (p. 126) of the "annexation of Alaska, of Hawaii, and of the Philippines"; that he deems it "ill-advised and mischievous" to have withdrawn from Cuba? To these pronouncements let us add that in his view (p. 276) the Spanish authority in the Philippines at the time of the American occupation was unchallenged by the inhabitants of the islands, who (p. 285) "wanted to be under the sovereignty of the United States."

The author, to consider charge two, persists in the obsolescent idea that the West, at the end of the eighteenth century, was rebellious, and that, under first-rate leadership, she might have struck fortunes with Spain, then intrenched in Louisiana. There has not survived in American history a ranker fallacy; and as for discrediting the genius of James Wilkinson for intrigue, it is clear that to Mr. Johnson the devious ways of the general—who so securely ensnared Burr and deluded Jefferson—are unknown. The Genet business, too, has been thoroughly misunderstood (pp. 68-69), though enlightenment might have been found in certain publications of the American Historical Association, and in the text of the Treaty of Alliance with France, in connection with the discussion of the measures proposed by the intrepid Frenchman.

To a great many it will be edifying to learn that the Louisiana Purchase (p. 97) included, by inference, West Florida, and that Texas had neither part nor parcel in it. The whole question of the Floridas (pp. 129-132) is bungled—West Florida and East Florida are inextricably confused in the narrative. Mr. Johnson apparently overlooked the dispute which arose over the former under the terms of the Louisiana Purchase, and utterly ignored the revolution of 1810 which determined its fate, leading to its incorporation with Mississippi Territory. The question of Texas is equally well muddled. First, it is only when we reach page 163 (the Louisiana Purchase

was settled on page 97) that we find the title to Texas to have been at all in dispute; but the essentials of the controversy are nowhere given. Concerning the eastern boundary, we have (p. 163): "Spain, on the other hand, insisted that Louisiana stopped at the Sabine River." The eastern boundary claimed by Spain was the Arroyo Hondo, sixty miles or so to the east of the Sabine, and it was here in 1806 that the armies of the two countries stood facing one another and under orders the fulfilment of which meant war. The Neutral Ground Treaty, perhaps the most corrupt in our history, was now negotiated by Wilkinson; the effect of it was practically to abandon our claim to Texas. Yet there is no mention of it.

President Jackson's position on the proposition to annex Texas is put in an entirely false light, as false as the author's declaration that Jackson thought Burr, in his conspiracy, "really cherished hostile designs against the United States" (p. 137). Here, it may be pointed out, as typically slipshod, that James Long in 1819 is made to declare the independence of Texas; and that the date of the battle of San Jacinto is given as April 27, 1836. But the acme of partisanship and historical inaccuracy is reached when the author avers (Texas was knocking at the door of the Union):

"Hitherto, Texas had claimed nothing farther west and south than the Nueces River as the boundary between her and Mexico. Now, at Jackson's suggestion, the claim was pushed to the Rio Bravo or Rio Grande del Norte. But even this was not sufficient to satisfy the rapacity of Jackson and his followers. Mexico was actually willing, in her helplessness and despair, to relinquish her claim upon Texas and to yield to the United States the whole country, not only to the Nueces, but also to the Rio Grande" (p. 172).

Mr. Johnson's historical judgments are equalled only by his generalizations. Who that is acquainted with Spanish-American history, even in the alphabet, would declare the date is 1810 (p. 128): "The plotting of Miranda, encouraged by Hamilton, had led to general revolt throughout Central and South America"? Another observation by the author is worthy of mention. He sees (p. 197) only with the close of the Mexican war "the rise of sectionalism in national politics."

The book has five maps and an index, which is not as full as it might be.

JUST PUBLISHED

The Romance of Piscator

By HENRY WYSHAM LANIER. $1.25.

The tale of how the trout and landlocked salmon temporarily lost their magic for Piscator before the mightier spells cast by the Peri; of how he was greatly tempted by Circumstances, of much fishing and an embarrassing climax.

In the Dwellings of the Wilderness

By C. BRYSON TAYLOR. With two decorations in color. $1.25.

The weird adventures of three American engineers in an Egyptian desert, told in such a way that despite the strange things that happen, the reader half feels as does one of the engineers, that it might all be explained by natural causes.

NEW BOOKS **SCRIBNERS**

Of THE AMERICAN NATURAL HISTORY

The New York Sun says: "A great natural history. . . . An ideal animal book. . . . Common sense is the author's marked characteristic. Nothing healthier can be imagined for those who have been wading through the artistic sentimental slop that passes for Natural History."

The Brooklyn Eagle says: "It is a work of dignity and importance, of large size, profusely illustrated and written with intent to appeal to the average reader who is interested in animals."

By W. T. HORNADAY, Director of the New York Zoological Park. In an 8vo volume, double column page, profusely illustrated. $3.50 *net* (carriage extra).

MANKIND IN THE MAKING

By H. G. WELLS

Author of "Anticipation," etc.

"A book which every one should read."—*London Daily Telegraph.*

A striking and unusual book, suggesting a new point of view in the consideration of human affairs. It has had a very marked success in England.

12mo. $1.50 net (postage extra).

OVERTONES: A Book of Temperaments

By JAMES HUNEKER

Author of "Mezzotints of Modern Music," etc.

With frontispiece portrait of Richard Strauss. 12mo. $1.25 net. (Postage 12 cents.)

"As he is master of the most forcible of English, and has an enormous amount of research and experience to back his views, a volume of essays from his pen is a very important musico-literary work."—*Louis C. Elson.*

Abbott's First Latin Writer

By MATHER A. ABBOTT, Master in Groton School.

Price, 60 cents

THE thirty-seven lessons contained in this book furnish an introduction to the study of Latin composition, which is particularly suitable for students who have completed some first year Latin book. Only the fundamental rules are set forth, and these are expressed so simply that they may be readily understood by the youngest pupils, yet with such fulness that references to grammars have been made unnecessary. Exceptions, unless of great importance, have been disregarded. The exercises in composition have been taken from the second book of Caesar's Gallic War. The lesson vocabularies and examples have been chosen with great care, and consist of those words which occur most frequently in Caesar. In the English-Latin vocabulary at the end of the book the words are given with the accompanying construction where any peculiarity exists.

The Trail Makers

AN AMERICAN EXPLORATION SERIES

PROF. JOHN BACH MCMASTER, CONSULTING EDITOR

With Introductions, Illustrations, and Maps. 10 Volumes. 12mo. $1.00 net (postage 8c.) per vol.

THE demand for convenient and comparatively inexpensive editions of famous American travels, voyages and journals which are of permanent historical importance, has led MESSRS. A. S. BARNES & COMPANY to present new editions of the celebrated books offered in the following list, forming a set of ten volumes, representing six titles:

THE TRAIL MAKERS

The First Explorer of the West

The Journey of Coronado, 1540-42, From the City of Mexico to the Buffalo Plains of Kansas and Nebraska.

Translated and Edited, with an Introduction by George Parker Winship.

First Across the Continent

Voyages from Montreal Through the Continent of North America to the Frozen and Pacific Oceans in 1789 and 1793.

By Alexander Mackenzie. In two volumes.

The Greatest American Exploration

History of the Expedition Under the Command of Captains Lewis and Clark to the Sources of the Missouri, Across the Rocky Mountains, Down the Columbia River to the Pacific in 1804-6.

With an account of the Louisiana Purchase, by Prof. John Bach McMaster, and an introduction identifying the route, by Ripley Hitchcock. In three volumes.

A Contemporary Life of the Famous Iroquois

The History of the Five Indian Nations of Canada Which Are Dependent Upon the Province of New York.

By Cadwallader Colden. Surveyor-General of the Colony of New York. In two volumes.

An Early Fur Trader's Life Among the Indians

A Journal of Voyages and Travels in the Interior of North America

By Daniel Williams Harmon, a partner in the Northwest Company (beginning in 1800).

Across the Continent in Sub-Arctic America

The Wild Northland. The Story of a Winter Journey with Dogs Across Northern North America, 1872-73.

By Gen. Sir Wm. Francis Butler, K. C. B.

A. S. BARNES & CO., Publishers
156 Fifth Avenue, New York

Published This Week

Mr. **MAURICE HEWLETT'S** *new novel*

The Queen's Quair

The plot of this intense, enthralling story covers the six stormy years of the reign of the young Queen of Scots. Its characters seem to be living men warring around the maddening fascination of Mary Stuart, whom dour John Knox nicknamed "the honeypot." Its centre is this very human, magnetic woman, made alive again, passionately alive, with a power to draw men's love that has been equalled but seldom since the world began. *Cloth, 12mo, $1.50*

These new novels are all good reading

MARGARET HORTON POTTER'S
The Flame Gatherers
A vivid romance of India, dramatic in its action, alive with color. *Cloth, $1.50*

ELIZABETH'S
Adventures in Rügen
By the delightful author of "Elizabeth and Her German Garden," etc. *Cloth, $1.50*

Mr. JACK LONDON'S
The Faith of Men
Tingling with such life as is pictured in "The Call of the Wild." *Cloth, $1.50*

Mrs. KINGSLEY'S
The Singular Miss Smith
A very modern love story, timely and particularly amusing. *Illustrated. Cloth, $1.25*

ONOTO WATANNA'S
Daughters of Nijo
A Japanese love story describing the old court life and the new. *Illustrated by* KIYOKICHI SANO. *Cloth, $1.50*

Mr. SAMUEL MERWIN'S
The Merry Anne
Love and smuggling on the Lakes, described with crisp, fresh realism. *Illustrated. Cloth, $1.50*

Not fiction, but good summer reading

Mrs. THEODORE THOMAS'S **Our Mountain Garden** *Just ready*
A true and delightful account of a garden made without hose, hotbed, or professional help, with little horticultural knowledge and less money. *Illustrated. Cloth, $1.50 net.* (Postage 12c.)

Dr. JOHN WILLIAMS STREETER'S **The Fat of the Land** *Fourth Edition*
The story of an American Farm, fascinating as a novel—a book to create envy. *Cloth, $1.50 net.* (Postage 12c.)

THE MACMILLAN COMPANY, *its publishers, beg to announce also that the new novel by* **Mr. Winston Churchill,** *entitled* **"The Crossing,"** *probably the most eagerly awaited issue in the year's output of fiction, will be published next week, May 25, at*

66 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, MAY 19, 1904.

The Week.

It is quite evident that this year's political campaign is to be conducted in a very soldierly fashion. There are to be no loose ends. Unlike the Russians in Mantchuria, the different Republican groups will not be allowed to fire upon each other. Dissensions within the party no doubt keep the blood circulating in time of peace, but with the enemy in sight there can be but one mind and purpose. The Iowa State Convention will show how the thing must be done. Gov. Cummins is all very well in his proper place, but in a Presidential year his proper place is far in the rear. The "Iowa idea" is as much a misfit in 1904 as the Massachusetts idea, and should be treated in exactly the same way. On the eve of their State Convention the Massachusetts Republicans were casting sheep's-eyes on Canadian reciprocity. This, however, was promptly nipped in the bud. Lodge brought the official platform from Washington, and the convention dutifully abandoned the Massachusetts idea for the American idea. On the eve of the Iowa Convention "nothing is heard but stand-pat talk." Senator Allison and Secretary Shaw "have been apprised of the wishes of President Roosevelt," and the platform will be written accordingly. This is much the safest way to do the business. The Republican creed was laid down at the Vermont Convention by Senator Foraker, and it is only necessary that the other States should construct their platforms after the pattern of his speech, care being taken to have a Lodge or an Allison on the spot to see that no inadvertences occur. The President's success in making Congress do the right thing every time in the last six months was an excellent preparation for the task of making the State conventions toe the mark.

Not even the sense of humor is to be left free at the Chicago Convention, apparently. The Administration has, the *Tribune* announces, kindly prepared in advance the platform endorsing the Administration. It is a relief to know that the Administration thinks so well of itself. It defines itself as both conservative and fearless, cautious yet bold, wise, pure, and strong. This must be true, for the Administration itself has said it, and Lodge stands ready to swear to it. Congressman Williams told the Republicans that they were not going to hold a convention, but a meeting to ratify whatever the President had said or done. But he did not foresee that even an inspired platform would be issued by the Administration. Had he done so, he would probably have warned it against what he once called the "ungentlemanly vice" of taking itself too seriously.

We rub our eyes as we read of a mass meeting in Faneuil Hall to demand reciprocity with Canada; of 30,000 business men of Massachusetts petitioning for it; and of the most influential Republicans in the State (not members of Lodge's machine) putting through resolutions calling for it. This is flat rebellion. Lodge has publicly told the party in Massachusetts that reciprocity is a Democratic policy, and privately declared that no good Republican could adopt it and live—that is, live politically. The great sensation of Monday night's meeting was the statement that Lodge had virtually threatened members of the Legislature with political destruction if they did not smother their convictions in favor of reciprocity. Hence the meeting substantially resolved itself into a defiance of the "one power behind the throne in Massachusetts"—namely, the junior Senator. Resolutions antagonistic to him were carried "with a shout." All which, according to Lodge, shows that these Republicans are already proved to be little better than false knaves.

The withdrawal of ex-Mayor Reed of Kansas City, with the consequent clinching of the nomination of Joseph W. Folk as Governor of Missouri, is an admirable illustration of the final futility of machine control. As county conventions have succeeded each other, and Folk's name has roused the first genuine enthusiasm shown in State politics for years, the machine organs have run the gamut from open ridicule to a very reluctant acquiescence. While the young Circuit Attorney's candidacy has swept Missouri with the completeness and something of the spectacular effect of a prairie fire, the machine strongholds have smouldered in the way that a half-dry swamp does when surrounded by a conflagration. With the surrender of Reed, Kansas City seems to have become a strong Folk town, and it is possible that St. Louis may give way and withdraw its Boss Butler candidate before the State Convention meets in June. Meanwhile, talk of Republican success and of Folk for Vice-President must lose effectiveness, as it is so plainly machine labelled.

The decision of the Supreme Court of the United States, barring out John Turner, the anarchist, lays down the broad principle that Congress may exclude any alien "in such cases and on such conditions as it may see fit to prescribe." The full text of the decision is not yet at hand, but the court evidently considered the legal power of Congress, without regard to the wisdom or reasonableness of the particular ground of exclusion. This ruling, indeed, is in line with that regarding the Chinese. The cases and conditions may be whimsical—color of skin, eyes, or hair; views of religion, political theories—but, Congress once having passed the law, there is no appeal; the alien must bow in submission. Whatever may be the rights of residents or citizens of the United States as to freedom of speech or of the press, as to assembly and petition for the redress of grievances, the alien who "is not permitted to enter this country, or, having entered contrary to law, is expelled," is "cut off from worshipping or speaking or publishing or petitioning in the country . . . merely because of his exclusion therefrom. He is not one of the people to whom these things are secured, and cannot become such by an attempt forbidden by law." John Turner indubitably came under the operation of the law, for he was an avowed anarchist, said to belong to the "philosophical" school, which does not advocate violence. A clearer case for a test of the statute could not have been found. For Turner himself no one can have special sympathy, for he seems to have been rather a poor creature, lacking in both force and ideas, certainly not a leader whose suffering could assume the dramatic aspects of a martyrdom. But neither the validity of the law, nor our want of personal interest in the first man to feel its force, should blind us to its radical defects.
